- Applicable WQBELs/WLAs in Attachments M and N of the LA County MS4 Permit according to the milestones set forth in their EWMP;
- Improved water quality in MS4 discharges and receiving waters;
- Stormwater retention milestones; and
- Multi-year efforts that were not completed in the current year and will continue into the subsequent year(s), among other requirements.

As part of the adaptive management process, the Permittees shall also re-evaluate their Category 2 and Category 3 water quality priorities based on data collected through their Coordinated Integrated Monitoring Program (CIMP) for the Permittees' discharges. Where new water quality priorities are identified, the Permittees shall conduct a RAA for the pollutants and identify and incorporate into their EWMP appropriate watershed control measures to address them.

The Permittees' evaluation of the above shall be based on both progress implementing actions in the EWMP and an evaluation of outfall-based monitoring data and receiving water monitoring data. Per Attachment E, Part XVIII.6 of the LA County MS4 Permit, the Permittees shall implement adaptive management strategies, including but not limited to:

- Refinement and recalibration of the Reasonable Assurance Analysis (RAA) based on data specific to the Group's EWMP area that are collected through the Group's CIMP and other data, as appropriate;

- Identifying the most effective control measures, why they are the most effective, and how other control measures can be optimized based on this understanding;
- Identify the least effective control measures (i.e. catch basin inserts), why they are ineffective, and how the control measures can be modified or replaced to be more effective;
- Identify significant changes to control measures during the prior year(s) and the rationale for the changes; and
- Describe all significant changes to control measures anticipated to be made in the next year(s) and the rationale for each change.

As part of the adaptive management process, any modifications to the EWMP, including any requests for extension of deadlines not associated with TMDL provisions, must be submitted to the Los Angeles Water Board for review and approval. The Permittees must implement any modifications to the EWMP upon approval by the Los Angeles Water Board or its Executive Officer, or within 60 days of submittal of modifications if the Los Angeles Water Board or its Executive Officer expresses no objections. Note that while the first adaptive management process is scheduled for April 18, 2018, the Group's ROWD is due no later than July 1, 2017. The Group should conduct a preliminary evaluation of its EWMP in the spring of 2017 and present the results of the evaluation and any proposed modifications to the EWMP in the Group's ROWD.

The Los Angeles Water Board appreciates the participation and cooperation of the Permittees in the Beach Cities Watershed Management Group in the implementation of the LA County MS4 Permit. If you have any questions, please contact Ms. Erum Razzak of the Storm Water Permitting Unit at Erum.Razzak@waterboards.ca.gov or by phone at (213) 620-2095. Alternatively, you may also contact Mr. Ivar Ridgeway, Chief of the Storm Water Permitting Unit, at Ivar.Ridgeway@waterboards.ca.gov or by phone at (213) 620-2150.

Sincerely,

Samuel Unger, P.E.
Executive Officer

ORDER NO. 01-182
NPDES PERMIT NO. CAS004001
WASTE DISCHARGE REQUIREMENTS
FOR
MUNICIPAL STORM WATER AND URBAN RUNOFF DISCHARGES WITHIN THE
COUNTY OF LOS ANGELES, AND THE INCORPORATED CITIES THEREIN,
EXCEPT THE CITY OF LONG BEACH

The California Regional Water Quality Control Board, Los Angeles Region (hereinafter referred to as the Regional Board) finds:

A. Existing Permit

The Los Angeles County Flood Control District, the County of Los Angeles, and 84 incorporated cities within the Los Angeles County Flood Control District (see Attachment A, List of Permittees), hereinafter referred to separately as Permittees and jointly as the Discharger, discharge or contribute to discharges of storm water and urban runoff from municipal separate storm sewer systems (MS4s), also called storm drain systems. The discharges flow to water courses within the Los Angeles County Flood Control District and into receiving waters of the Los Angeles Region. These discharges are covered under countywide waste discharge requirements contained in Order No. 96-054 adopted by this Regional Board on July 15, 1996, which replaced Order No. 90-079 adopted by this Regional Board on June 18, 1990. Order No. 96-054 also serves as a National Pollutant Discharge Elimination System (NPDES) permit for the discharge of municipal storm water.

B. Nature of Discharges and Sources of Pollutant

1. Storm water discharges consist of surface runoff generated from various land uses in all the hydrologic drainage basins that discharge into water bodies of the State. The quality of these discharges varies considerably and is affected by the hydrology, geology, land use, season, and sequence and duration of hydrologic events. The primary constituents of concern currently identified by the Los Angeles County Flood Control District Integrated Receiving Water Impacts Report (1994-2000) are cyanide, indicator bacteria, total dissolved solids, turbidity, total suspended solids, nutrients, total aluminum, dissolved cadmium, copper, lead, total mercury, nickel, zinc, bis(2-ethylhexyl)phthalate, polycyclic aromatic hydrocarbons (PAHs), diazinon, and chlorpyrifos.
2. Certain pollutants present in storm water and/or urban runoff may be derived from extraneous sources that Permittees have no or limited

jurisdiction over. Examples of such pollutants and their respective sources are: PAHs which are products of internal combustion engine operation, nitrates, bis (2-ethylhexyl) phthalate and mercury from atmospheric deposition, lead from fuels, copper from brake pad wear, zinc from tire wear, dioxins as products of combustion, and natural-occurring minerals from local geology. However, the implementation of the measures set forth in this Order is intended to reduce the entry of these pollutants into storm water and their discharge to receiving waters.

3. Water quality assessments conducted by the Regional Board identified impairment, or threatened impairment, of beneficial uses of water bodies in the Los Angeles Region. The causes of impairments include pollutants of concern identified in municipal storm water discharges by the County of Los Angeles in the Integrated Receiving Water Impacts Report (1994-2000). Pollutants in storm water can have damaging effects on both human health and aquatic ecosystems.
4. The Los Angeles County Grand Jury, September 2000, completed an investigation into the health risks of swimming near beaches in Los Angeles County and made several recommendations to reduce public health risks (Final Report, Grand Jury, Los Angeles County, 1999-2000). The Grand Jury recommended that the Regional Board consider among other actions, (i) a focus on setting contaminant limits rather than programmatic evaluations, (ii) audit of MS4 Permittee programs; and (iii) clarifying enforcement responsibilities between the State and local governments.
5. Studies and research conducted by other Regional agencies, academic institutions, and universities have also identified storm water and urban runoff as significant sources of pollutants to surface waters in Southern California. See, e.g., [*Surface Runoff to the Southern California Bight*, Southern California Coastal Water Research Project, (1992); *Impacts of Urban Runoff on Santa Monica Bay and Surrounding Ocean Waters* (Gersberg, R.M., 1995); *State of the Bay 1998*, Santa Monica Bay Restoration Project; *Storm Water Impact*, In, Southern California Environmental Report Card 1999, Institute of the Environment, University of California, Los Angeles (Stenstrom, M.S., 1999); *Distribution of Anthropogenic and Natural Debris on the Mainland Shelf of Southern California Bight*, Shelly L. Moore and M. James Allen (1999); *The Health Effects of Swimming in Ocean Water Contaminated by Storm Drain Runoff*, Haile, R.W. et al. (1999); *Huntington Beach Closure Investigation: Technical Review* (University of Southern California, 2000); *A Regional Survey of the Microbiological Water Quality Along the Shoreline of the Southern California Bight*, Rachel T. Noble et al. (2001); *Integrated Receiving Water Impacts Report (1994-2000)*, County of Los Angeles (2001)].
6. Development and urbanization increase pollutant load, volume, and discharge velocity. First, natural vegetated pervious ground cover is converted to impervious surfaces such as paved highways, streets, rooftops and parking lots. Natural vegetated soil can both absorb rainwater and remove pollutants providing an effective natural purification

process. In contrast, pavement and concrete can neither absorb water nor remove pollutants, and thus the natural purification characteristics are lost. Second, urban development creates new pollution sources as the increased density of human population brings proportionately higher levels of vehicle emissions, vehicle maintenance wastes, municipal sewage waste, pesticides, household hazardous wastes, pet wastes, trash, and other anthropogenic pollutants. Development and urbanization especially threaten environmentally sensitive areas. Such areas have a much lower capacity to withstand pollutant shocks than might be acceptable in the general circumstance. In essence, development that is ordinarily insignificant in its impact on the environment may in a particular sensitive environment become significant. These environmentally sensitive areas designated by the State and/or the County of Los Angeles include Areas of Special Biological Significance (ASBS), water bodies designated as supporting a RARE beneficial use, Significant Natural Areas (SNAs), and Significant Ecological Areas (SEAs).

7. The increased volume, increased velocity, and discharge duration of storm water runoff from developed areas has the potential to greatly accelerate downstream erosion and impair stream habitat in natural drainages. Studies have demonstrated a direct correlation between the degree of imperviousness of an area and the degradation of its receiving waters. Significant declines in the biological integrity and physical habitat of streams and other receiving waters have been found to occur with as little as 10 percent conversion from natural to impervious surfaces. Percentage impervious cover is a reliable indicator and predictor of potential water quality degradation expected from new development. (*Impervious Cover as An Urban Stream Indicator and a Watershed Management Tool*, Schueler, T. and R. Claytor, In, *Effects of Water Development and Management on Aquatic Ecosystems* (1995), ASCE, New York; Leopold, L. B., (1973), *River Channel Change with Time: An Example*, Geological Society of America Bulletin, v. 84, p. 1845-1860; Hammer, T. R., (1972), *Stream Channel Enlargement Due to Urbanization: Water Resources Research*, v. 8, p. 1530-1540; Booth, D. B., (1991), *Urbanization and the Natural Drainage System--Impacts, Solutions and Prognoses: The Northwest Environmental Journal*, v. 7, p. 93-118; Klein, R. D., (1979), *Urbanization and Stream Quality Impairment: Water Resources Bulletin*, v. 15, p. 948-963; May, C. W., Horner, R. R., Karr, J. R., Mar, B. W., and Welch, E. B., (1997), *Effects of Urbanization on Small Streams in the Puget Sound Lowland Ecoregion: Watershed Protection Techniques*, v. 2, p. 483-494; Morisawa, M. and LaFlure, E. *Hydraulic Geometry, Stream Equilibrium and Urbanization* In Rhodes, D. P. and Williams, G. P. *Adjustments to the Fluvial System* p.333-350. (1979); Dubuque, Iowa, Kendall/Hunt. Tenth Annual Geomorphology Symposia Series; and *The Importance of Imperviousness: Watershed Protection Techniques*, 1(3), Schueler, T. (1994).)
8. The County of Los Angeles has identified as the seven highest priority industrial and commercial critical source types, (i) wholesale trade (scrap recycling, auto dismantling); (ii) automotive repair/parking; (iii) fabricated

metal products; (iv) motor freight; (v) chemical and allied products; (vi) automotive dealers/gas stations; (vii) primary metal products (*Critical Source Selection and Monitoring Report*, Los Angeles County Department of Public Works -Sept 1996). Monitoring conducted by Los Angeles County and the Regional Board demonstrates that the priority industrial sectors and auto repair facilities (one of the commercial sectors) on the list, contribute significant concentrations of heavy metals to storm water (*Los Angeles County 1999-2000 Storm Water Monitoring Report*, Los Angeles County Department of Public Works -July 2000; *Compliance Assessment of the Auto Dismantling Industry; Evaluation of the California General Industrial Storm Water Permit*, H. Chang, (2001), 70 pp., California Regional Water Quality Control Board, Los Angeles Region).

9. The discharge of washwaters and contaminated storm water from industries and businesses specified in this Order for inspection by Permittees is an environmental threat and can also adversely impact public health and safety. For example, a review of industrial waste/pretreatment records performed in 1995 in the County of Los Angeles on illicit discharges indicates that automotive service facilities and food service facilities sometimes discharge polluted washwaters to the MS4. The pollutants of concern in such washwaters include food waste, oil and grease, and toxic chemicals. Other storm water/industrial waste programs in California have reported similar observations. Illicit discharges from automotive service facilities and food service facilities have been identified elsewhere as a major cause of widespread contamination and water quality problems (Washtenaw County Statutory Drainage Board - 1987 Huron River Pollution Abatement Program).
10. Studies indicate that facilities with paved surfaces subject to frequent motor vehicular traffic (such as parking lots and fast food restaurants), or facilities that perform vehicle repair, maintenance, or fueling (automotive service facilities) are potential sources of pollutants of concern in storm water. [References: Pitt *et al.*, *Urban Storm Water Toxic Pollutants: Assessment, Sources, and Treatability*, Water Environment Res., 67, 260 (1995); *Results of Retail Gas Outlet and Commercial Parking Lot Storm Water Runoff Study*, Western States Petroleum Association and American Petroleum Institute, (1994); *Action Plan Demonstration Project, Demonstration of Gasoline Fueling Station Best Management Practices*, Final Report, County of Sacramento (1993); *Source Characterization*, R. Pitt, In *Innovative Urban Wet-Weather Flow Management Systems* (2000) Technomic Press, Field, R *et al.* editors; *Characteristics of Parking Lot Runoff Produced by Simulated Rainfall*, L.L. Tiefenthaler *et al.* Technical Report 343, Southern California Coastal Water Research Project (2001).]
11. Retail Gasoline Outlets (RGOs) are points of convergence for vehicular traffic and are similar to parking lots and urban roads. Studies indicate that storm water discharges from RGOs have high concentrations of hydrocarbons and heavy metals. [*The Quality of Trapped Sediments and Poor Water within Oil Grit Separators in Suburban MD*, Schueler T. and

Shepp D. (1992), and *Concentrations of Selected Constituents in Runoff from Impervious Surfaces in Four Urban Catchments of Different Landuse*, Ranabal, F.I., and T.J. Gizzard (1995), In Proceedings of the Fourth Biennial Stormwater Research Conference, Florida, pp-42-52]. Pilot studies indicate that treatment control best management practices installed at retail gasoline stations are effective in removing pollutants, reasonable in capital cost, easy to operate, and do not present safety risks [*Rouge River National Wet Weather Demonstration Project, Task Product Memorandum – Evaluation of On-line Media Filters RPO-NPS-TPM59.00*, Wayne County, MI, March 1999]. The Regional Board and the San Diego Regional Board have jointly prepared a Technical Report on the applicability of new development BMP design criteria for retail gasoline outlets, (*Retail Gasoline Outlets: New Development Design Standards for Mitigation of Storm Water Impacts*, (June 2001)). Retail Gasoline Outlets in Western U.S. States (such as Washington and Oregon) are already subject to numerical BMP design criteria, as well in other U.S. States.

C. Permit Background

1. The essential components of the Storm Water Management Program, as established by federal regulations [40 CFR 122.26(d)] are: (i) Adequate Legal Authority, (ii) Fiscal Resources, (iii) Storm Water Quality Management Program (SQMP) - (Public Information and Participation Program, Industrial/Commercial Facilities Program, Development Planning Program, Development Construction Program, Public Agency Activities Program, Illicit Connection and Illicit Discharges Elimination Program), and (iv) Monitoring and Reporting Program.
2. The Permittees have filed a Report of Waste Discharge (ROWD), dated February 1, 2001, and applied for renewal of their waste discharge requirements that serves as an NPDES permit to discharge wastes to surface waters. The ROWD includes a proposed SQMP and a Monitoring Program. The proposed SQMP contains programs previously approved under Board Order No. 96-054 in the following areas:

Public Information and Participation
Development Planning
Development Construction
Public Agency Activities
Illicit Connection/Illicit Discharge Elimination Program

These programs are revised pursuant to the provisions of this Order after adoption.

3. The County of Los Angeles has previously conducted source identification and pollutant characterization consistent with 40 CFR 122.26(d)(1)(ii) and (iii) under its storm water Monitoring Program. The Monitoring Program submitted with the ROWD proposes to advance the assessment of receiving water impacts, identification of sources of pollution, evaluation of Best Management Practices (BMPs), and measurement of long term trends in mass emissions.

4. The Regional Board has reviewed the ROWD and has determined it to be complete under the reapplication policy of MS4s issued by the U.S. Environmental Protection Agency (USEPA) (61 *Fed. Reg.* 41697). The Regional Board finds that the Permittees' proposed SQMP, incorporating the additional and/or revised provisions contained in this Order would meet the minimum requirements of federal regulations.
5. The City of Los Angeles has conducted shoreline and nearshore water quality monitoring off the Santa Monica Bay since the 1950s under the monitoring program for the Hyperion Waste Water Treatment Plant (NPDES No. CA0109991). The monitoring results indicate that effluent from Hyperion's 5-Mile Outfall does not impinge the shoreline, and that elevated bacterial counts are associated with runoff from storm drains and discharges from piers. In 1994, the Regional Board approved the relocation of Hyperion's shoreline stations to implement a bay-wide, regional shoreline-monitoring program associated with storm drain outfalls in the Santa Monica Bay. The City of Los Angeles requested that the shoreline-monitoring requirement be incorporated in this Order. The shoreline pathogen monitoring requirements are outlined in the Monitoring Program for this Order.

D. Permit Coverage

1. The requirements in this Order cover all areas within the boundaries of the Permittee municipalities (see Attachment A) over which they have regulatory jurisdiction as well as unincorporated areas in Los Angeles County within the jurisdiction of the Regional Board. The Permittees serve a population of about 9.5 million [Reference: *2000 Census of Population and Housing*, Bureau of the Census, U.S. Department of Commerce (2001)] in an area of approximately 3,100 square miles.
2. Federal, state, regional or local entities within the Permittees' boundaries or in jurisdictions outside the Los Angeles County Flood Control District, and not currently named in this Order, may operate storm drain facilities and/or discharge storm water to storm drains and watercourses covered by this Order. The Permittees may lack legal jurisdiction over these entities under state and federal constitutions. The Regional Board will coordinate with these entities to implement programs that are consistent with the requirements of this Order. The Regional Board will consider such facilities for coverage in 2003 under its NPDES permitting scheme pursuant to USEPA Phase II storm water regulations.
3. Sources of discharges into receiving waters in the County of Los Angeles but in jurisdictions outside its boundary include the following:

About 34 square miles of unincorporated area in Ventura County, which drain into Malibu Creek and then to Santa Monica Bay,

About 9 square miles of the City of Thousand Oaks, which also drain into Malibu Creek and then to Santa Monica Bay, and

About 86 square miles of area in Orange County, which drain into Coyote Creek and then into the San Gabriel River.

The Regional Board will ensure that storm water management programs for the areas in Ventura County and the City of Thousand Oaks that drain into Santa Monica Bay are consistent with the requirements of this Order. The Regional Board will coordinate with the Santa Ana Regional Board so that storm water management programs for the areas in Orange County that drain into Coyote Creek are consistent with the requirements of this Order.

4. This permit is intended to develop, achieve, and implement a timely, comprehensive, cost-effective storm water pollution control program to reduce the discharge of pollutants in storm water to the Maximum Extent Practicable (MEP) from the permitted areas in the County of Los Angeles to the waters of the U.S. subject to the Permittees' jurisdiction.
5. Permittees have expressed their intention to work cooperatively to control the contribution of pollutants from one portion of the MS4 to another portion of the system. Permittees may control the contribution of pollutants to the MS4 from non-permittee dischargers such as Caltrans, the U.S. Department of Defense, and other state and federal facilities, through interagency agreements.

E. Federal, State, and Regional Regulations

1. The Water Quality Act of 1987 added Section 402(p) to the federal Clean Water Act (CWA) (33 U.S.C. § 1251-1387). This section requires the USEPA to establish regulations setting forth NPDES requirements for storm water discharges in two phases.
 - The USEPA Phase I storm water regulations were directed at MS4s serving a population of 100,000 or more, including interconnected systems and storm water discharges associated with industrial activities, including construction activities. The Phase I Final Rule was published on November 16, 1990 (55 *Fed. Reg.* 47990).
 - The USEPA Phase II storm water regulations are directed at storm water discharges not covered in Phase I, including small MS4s (serving a population of less than 100,000), small construction projects (one to five acres), municipal facilities with delayed coverage under the Intermodal Surface Transportation Efficiency Act of 1991, and other discharges for which the USEPA Administrator or the State determines that the storm water discharge contributes to a violation of a water quality standard, or is a significant contributor of pollutants to waters of the United States. The Phase II Final Rule was published on December 8, 1999 (64 *Fed. Reg.* 68722).
2. The USEPA published an 'Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits' on August 26, 1996 (61 *Fed. Reg.* 43761). This policy discusses the appropriate kinds of

water quality-based effluent limitations to be included in NPDES storm water permits to provide for the attainment of water quality standards.

3. The USEPA published an 'Interpretative Policy Memorandum on Reapplication Requirements' for MS4 permits on August 9, 1996 (61 *Fed. Reg.* 41697). This policy requires that MS4 reapplication for reissuance for a subsequent five-year permit term contain certain basic information and information for proposed changes and improvements to the storm water management program and monitoring program.
4. The USEPA has entered into a Memorandum of Agreement (MOA) with the U.S. Fish and Wildlife Service and the National Marine Fisheries Service for enhancing coordination regarding the protection of endangered and threatened species under Section 7 of the Endangered Species Act and the CWA's Water Quality Standards and NPDES programs. Among other actions, the MOA establishes a framework for coordination of actions by the USEPA, the Services, and CWA delegated States on CWA permit issuance under Section 402 of the CWA [66 *Fed. Reg.* 11202 – 11217].
5. USEPA regulations at 40 CFR 122.26(d)(2)(iv)(A) and 40 CFR 122.26(d)(2)(iv)(C) require that MS4 permittees implement a program to monitor and control pollutants in discharges to the municipal system from industrial and commercial facilities that contribute a substantial pollutant load to the MS4. The regulations require that permittees establish priorities and procedures for inspection of industrial facilities and priority commercial establishments. This permit, consistent with the USEPA policy, incorporates a cooperative partnership, including the specifications of minimum expectations, between the Regional Board and the Permittees for the inspection of industrial facilities and priority commercial establishments to control pollutants in storm water discharges (58 *Fed. Reg.* 61157).
6. Section 402 (p) of the CWA (33 U.S.C. § 1342(p) provides that MS4 permits must "require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design engineering method and such other provisions as the [EPA] Administrator or the State determines appropriate for the control of such pollutants." The State Water Resources Control Board's (State Board) Office of Chief Counsel (OCC) has issued a memorandum interpreting the meaning of MEP to include technical feasibility, cost, and benefit derived with the burden being on the municipality to demonstrate compliance with MEP by showing that a BMP is not technically feasible in the locality or that BMPs costs would exceed any benefit to be derived (dated February 11, 1993).
7. The CWA authorizes the USEPA to permit a state to serve as the NPDES permitting authority in lieu of the USEPA. The State of California has in-lieu authority for an NPDES program. The Porter-Cologne Water Quality Control Act authorizes the State Board, through the Regional Boards, to regulate and control the discharge of pollutants into waters of the State. The State Board entered into a MOA with the USEPA, on

September 22, 1989, to administer the NPDES Program governing discharges to waters of the U.S.

8. Section 303(d) of the CWA requires that the State identify a list of impaired water-bodies and develop and implement Total Maximum Daily Loads (TMDLs) for these waterbodies (33 U.S.C. §1313(d)(1)). A TMDL specifies the maximum amount of a pollutant that a water-body can receive, still meet applicable water quality standards and protect beneficial uses. The USEPA entered into a consent decree with the Natural Resources Defense Council (NRDC), Heal the Bay, and the Santa Monica BayKeeper on March 22, 1999, under which the Regional Board must adopt all TMDLs for the Los Angeles Region within 13 years from that date. This permit incorporates a provision to implement and enforce approved load allocations for municipal storm water discharges and requires amending the SQMP after pollutants loads have been allocated and approved.
9. Section 6217(g) of the Coastal Zone Act Reauthorization Amendments of 1990 (CZARA) requires coastal states with approved coastal zone management programs to address non-point pollution impacting or threatening coastal water quality. CZARA (16 U.S.C. § 1451-1465) amends the Coastal Zone Management Act of 1972, to address five sources of non-point pollution: agriculture, silviculture, urban, marinas, and hydromodification. This NPDES permit addresses the management measures required for the urban category, with the exception of septic systems. The Regional Board addresses septic systems through the administration of other programs.
10. On May 18, 2000, the USEPA established numeric criteria for priority toxic pollutants for the State of California (California Toxics Rule (CTR)) 65 *Fed. Reg.* 31682 (40 CFR 131.38), for the protection of human health and aquatic life. These apply as ambient water quality criteria for inland surface waters, enclosed bays, and estuaries. The State Board adopted the *Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (SIP) – 2000*, on March 2, 2000, for implementation of the CTR (State Board Resolution No. 2000-15 as amended by Board Resolution No. 2000-030). This policy requires that discharges comply with TMDL-derived load allocations as soon as possible but no later than 20 years from the effective date of the policy.
11. The State Board adopted a revised Water Quality Control Plan for Ocean Waters of California (Ocean Plan) on July 23, 1997. The Ocean Plan contains water quality objectives which apply to all discharges to the coastal waters of California.
12. The State Board in *In Re: California Department of Transportation* (State Board Order WQ 2001-08), determined that the discharge of storm water to ASBS is subject to the prohibition in the Ocean Plan against the discharge of wastes to an ASBS.

13. The Regional Board adopted an updated Water Quality Control Plan (Basin Plan) for the Los Angeles Region on June 13, 1994, '*Water Quality Control Plan, Los Angeles Region: Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties*, (1994).' The Basin Plan designates beneficial uses of receiving waters and specifies both narrative and numerical water quality objectives for the receiving waters in Los Angeles County.
14. The Regional Board on September 19, 2001, adopted amendments to the Basin Plan, to incorporate TMDLs for trash in the Los Angeles River Watershed (Resolution No. R01-013) and Ballona Creek Watershed (Resolution No. R01-014). The amendments were subsequently approved by the State Board, the Office of Administrative Law, and the United States Environmental Protection Agency. Twenty-two cities¹ ("Cities") sued the Regional Board and State Board to set aside the Los Angeles River Trash TMDL. The trial court entered an order deciding some claims in favor of the Water Boards and some in favor of the Cities. Both sides appealed, and on January 26, 2006, the Court of Appeal decided every one of the Cities' claims in favor of the Water Boards, except with respect to California Environmental Quality Act (CEQA) compliance (*City of Arcadia et al. v. Los Angeles Regional Water Quality Control Board et al.* (2006) 135 Cal.App.4th 1392). The Court therefore declared the Los Angeles River Trash TMDL void, and issued a writ of mandate that ordered the Water Boards to set aside and not implement the TMDL, until it had been brought into compliance with CEQA. As a result of the appellate court's decision, in 2006, the Regional Board set aside its 2001 action incorporating the TMDL into the Basin Plan (Resolution R06-013) (*City of Arcadia et al. v. Los Angeles Regional Water Quality Control Board et al.* (2006) 135 Cal.App.4th 1392). After conducting the required CEQA analysis, the Regional Board readopted the Los Angeles River Watershed Trash TMDL on August 9, 2007 (Resolution No. R07-012). This TMDL was subsequently approved by the State Board (Resolution No. 2008-0024), the Office of Administrative Law (File No. 2008-0519-02 S), and the United States Environmental Protection Agency, and became effective on September 23, 2008. The Water Boards filed their final return to the writ of mandate on August 6, 2008, and on August 26, 2008, the superior court entered an order discharging the writ, and dismissing the case, thus concluding the legal challenges to the Trash TMDL.
15. The Regional Board on April 13, 1998, approved BMPs for sidewalk rinsing to minimize the discharge of wash waters to the storm drain system (Resolution No. 98-08). By the same resolution, the Regional Board prohibited the discharge of municipal street wash waters to the storm drain system.

¹ The cities include Arcadia, Baldwin Park, Bellflower, Cerritos, Commerce, Diamond Bar, Downey, Irwindale, Lawndale, Monrovia, Montebello, Monterey Park, Pico Rivera, Rosemead, San Gabriel, Santa Fe Springs, Sierra Madre, Signal Hill, South Pasadena, Vernon, West Covina, and Whittier.

16. The Regional Board on April 13, 1998, approved recommended BMPs for industrial/commercial facilities (Resolution No. 98-08).
17. The Regional Board on April 22, 1999, approved a list of BMPs for use in development planning and development construction (Resolution No. 99-03)
18. The Regional Board adopted and approved requirements for new development and significant redevelopment projects in Los Angeles County to control the discharge of storm water pollutants in post-construction storm water, on January 26, 2000, in Board Resolution No. R-00-02. The Regional Board Executive Officer issued the approved Standard Urban Storm Water Mitigation Plans (SUSMPs) on March 8, 2000. The State Board in large part affirmed the Regional Board action and SUSMPs in State Board Order No. WQ 2000-11 issued on October 5, 2000.
 - The State Board's Chief Counsel has issued a statewide policy memorandum (dated December 26, 2000), which interprets the Order to provide broad discretion to Regional Boards and identifies potential future areas for inclusion in SUSMPs and the types of evidence and findings necessary. Such areas include ministerial projects, projects in environmentally sensitive areas, and water quality design criteria for RGOs.
 - The State Board's Chief Counsel interprets the Order to encourage regional solutions and endorses a mitigation fund or "bank" that may be funded by developers who obtain waivers from the numerical design standards for new development and significant redevelopment.
19. 40 CFR 131.10(a) prohibits states from designating waste transport or waste assimilation as a use for any water of the U.S. Authorizing the construction of a storm water/ urban runoff treatment facility in a jurisdictional water body would be tantamount to accepting waste assimilation as an appropriate use for that water body. Furthermore, the construction and operation of a pollution control facility in a water body can impact the physical, chemical, and biological integrity as well as the beneficial uses of the water body. Therefore, storm water treatment and/or mitigation in accordance with SUSMPs and any other requirements of this Order must occur prior to the discharge of storm water into a water of the U.S.
20. The Regional Board supports a Watershed Management Approach to address water quality protection in the region. The objective of the Watershed Management Approach should be to provide a comprehensive and integrated strategy towards water resource protection, enhancement, and restoration while balancing economic and environmental impacts within a hydrologically defined drainage basin or watershed. It emphasizes cooperative relationships between regulatory agencies, the regulated community, environmental groups, and other

stakeholders in the watershed to achieve the greatest environmental improvements with available resources.

21. To promote a watershed management approach, the County of Los Angeles is divided into six Watershed Management Areas (WMAs) as follows:

Malibu Creek and Rural Santa Monica Bay WMA
Ballona Creek and Urban Santa Monica Bay WMA
Los Angeles River WMA
San Gabriel River WMA
Dominguez Channel/Los Angeles Harbor WMA, and
Santa Clara River WMA

Attachment A shows the list of Permittees under each WMA and some Permittees have expressed an intent to form sub-watershed groups within the WMA to promote regional solutions for the mitigation of storm water discharge pollution.

22. To facilitate compliance with federal regulations, the State Board has issued two statewide general NPDES permits for storm water discharges: one for storm water from industrial sites [NPDES No. CAS000001, General Industrial Activity Storm Water Permit (GIASP)] and the other for storm water from construction sites [NPDES No. CAS000002, General Construction Activity Storm Water Permit (GCASP)]. The GCASP was reissued on August 19, 1999. The GIASP was reissued on April 17, 1997. Facilities discharging storm water associated with industrial activities and construction projects with a disturbed area of five acres or more are required to obtain individual NPDES permits for storm water discharges, or to be covered by a statewide general permit by completing and filing a Notice of Intent (NOI) with the State Board. The USEPA guidance anticipates coordination of the state-administered programs for industrial and construction activities with the local agency program to reduce pollutants in storm water discharges to the MS4.

The Regional Board is the enforcement authority in the Los Angeles Region for the two statewide general permits regulating discharges from industrial facilities and construction sites, and all NPDES storm water and non-storm water permits issued by the Regional Board. These industrial and construction sites and discharges are also regulated under local laws and regulations.

23. The State Board, on October 28, 1968, adopted Resolution No. 68-16, which established an anti-degradation policy for the State and Regional Boards. This policy restricts the degradation of surface waters and protects waterbodies where existing water quality is higher than is necessary for the protection of beneficial uses.
24. The State Board, on June 17, 1999, adopted Order No. WQ 99-05, which, in a precedential decision, identifies acceptable receiving water limitations language to be included in municipal storm water permits issued by the State and Regional Boards. The receiving water limitations included herein are consistent with the State Board Order, USEPA Policy,

and the U.S. Appellate court decision in, *Defenders of Wildlife v. Browner* (9th Cir, 1999). The State Board OCC has determined that the federal court decision did not conflict with State Board Order No. WQ 99-05 (memorandum dated October 14, 1999)

25. California Water Code (CWC) § 13263(a) requires that waste discharge requirements issued by the Regional Board shall implement any relevant water quality control plans that have been adopted; shall take into consideration the beneficial uses to be protected and the water quality objectives reasonably required for that purpose; other waste discharges; the need to prevent nuisance; and provisions of CWC § 13241. The Regional Board has considered the requirements of § 13263 and § 13241, and applicable plans, policies, rules, and regulations in developing these waste discharge requirements.
26. CWC § 13370 *et seq.* requires that waste discharge requirements issued by the Regional Boards be consistent with provisions of the federal CWA and its amendments.
27. On March 12, 2001, the U.S. Court of Appeals ruled that it is necessary to obtain a NPDES permit for application of aquatic pesticides to waterways. (*Headwaters, Inc. vs. Talent Irrigation District*, 243 F.3d. 526 (9th Cir., 2001)) This decision is controlling in California for nonagricultural applications of pesticides to waterways. The State Board adopted a general NPDES permit (Order No. 2001-12-DWQ) on July 19, 2001, for public entities that discharge pollutants to waters of the U.S. associated with the application of aquatic pesticides for resource or pest management. Public entities that conduct such activities must seek coverage under the general permit.

The Marina Del Rey Harbor Mothers' Beach and Back Basins Bacteria TMDL

28. [Intentionally left blank]
29. The Regional Board adopted the Marina del Rey Harbor Mothers' Beach and Back Basins Bacteria TMDL (hereinafter "MDR Bacteria TMDL") on August 7, 2003. The TMDL was subsequently approved by the SWRCB, the OAL, and the USEPA and became effective on March 18, 2004.
30. Tables 7-5.1, 7-5.2, and 7-5.3 of the Basin Plan set forth the pertinent provisions of the MDR Bacteria TMDL.
31. [Intentionally left blank]
32. [Intentionally left blank]

33. On March 14, 2007, Marina del Rey watershed responsible agencies submitted to the Regional Board the results of a non-point source study conducted over a one year period between July 2005 and July 2006, which was required under the terms of the MDR TMDL. The study was designed to determine the relative bacterial loading to the harbor from sources including but not limited to storm drains, boats, birds, and other non-point sources. The study has not yet been peer reviewed, and is currently under review by Regional Board staff.
34. On January 8, 2007, as required by the MDR Bacterial TMDL, Marina del Rey watershed responsible agencies submitted to the Regional Board an implementation plan describing the strategy by which they intend to comply with the MDR Bacterial TMDL. This implementation plan was developed through a process that included both Regional Board staff and representatives from Heal the Bay and Santa Monica Baykeeper.
35. The Regional Board acknowledges the County's timely submittals of reports required by the TMDL and implementation measures initiated thus far towards meeting water quality standards for bacteria in Marina del Rey. As a result of the adoption of the MDR Bacterial TMDL in 2003, the County has funded or received grants to initiate the following activities:
- Marina Beach Water Quality Improvement Project, Phase I and Phase II through a CBI grant;
 - Mothers' Beach and Back Basins Bacterial TMDL Non-point Source Study;
 - Marina del Rey Harbor Mothers Beach and Back Basins Report of Small Drain Identification;
 - Marina del Rey Vessel Discharge Report;
 - Marina del Rey Harbor Mothers' Beach and Back Basins Bacterial TMDL Coordinated Monitoring Plan; and
 - Three low-flow diversion projects, which were partially funded by a grant, two of which have been completed.

In addition to participation in the above studies, the County and other Marina del Rey watershed responsible agencies continue to implement BMPs proposed in the January 8, 2007, Implementation Plan.

Findings Related to the Incorporation of the Los Angeles River Watershed Trash TMDL

40. The Regional Board adopted the Los Angeles River Trash Total Maximum Daily Load (TMDL) on August 9, 2007 as an amendment to the region's Water Quality Control Plan (Basin Plan) to address water quality impairments due to trash in the Los Angeles River Watershed that were identified in 1998 on the State's Clean Water Act Section 303(d) List. This TMDL was subsequently approved by the State Board, the Office of Administrative Law (OAL), and the USEPA, and it became effective on September 23, 2008.
41. By its adoption of the Trash TMDL, the Regional Board determined that trash discharged to the Los Angeles River and its tributaries discourages recreational activity, degrades aquatic habitat, threatens wildlife through ingestion and entanglement, and also poses risks to human health. Existing beneficial uses impaired by trash in the Los Angeles River are contact recreation (REC-1) and non-contact recreation (REC-2); warm fresh water habitat (WARM); wildlife habitat (WILD); estuarine habitat (EST) and marine habitat (MAR); rare, threatened or endangered species (RARE); migration of aquatic organisms (MIGR) and spawning, reproduction and early development of fish (SPWN); commercial and sport fishing (COMM); wetland habitat (WET); and cold freshwater habitat (COLD).
42. The Los Angeles River Watershed Trash TMDL identifies discharges from the municipal separate storm sewer system as the principal source of trash to the Los Angeles River and its tributaries. As such, WLAs were assigned to MS4 Permittees that discharge to the MS4 in the watershed. The WLAs are expressed as progressively decreasing allowable amounts of trash discharges from jurisdictional areas within the watershed. The Trash TMDL requires MS4 Permittees to make annual reductions of their discharges of trash to the Los Angeles River Watershed over a 9-year period, until the numeric target of zero trash discharged from the MS4 is achieved for the 2013-2014 storm year. The Basin Plan assigns MS4 Permittees within the Los Angeles River Watershed baseline Waste Load Allocations from which annual reductions are to be made. (See Basin Plan, Table 7-2.2.) The Basin Plan also specifies interim and final Waste Load Allocations as decreasing percentages of the Table 7-2.2 baseline

WLAs, and specifies the corresponding “Compliance Points”. (See Basin Plan, Table 7-2.3.)

43. The Los Angeles River Watershed Trash TMDL specifies that the WLAs shall be implemented through MS4 permits. Federal regulations require that NPDES permits be consistent with the assumptions and requirements of any available waste load allocation. (40 CFR 122.44(d)(1)(vii)(B).) State law requires both that the Regional Board implement its Basin Plan when adopting waste discharge requirements (WDRs) and that NPDES permits apply “any more stringent effluent standards or limitations necessary to implement water quality control plans...” (Wat. Code §§ 13263, 13377).
44. The Ninth Circuit Court of Appeals in *Defenders of Wildlife v. Browner* ruled that the Clean Water Act grants the permitting agency discretion either to require “strict compliance” with water quality standards through the imposition of numeric effluent limitations, or to employ an iterative approach toward compliance with water quality standards, by requiring improved BMPs over time (*Defenders of Wildlife v. Browner* (9th Cir. 1999) 191 F.3d 1159). In a precedential decision, the State Board acknowledged that the holding in *Browner* allows the issuance of MS4 permits that limit their provisions to BMPs that control pollutants to the MEP, and which do not require compliance with water quality standards. However, the Water Boards have declined to adopt that approach in light of the impacts of discharges from MS4s on waters throughout the State and Los Angeles region (see Order WQ 2001-15 and Part 2 of the LA County MS4 Permit). The State Board concluded and the Regional Board agrees that “where urban runoff is causing or contributing to exceedances of water quality standards, it is appropriate to require improvements to BMPs that address those exceedances” (Order WQ 2001-15, p. 8).
45. In a recent decision, the State Board also concluded that incorporation of the provisions of TMDLs into MS4 permits requires extra consideration. Specifically, the State Board held: “TMDLs, which take significant resources to develop and finalize, are devised with specific implementation plans and compliance dates designed to bring impaired waters into compliance with water quality standards. It is our intent that federally mandated TMDLs be given substantive effect. Doing so can improve the efficacy of California’s NPDES storm water permits.” The State Board stated that TMDLs should not be an “academic exercise”, and indicated that in some instances when implementing TMDLs, numeric effluent limitations may be an appropriate means of controlling pollutants in storm water, provided the Regional Board’s determination is adequately supported in the permit findings (Order WQ 2009-0008). The following paragraphs support the Regional Board’s determination to implement the Trash TMDL with numeric effluent limitations.
46. The Trash TMDL specified a specific formula for calculating and allocating annual reductions in trash discharges from each jurisdiction.

The formula results in specified annual amounts of trash that may be discharged from each jurisdiction into the receiving waters. Translation of the compliance points described in the TMDL into jurisdiction-specific load reductions from the baseline levels, as specified in the TMDL, logically results in the articulation of an annual limit on the amount of a pollutant that may be discharged. The specification of allowable annual trash discharge amounts meets the definition of an “effluent limitation”, as that term is defined in subdivision (c) of section 13385.1 of the California Water Code. Specifically, the trash discharge limitations constitute a “numeric restriction ... on the quantity [or] discharge rate ... of a pollutant or pollutants that may be discharged from an authorized location.” While there may be other ways to incorporate the compliance points from the TMDL into permit conditions, the Regional Board is not aware of any other mechanisms that would result in actual compliance with the requirements of the TMDL as it was intended.

47. The process to establish the Trash TMDL was exceedingly lengthy, heavily litigated and scrutinized, and contained extensive analysis. The essence of this TMDL has been twice adopted by the Regional Board, and approved by the State Board, OAL, and the US EPA, and has been subject to considerable judicial review. Therefore, the assumptions underlying this TMDL have been thoroughly vetted by staff, stakeholders, other agencies, and the courts over a significant period of time.
48. In its resolution establishing the Trash TMDL, the Regional Board already determined that the implementation schedule was reasonable and feasible, and noted that the MS4 Permittees had notice of the trash impairment since at least 1998 (with its listing on the 1998 303(d) list) and had been required to attain water quality standards for trash in the receiving waters since this order was first adopted in December of 2001. (See e.g., Resolution R07-012, finding 14.) The Court of Appeal affirmed the Regional Board’s determination that the final waste load allocations were attainable and not inordinately expensive. (*Cities of Arcadia*, 135 Cal.App.4th at 1413 and 1427-1430.) Full capture systems, partial capture devices, and institutional controls are presently available to feasibly and practicably attain the interim and final effluent limitations, and it is anticipated that this order will precipitate additional innovations in control strategies and technologies, just as the adoption of the Trash TMDL resulted in the proffering and certification of seven full capture systems.
49. The Trash TMDL and this order include provisions that allow Permittees to be deemed in compliance with their effluent limitations through the installation of certain best management practices (certified full capture systems). Any Permittee that is deemed in compliance through the use of certified full capture systems would not be in violation of the effluent limitations even if some trash is discharged in excess of the annual limitations.
50. The Trash TMDL includes provisions requiring its reconsideration after a trash reduction of 50% has been achieved and sustained in the

watershed, which provides an opportunity to reexamine some of the assumptions of the TMDL after tangible and meaningful progress has been made in the watershed. (See Basin Plan, Table 7-2.3, fn. 2.) Should this reconsideration result in a modification to the final waste load allocations, the permit will be reopened pursuant to Part 6., paragraph I.1.b, to ensure the effluent limitations contained in Tables 1a and 1b of Appendix 7-1 are consistent with the assumptions and requirements of any revised waste load allocations. (40 CFR § 122.44(d)(1)(vii)(B).)

51. Depending upon the compliance strategy selected by each Permittee, compliance with the effluent limitations set forth in Appendix 7-1 may require a demonstration that the Permittee is in strict compliance with water quality standards. It remains the Permittee's choice, however, to comply via certified full capture systems (which do not require a demonstration of strict compliance with water quality standards), or partial capture devices and/or institutional controls.
52. Section 402(p)(3)(B)(iii) of the Clean Water Act, requires MS4 Permittees to reduce the pollutants in their storm water discharges to the "maximum extent practicable" (MEP). As set forth herein, "practicable" options presently exist to achieve compliance with the effluent limitations. Since the effluent limitations can be practicably achieved, their imposition is within the federally mandated MEP standard, and no analysis contemplated by *City of Burbank v. SWRCB* (2005) 35 Cal.4th 613 pursuant to Water Code section 13241 is necessary to support these effluent limitations.
53. In its discretion, the Regional Board may administratively impose civil liability of up to \$10,000 for "each day in which the violation [of waste discharge requirements] occurs." (Wat. C. § 13385, subd (c).) Not every storm event may result in trash discharges. The Los Angeles River Trash TMDL adopted by the Regional Board states that improperly deposited trash is mobilized during storm events of greater than 0.25 inches of precipitation. Therefore, violations of the effluent limitations are limited to the days of a storm event of greater than 0.25 inches. Once a Permittee has violated the annual effluent limitation, any subsequent discharges of trash during any day of a storm event of greater than 0.25 inches during the same storm year constitutes an additional "day in which the violation [of the effluent limitation] occurs".
54. Unlike subdivision (c) of Water Code section 13385 where violations of effluent limitations are assessed on a per day basis, the mandatory minimum penalties subdivisions (Wat. Code § 13385, subd. (h) and (i)) require the Regional Board to assess mandatory minimum penalties for "each violation" of an effluent limitation. The effluent limitations in Appendix 7-1 are expressed as annual limitations. Therefore, there can be no more than one violation of each interim or final effluent limitation per year. Trash is considered a Group I pollutant, as specified in Appendix A to section 123.45 of Title 40 of the Code of Federal Regulations. Therefore, each annual violation of an effluent limitation in

Appendix 7-1 by forty percent or more would be considered a “serious violation” under subdivision (h). With respect to the final effluent limitation of zero trash, any detectable discharge of trash necessarily is a serious violation, in accordance with the State Board’s Enforcement Policy. Violations of the effluent limitations in Appendix 7-1 would not constitute “chronic” violations that would give rise to mandatory liability under subdivision (i) because four or more violations of the effluent limitations subject to a mandatory penalty cannot occur in a period of six consecutive months.

55. Therefore, the modifications to the Order include effluent limitations in a manner consistent with the assumptions and requirements of the WLAs from which they are derived as well as an allowance to comply with these effluent limitations [*i.e.* WLAs] through proper installation and maintenance of certified full capture systems.
56. Modifications consistent with the assumptions and requirements of the TMDL are therefore included in Parts 4 (Special Provisions) and 5 (Definitions) of this Order. Part 7 (Total Maximum Daily Load Provisions) is added to this Order and incorporates provisions to assure that Los Angeles County MS4 Permittees achieve the Waste Load Allocations (WLAs) and comply with other requirements of Total Maximum Daily Loads (TMDLs) covering impaired waters impacted by the Permittees’ discharges. These modifications are made pursuant to 40 CFR sections 122.41(f), 122.44.(d)(1)(vii)(B), and 122.62, and Part 6.1.1 of this Order. Tables 7-2.1, 7-2.2, and 7-2.3 of the Basin Plan set forth the pertinent provisions of the Los Angeles River Watershed Trash TMDL. The interim and final effluent limitations consistent with the assumptions and requirements of the waste load allocations, and related provisions required of Permittees within the watershed are provided in Part 7 of this Order.
57. Permittees identified as responsible agencies in the Trash TMDL may achieve compliance with interim and final effluent limitations through progressive installation of BMPs meeting the definition of “full capture” throughout their jurisdictions’ drainage areas. Alternatively, Permittees may install “partial capture” devices and/or implement institutional controls to meet their respective interim and final effluent limitations. Where partial capture devices are utilized as the sole trash control measure, the degree of compliance may be demonstrated based upon performance data specific to the jurisdictional area. However, compliance with the final effluent limitation cannot be achieved through the exclusive use of partial capture devices. Where a combination of partial capture devices and institutional controls are used, compliance shall be determined based on the approximation of jurisdiction-specific trash discharges.
58. The Executive Officer will develop a standard reporting form, consistent with these provisions, which shall be used by Permittees to report compliance with the effluent limitations on an annual basis.

60. Pursuant to federal regulations at 40 CFR sections 124.8 and 125.56, a Fact Sheet was prepared to provide the basis for incorporating the Los Angeles River Watershed Trash TMDL into this Order. This Fact Sheet is hereby incorporated by reference into these findings.

F. Implementation

1. The California Environmental Quality Act (CEQA) (Cal. Pub. Resources Code § 21000 *et seq.*) requires that public agencies consider the environmental impacts of the projects they approve for development. CEQA applies to projects that are considered discretionary and does not apply to ministerial projects, which involve the use of established standards or objective measurements. A ministerial project may be made discretionary by adopting local ordinance provisions or imposing conditions to create decision-making discretion in approving the project. In the alternative, Permittees may establish standards and objective criteria administratively for storm water mitigation for ministerial projects. For water quality purposes, the Regional Board considers that all new development and significant redevelopment activity in specified categories, that receive approval or permits from a municipality, are subject to storm water mitigation requirements.
2. The objective of this Order is to protect the beneficial uses of receiving waters in Los Angeles County. To meet this objective, this Order requires that the SQMP specify BMPs that will be implemented to reduce the discharge of pollutants in storm water to the maximum extent practicable. Further, Permittees are to assure that storm water discharges from the MS4 shall neither cause nor contribute to the exceedance of water quality standards and objectives nor create conditions of nuisance in the receiving waters, and that the discharge of non-storm water to the MS4 has been effectively prohibited.
3. The SQMP required in this Order builds upon the programs established in Order Nos. 90-079, and 96-054, consists of the components recommended in the USEPA guidance manual, and was developed with the cooperation of representatives from the regulated community and environmental groups. The SQMP includes provisions that promote customized initiatives, both on a countywide and watershed basis, in developing and implementing cost-effective measures to minimize discharge of pollutants to the receiving water. The various components of the SQMP, taken as a whole rather than individually, are expected to reduce pollutants in storm water and urban runoff to the maximum extent practicable. Provisions of the SQMP are fully enforceable under provisions of this Order.
4. The emphasis of the SQMP is pollution prevention through education, public outreach, planning, and implementation as source control BMPs first and then Structural and Treatment Control BMPs next. Successful implementation of the provisions of the SQMP will require cooperation

and coordination of all public agencies in each Permittee's organization, among Permittees, and with the regulated community.

5. The implementation of a Public Information and Participation Program is a critical component of a storm water management program. An informed and knowledgeable community is critical to the success of a storm water management program since it helps insure the following: (i) greater support for the program as the public gains a greater understanding of the reasons why it is necessary and important, and (ii) greater compliance with the program as the public becomes aware of the personal responsibilities expected of them and others in the community, including the individual actions they can take to protect or improve the quality of area waters.
6. This Order includes a Monitoring Program that incorporates Minimum Levels (MLs) established under the SIP. The SIP's MLs represent the lowest quantifiable concentration for priority toxic pollutants that is measurable with the use of proper method-based analytical procedures and factoring out matrix interference. The SIP's MLs therefore represent the best available science for determining MLs and are appropriate for a storm water monitoring program. The use of MLs allows the detection of toxic priority pollutants at concentrations of concern using recent advances in chemical analytical methods.
7. This Order provides flexibility for Permittees to petition the Regional Board Executive Officer to substitute a BMP under the SQMP with an alternative BMP, if they can provide information and documentation on the effectiveness of the alternative, equal to or greater than the prescribed BMP in meeting the objectives of this Order.
8. This Order contemplates that the Permittees are responsible for considering potential storm water impacts when making planning decisions in order to fulfill the Permittees' CWA requirement to reduce the discharge of pollutants in municipal storm water to the MEP from new development and redevelopment activities. However, the Permittees retain authority to make the final land-use decisions and retain full statutory authority for deciding what land uses are appropriate at specific locations within each Permittee's jurisdiction. This Order and its requirements are not intended to restrict or control local land use decision-making authority.
9. This Order is not intended to prohibit the inspection for or abatement of vectors by the State Department of Health Services or local vector agencies in accordance with Cal. Health and Safety Code § 2270 *et seq.* and §116110 *et seq.* Certain Treatment Control BMPs if not properly designed, operated or maintained may create habitats for vectors (e.g. mosquito and rodents). This Order contemplates that the Permittees will closely cooperate and collaborate with local vector control agencies and the State Department of Health Services for the implementation, operation, and maintenance of Treatment Control BMPs in order to minimize the risk to public health from vector borne diseases.

G. Public Process

1. The Regional Board has notified the Permittees and interested agencies and persons of its intent to issue waste discharge requirements for this discharge, and has provided them with an opportunity to submit their written view and recommendations.
2. The Regional Board, in a public hearing, heard and considered all comments pertaining to the discharge and to the tentative requirements.
3. The Regional Board has conducted public workshops to discuss drafts of the permit. On April 24, 2001, Regional Board staff conducted a workshop outlining the reasoning behind the changes proposed for the new permit and received input from the Permittees and the public regarding those proposed changes. On July 26, 2001, a second public workshop was held at a special Regional Board meeting. The Permittees and the public had another opportunity to express their opinions regarding the proposed changes to the permit in front of the Regional Board members. A significant number of working meetings with the Permittees and other interested parties have occurred throughout the period from the submittal of the ROWD and completion of the tentative draft, in an attempt to incorporate and address all the comments presented.
4. The Los Angeles County Flood Control District, the County of Los Angeles and the other municipalities are co-permittees as defined in 40 CFR 122.26 (b)(1). Los Angeles County Flood Control District will coordinate with the other municipalities and facilitate program implementation. Each Permittee is responsible only for a discharge for which it is the operator.
5. This Order shall serve as a NPDES Permit, pursuant to CWA § 402, or amendments thereto, and shall take effect 50 days from Order adoption provided the Regional Administrator of the USEPA has no objections.
6. The action to adopt an NPDES permit is exempt from the provisions of Chapter 3 of CEQA (Cal. Pub. Resources Code § 21100 *et seq.*), in accordance with CWC § 13389.
7. Pursuant to CWC §13320, any aggrieved party may seek review of this Order by filing a petition with the State Board. A petition must be sent to: State Water Resources Control Board, P.O. Box 100, Sacramento, California, 95812, within 30 days of adoption of the Order by the Regional Board.
8. This Order may be modified or alternatively revoked or reissued prior to its expiration date, in accordance with the procedural requirements of the NPDES program, and the CWC for the issuance of waste discharge requirements.

IT IS HEREBY ORDERED that the Los Angeles County Flood Control District, Los Angeles County, and the Cities of Agoura Hills, Alhambra, Arcadia, Artesia, Azusa, Baldwin Park, Bell,

Amended by Orders R4-2006-0074, R4-2007-0042, and R4-2009-0130, and further amended pursuant to L.A. Superior Court Case No. BS122724

Bellflower, Bell Gardens, Beverly Hills, Bradbury, Burbank, Calabasas, Carson, Cerritos, Claremont, Commerce, Compton, Covina, Cudahy, Culver City, Diamond Bar, Downey, Duarte, El Monte, El Segundo, Gardena, Glendale, Glendora, Hawaiian Gardens, Hawthorne, Hermosa Beach, Hidden Hills, Huntington Park, Industry, Inglewood, Irwindale, La Cañada Flintridge, La Habra Heights, Lakewood, La Mirada, La Puente, La Verne, Lawndale, Lomita, Los Angeles, Lynwood, Malibu, Manhattan Beach, Maywood, Monrovia, Montebello, Monterey Park, Norwalk, Palos Verdes Estates, Paramount, Pasadena, Pico Rivera, Pomona, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, Rosemead, San Dimas, San Fernando, San Gabriel, San Marino, Santa Clarita, Santa Fe Springs, Santa Monica, Sierra Madre, Signal Hill, South El Monte, South Gate, South Pasadena, Temple City, Torrance, Vernon, Walnut, West Covina, West Hollywood, Westlake Village, and Whittier, in order to meet the provisions contained in Division 7 of the CWC and regulations adopted thereunder, and the provisions of the CWA, as amended, and regulations and guidelines adopted thereunder, shall comply with the following:

Part 1. DISCHARGE PROHIBITIONS

- Part 1. A. The Permittees shall effectively prohibit non-storm water discharges into the MS4 and watercourses, except where such discharges:
1. Are covered by a separate individual or general NPDES permit for non-storm water discharges; or
 2. Fall within one of the categories below, and meet all conditions when specified by the Regional Board Executive Officer:
 - a) Category A - Natural flow:
 - (1) Natural springs and rising ground water;
 - (2) Flows from riparian habitats or wetlands;
 - (3) Stream diversions, permitted by the State Board; and
 - (4) Uncontaminated ground water infiltration [as defined by 40 CFR 35.2005(20)].
 - b) Category B - Flows from emergency fire fighting activity.
 - c) Category C - Flows incidental to urban activities:
 - (1) Reclaimed and potable landscape irrigation runoff;
 - (2) Potable drinking water supply and distribution system releases (consistent with American Water Works Association guidelines for dechlorination and suspended solids reduction practices);
 - (3) Drains for foundations, footings, and crawl spaces;
 - (4) Air conditioning condensate;

- (5) Dechlorinated/debrominated swimming pool discharges;
- (6) Dewatering of lakes and decorative fountains;
- (7) Non-commercial car washing by residents or by non-profit organizations; and
- (8) Sidewalk rinsing.

The Regional Board Executive Officer may add or remove categories of non-storm water discharges above. Furthermore, in the event that any of the above categories of non-storm water discharges are determined to be a source of pollutants by the Regional Board Executive Officer, the discharge will no longer be exempt from this prohibition unless the Permittee implements conditions approved by the Regional Board Executive Officer to ensure that the discharge is not a source of pollutants. Notwithstanding the above, the Regional Board Executive Officer may impose additional prohibitions of non-storm water discharges in consideration of antidegradation policies and TMDLs.

Part 1. B. [Intentionally left blank]^{3,4}

Part 2. RECEIVING WATER LIMITATIONS

1. Discharges from the MS4 that cause or contribute to the violation of Water Quality Standards or water quality objectives are prohibited.
2. Discharges from the MS4 of storm water, or non-storm water, for which a Permittee is responsible for, shall not cause or contribute to a condition of nuisance.
3. The Permittees shall comply with Part 2.1. and 2.2. through timely implementation of control measures and other actions to reduce pollutants in the discharges in accordance with the SQMP and its components and other requirements of this Order including any modifications. The SQMP and its components shall be designed to achieve compliance with receiving water limitations. If exceedances of Water Quality Objectives or Water Quality Standards (collectively, Water Quality Standards) persist, notwithstanding implementation of the SQMP and its components and other requirements of this permit, the Permittee shall assure compliance with discharge prohibitions and receiving water limitations by complying with the following procedure:
 - a) Upon a determination by either the Permittee or the Regional Board that discharges are causing or contributing to an exceedance of an applicable Water Quality Standard, the Permittee shall promptly notify and thereafter submit a Receiving Water Limitations (RWL) Compliance Report (as

³ [Intentionally left blank]

⁴ [Intentionally left blank]

described in the Program Reporting Requirements, Section I of the Monitoring and Reporting Program) to the Regional Board that describes BMPs that are currently being implemented and additional BMPs that will be implemented to prevent or reduce any pollutants that are causing or contributing to the exceedances of Water Quality Standards. This RWL Compliance Report may be incorporated in the annual Storm Water Report and Assessment unless the Regional Board directs an earlier submittal. The RWL Compliance Report shall include an implementation schedule. The Regional Board may require modifications to the RWL Compliance Report.

- b) Submit any modifications to the RWL Compliance Report required by the Regional Board within 30 days of notification.
 - c) Within 30 days following the approval of the RWL Compliance Report, the Permittee shall revise the SQMP and its components and monitoring program to incorporate the approved modified BMPs that have been and will be implemented, an implementation schedule, and any additional monitoring required.
 - d) Implement the revised SQMP and its components and monitoring program according to the approved schedule.
4. So long as the Permittee has complied with the procedures set forth above and is implementing the revised SQMP and its components, the Permittee does not have to repeat the same procedure for continuing or recurring exceedances of the same receiving water limitations unless directed by the Regional Board to develop additional BMPs.
 5. [Intentionally left blank]⁵
 6. During Summer Dry Weather there shall be no discharges of bacteria from MS4s into Marina del Rey Harbor Basins D, E, or F, including Mothers' Beach that cause or contribute to exceedances of the applicable bacteria objectives. The applicable bacteria objectives include both the single sample and geometric mean bacteria objectives set to protect the Water Contact Recreation (REC-1) beneficial use, as set forth in the Basin Plan.⁶

⁵ [Intentionally left blank]

⁶ Samples collected for determining compliance with the receiving water limitations of Part 2.6 shall be processed in accordance with the sampling procedures and analytical methodology set forth in the *Marina del Rey Harbor Mothers' Beach and Back Basins Bacterial TMDL Coordinated Shoreline Monitoring Plan* dated April 13, 2007 and the Monitoring and Reporting Program CI 6948.

Part 3. STORM WATER QUALITY MANAGEMENT PROGRAM (SQMP) IMPLEMENTATION

A. General Requirements

1. Each Permittee shall, at a minimum, implement the SQMP. The SQMP is an enforceable element of this Order. The SQMP shall be implemented no later than February 1, 2002, unless a later date has been specified for a particular provision in this Order.
2. The SQMP shall, at a minimum, comply with the applicable storm water program requirements of 40 CFR 122.26(d)(2). The SQMP and its components shall be implemented so as to reduce the discharges of pollutants in storm water to the MEP.
3. Each Permittee shall implement additional controls, where necessary, to reduce the discharges of pollutants in storm water to the MEP.
4. Permittees that modify the countywide SQMP (i.e., implement additional controls, implement different controls than described in the countywide SQMP, or determine that certain BMPs in the countywide SQMP are not applicable in the area under its jurisdiction), shall develop a local SQMP, no later than August 1, 2002. The local SQMP shall be customized to reflect the conditions in the area under the Permittee's jurisdiction and shall specify activities being implemented under the appropriate elements described in the countywide SQMP.

B. Best Management Practice Implementation

The Permittees shall implement or require the implementation of the most effective combination of BMPs for storm water/urban runoff pollution control. When implemented, BMPs are intended to result in the reduction of pollutants in storm water to the MEP.

C. Revision of the Storm Water Quality Management Program

The Permittees shall revise the SQMP, at the direction of the Regional Board Executive Officer, to incorporate program implementation amendments so as to comply with regional, watershed specific requirements, and/or waste load allocations developed and approved pursuant to the process for the designation and implementation of Total Maximum Daily Loads (TMDLs) for impaired water bodies.

D. Designation and Responsibilities of the Principal Permittee

The Los Angeles County Flood Control District is hereby designated as the Principal Permittee. As such, the Principal Permittee shall:

1. Coordinate and facilitate activities necessary to comply with the requirements of this Order, but is not responsible for ensuring compliance of any individual Permittee;

2. Coordinate permit activities among Permittees and act as liaison between Permittees and the Regional Board on permitting issues;
3. Provide personnel and fiscal resources for the necessary updates of the SQMP and its components;
4. Provide technical and administrative support for committees that will be organized to implement the SQMP and its components;
5. Convene the Watershed Management Committees (WMCs) constituted pursuant to Part F, below, upon designation of representatives;
6. Implement the Countywide Monitoring Program required under this Order and evaluate, assess and synthesize the results of the monitoring program;
7. Provide personnel and fiscal resources for the collection, processing and submittal to the Regional Board of annual reports and summaries of other reports required under the SQMP; and
8. Comply with the "Responsibilities of the Permittees" in Part 3.E., below.

E. Responsibilities of the Permittees

Each Permittee is required to comply with the requirements of this Order applicable to discharges within its boundaries (see Findings D.1, D.2. and D.3.) and not for the implementation of the provisions applicable to the Principal Permittee or other Permittees. Each Permittee shall, within its geographic jurisdiction:

1. Comply with the requirements of the SQMP and any modifications thereto;
2. Coordinate among its internal departments and agencies, as appropriate, to facilitate the implementation of the requirements of the SQMP applicable to such Permittee in an efficient and cost-effective manner;
3. Designate a technically knowledgeable representative to the appropriate WMC;
4. Participate in intra-agency coordination (e.g. Fire Department, Building and Safety, Code Enforcement, Public Health, etc.) necessary to successfully implement the provisions of this Order and the SQMP.
5. Prepare an annual Budget Summary of expenditures applied to the storm water management program. This summary shall identify the storm water budget for the following year, using estimated percentages and written explanations where necessary, for the specific categories noted below:
 - a) Program management
 - Administrative costs
 - b) Program Implementation

Where information is available, provide an estimated percent breakdown of expenditures for the categories below:

- Illicit connection/illicit discharge
 - Development planning
 - Development construction
 - Construction inspection activities
 - Industrial/Commercial inspection activities
 - Public Agency Activities
 - Maintenance of Structural BMPs and Treatment Control BMPs
 - Municipal Street Sweeping
 - Catch basin clean-up
 - Trash collection
 - Capital costs
- c) Public Information and Participation
- d) Monitoring Program
- e) Miscellaneous Expenditures
6. Each Permittee, in addition to the Budget Summary, shall report any supplemental dedicated budgets for the same categories.

F. Watershed Management Committees (WMCs)

1. Each WMC shall be comprised of a voting representative from each Permittee in the WMA.
2. The WMC's chair and secretary shall be chosen by the WMC upon Order adoption and on an annual basis, thereafter. In the absence of volunteer Permittee(s) for the positions, the Principal Permittee shall assume those roles until the WMC chooses members of the committee for the positions.
3. Each WMC shall:
 - a) Facilitate cooperation and exchange of information among Permittees;
 - b) Establish additional goals and objectives and associated deadlines for the WMA, as the program implementation progresses;
 - c) Prioritize pollution control efforts based on beneficial use impairment(s), watershed characteristics and analysis of results from studies and the monitoring program;
 - d) Develop and/or update and monitor the adequate implementation, on an annual basis, of the tasks identified for the WMA;
 - e) Assess the effectiveness of, prepare revisions for, and recommend appropriate changes to the SQMP and its components;

- f) Continue to prioritize the Industrial/Commercial critical sources for investigation, outreach and follow-up; and
- g) Meet four times per year and, as necessary.

G. Legal Authority

1. Permittees shall possess the necessary legal authority to prohibit non-storm water discharges to the storm drain system, including, but not limited to:
 - a) Illicit discharges and illicit connections and require removal of illicit connections;
 - b) The discharge of wash waters to the MS4 from the cleaning of gas stations, auto repair garages, or other types of automotive service facilities;
 - c) The discharge of runoff to the MS4 from mobile auto washing, steam cleaning, mobile carpet cleaning, and other such mobile commercial and industrial operations;
 - d) The discharge of runoff to the MS4 from areas where repair of machinery and equipment which are visibly leaking oil, fluid or antifreeze, is undertaken;
 - e) The discharge of runoff to the MS4 from storage areas of materials containing grease, oil, or other hazardous substances, and uncovered receptacles containing hazardous materials;
 - f) The discharge of chlorinated/ brominated swimming pool water and filter backwash to the MS4;
 - g) The discharge of runoff from the washing of toxic materials from paved or unpaved areas to the MS4;
 - h) Washing impervious surfaces in industrial/commercial areas that results in a discharge of runoff to the MS4;
 - i) The discharge of concrete or cement laden wash water from concrete trucks, pumps, tools, and equipment to the MS4; and
 - j) Dumping or disposal of materials into the MS4 other than storm water, such as:
 - (1) Litter, landscape debris and construction debris;
 - (2) Any state or federally banned or unregistered pesticides;
 - (3) Food and food processing wastes; and
 - (4) Fuel and chemical wastes, animal wastes, garbage, batteries, and other materials that have potential adverse impacts on water quality.

2. The Permittees shall possess adequate legal authority to:
 - a) Require persons within their jurisdiction to comply with conditions in Permittees' ordinances, permits, contracts, model programs, or orders (i.e. hold dischargers to its MS4 accountable for their contributions of pollutants and flows);
 - b) Utilize enforcement mechanisms to require compliance with Permittees ordinances, permits, contracts, or orders;
 - c) Control pollutants, including potential contribution, in discharges of storm water runoff associated with industrial activities (including construction activities) to its MS4 and control the quality of storm water runoff from industrial sites (including construction sites). This requirement applies to Source Control, and Treatment Control BMPs;
 - d) Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and non-compliance with permit conditions, including the prohibition of illicit discharges to the MS4. Permittees must possess authority to enter, sample, inspect, review and copy records, and require regular reports from industrial facilities (including construction sites) discharging polluted or with the potential to discharge polluted storm water runoff into its MS4;
 - e) Require the use of BMPs to prevent or reduce the discharge of pollutants to MS4s to MEP; and
 - f) Require that Treatment Control BMPs be properly operated and maintained to prevent the breeding of vectors.
3. Each Permittee shall, no later than November 1, 2002, amend and adopt (if necessary), a Permittee-specific storm water and urban runoff ordinance to enforce all requirements of this permit.
4. Each Permittee shall submit no later than December 2, 2002, a new or updated statement by its legal counsel that the Permittee has obtained all necessary legal authority to comply with this Order through adoption of ordinances and/or municipal code modifications.

Part 4. SPECIAL PROVISIONS

Maximum Extent Practicable Standard

This permit, and the provisions herein, are intended to develop, achieve, and implement a timely, comprehensive, cost-effective storm water pollution control program to reduce the discharge of pollutants in storm water to the MEP from the permitted areas in the County of Los Angeles to the waters of the State.

A. General Requirements

1. Best Management Practice Substitution

The Regional Board Executive Officer may approve any site-specific BMP substitution upon petition by a Permittee(s), if the Permittee can document that:

- a) The proposed alternative BMP or program will meet or exceed the objective of the original BMP or program in the reduction of storm water pollutants; or
- b) The fiscal burden of the original BMP or program is substantially greater than the proposed alternative and does not achieve a substantially greater improvement in storm water quality; and,
- c) The proposed alternative BMP or program will be implemented within a similar period of time.

B. Public Information and Participation Program (PIPP)

The Principal Permittee shall implement a Public Information and Participation Program (PIPP) that includes, but is not limited to, the requirements listed in this section. The Principal Permittee shall be responsible for developing and implementing the Public Education Program, as described in the SQMP, and shall coordinate with Permittees to implement specific requirements.

The objectives of the PIPP are as follows:

- To measurably increase the knowledge of the target audiences regarding the MS4, the impacts of storm water pollution on receiving waters, and potential solutions to mitigate the problems caused;
- To measurably change the waste disposal and runoff pollution generation behavior of target audiences by encouraging implementation of appropriate solutions; and
- To involve and engage socio-economic groups and ethnic communities in Los Angeles County to participate in mitigating the impacts of storm water pollution.

The Principal Permittee shall convene an advisory committee to provide input and assistance in meeting the goals and objectives of the public education campaign. The advisory committee shall be consulted during the process of developing the PIPP campaign, and shall provide comments and advice during the process of preparing a Request For Proposals for a storm water public education contractor. The committee may participate as a part of a working group that evaluates contractor proposals and other tasks as appropriate. The committee shall be comprised of representatives of the environmental community, Permittee cities, Regional Board staff, and experts in the fields of public education and marketing. The Principal Permittee shall ensure that the committee meets at least once a year.

1. Residential Program

a) "No Dumping" Message

Each Permittee shall mark all storm drain inlets that they own with a legible "no dumping" message. In addition, signs with prohibitive language discouraging illegal dumping must be posted at designated public access points to creeks, other relevant water bodies, and channels no later than February 2, 2004. Signage and storm drain messages shall be legible and maintained as necessary during the term of the permit.

b) Countywide Hotline

The 888-CLEAN-LA hotline will serve as the general public reporting contact for reporting clogged catch basin inlets and illicit discharges/dumping, faded or lack of catch basin stencils, and general storm water management information. Each Permittee may establish its own hotline if preferred. Permittees shall include this information, updated when necessary, in public information, and the government pages of the telephone book, as they are developed or published. The Principal Permittee shall compile a list of the general public reporting contacts from all Permittees and make this information available on the web site (888CleanLA.com) and upon request. Permittees shall provide the Principal Permittee with their reporting contacts no later than March 1, 2002. Permittees are responsible for providing current, updated information to the Principal Permittee.

c) Outreach and Education

(1) The Principal Permittee shall continue to implement the following activities that were components of the first five-year PIPP:

- (i) Advertising;
- (ii) Media relations;
- (iii) Public service announcements;
- (iv) "How To" instructional material distributed in a targeted and activity-related manner;
- (v) Corporate, community association, environmental organization and entertainment industry tie-ins; and
- (vi) Events targeted to specific activities and population subgroups.

(2) The Principal Permittee shall develop a strategy to educate ethnic communities and businesses through culturally effective methods. Details of this strategy should be incorporated into the Public Education Program, and implemented, no later than February 3, 2003.

- (3) The Principal Permittee shall enhance the existing outreach efforts to residents and businesses related to the proper disposal of cigarette butts.
- (4) Each Permittee shall conduct educational activities within its jurisdiction and participate in countywide events.
- (5) The Principal Permittee shall organize Public Outreach Strategy meetings for Permittees on a quarterly basis, beginning no later than May 1, 2002. The Principal Permittee shall provide guidance for Permittees to augment the countywide outreach and education program. Permittees shall coordinate regional and local outreach and education to reduce duplication of efforts. Permittees are encouraged to include other interested parties in the outreach strategy to strengthen and coordinate educational efforts.
- (6) The Principal Permittee shall ensure that a minimum of 35 million impressions per year are made on the general public about storm water quality via print, local TV access, local radio, or other appropriate media.
- (7) The Principal Permittee, in cooperation with the Permittees, shall provide schools within each School District in the County with materials, including, but not limited to, videos, live presentations, and other information necessary to educate a minimum of 50 percent of all school children (K-12) every 2 years on storm water pollution.
- (8) Permittees shall provide the contact information for their appropriate staff responsible for storm water public education activities to the Principal Permittee no later than April 1, 2002, and changes to contact information no later than 30 days after a change occurs.
- (9) The Principal Permittee shall develop a strategy to measure the effectiveness of in-school educational programs. The protocol shall include assessment of students' knowledge of storm water pollution problems and solutions before and after educational efforts are conducted. The protocol shall be developed and submitted to the Regional Board Executive Officer for approval no later than May 1, 2002. It shall be implemented upon approval.
- (10) In order to ensure that the PIPP is demonstrably effective in changing the behavior of the public, the Principal Permittee shall develop a behavioral change assessment strategy no later than May 1, 2002. The strategy shall be developed based on sociological data and studies (such

as the County Segmentation Study). The Principal Permittee shall submit the assessment strategy to the Regional Board Executive Office for approval. It shall be implemented on approval.

d) Pollutant-Specific Outreach

The Principal Permittee, in cooperation with Permittees, shall coordinate to develop outreach programs that focus on the watershed-specific pollutants listed in Table 1 no later than February 3, 2003. Metals may be appropriately addressed through the Industrial/Commercial Facilities Program (e.g. distribute education materials on appropriate BMPs for metal waste management to facilities that have been identified as a potential source, such as metal fabricating facilities). Region-wide pollutants may be included in the Principal Permittee's mass media outreach efforts.

Table 1.	
Watershed	Target Pollutants for Outreach
Ballona Creek	Trash, Indicator Bacteria, Metals, PAHs
Malibu Creek	Trash, Nutrients (Nitrogen), Indicator Bacteria, Sediments
Los Angeles River	Trash, Nutrients (Nitrogen), Indicator Bacteria, Metals, Pesticides, PAHs
San Gabriel River	Trash, Nutrients (Nitrogen), Indicator Bacteria, Metals
Santa Clara River	Nutrients (Nitrogen), Coliform
Dominguez Channel	Trash, Indicator Bacteria, PAHs

Each Permittee shall make outreach materials available to the general public and target audiences, such as schools, community groups, contractors and developers, and at appropriate public counters and events. Outreach material shall include information on pollutants, sources of concern, and source abatement measures.

2. Businesses Program

a) Corporate Outreach

The Principal Permittee shall develop and implement a Corporate Outreach program to educate and inform corporate managers about storm water regulations. The program shall target RGOs and restaurant chains. At a minimum, this program shall include:

- (1) Conferring with corporate management to explain storm water regulations;
- (2) Distribution and discussion of educational material regarding storm water pollution and BMPs, and provide

managers with suggestions to facilitate employee compliance with storm water regulations.

Corporate Outreach for all RGOs and restaurant chain corporations shall be conducted not less than twice during the permit term, with the first outreach contact to begin no later than February 3, 2003.

b) **Business Assistance Program**

The Principal Permittee and Permittees may implement a Business Assistance Program to provide technical resource assistance to small businesses to advise them on BMPs implementation to reduce the discharge of pollutants in storm water runoff. Programs may include:

- (1) On-site technical assistance or consultation via telephone to identify and implement storm water pollution prevention methods and best management practices; and
- (2) Making available, distributing, and discussing of applicable BMP and educational materials.

C. Industrial/Commercial Facilities Control Program

Each Permittee shall require implementation of pollutant reduction and control measures at industrial and commercial facilities, with the objective of reducing pollutants in storm water runoff. Except as specified in other sections of this Order, pollutant reduction and control measures can be used alone or in combination, and can include Structural and Source Control BMPs, and operation and maintenance procedures, which can be applied before, during, and/or after pollution generating activities. At a minimum, the Industrial/Commercial Facilities Control Program shall include requirements to: (1) track, (2) inspect, and (3) ensure compliance at industrial and commercial facilities that are critical sources of pollutants in storm water.

1. Track Critical Sources

- a) Each Permittee shall maintain a watershed-based inventory or database of all facilities within its jurisdiction that are critical sources of storm water pollution. Critical sources to be tracked are summarized below, and also specified in Attachment B:
 - (1) Commercial Facilities
 - restaurants;
 - automotive service facilities; and
 - RGOs and automotive dealerships.
 - (2) USEPA Phase I Facilities (Tier 1 and 2)
 - (3) Other Federally-mandated Facilities [as specified in 40 CFR 122.26(d)(2)(iv)(C)]

- municipal landfills;
 - hazardous waste treatment, disposal, and recovery facilities; and
 - facilities subject to SARA Title III (also known as EPCRA).
- b) Each Permittee shall include the following minimum fields of information for each industrial and commercial facility:
- name of facility and name of owner/operator;
 - address;
 - coverage under the GIASP or other individual or general NPDES permits; and
 - a narrative description including SIC codes that best reflects the industrial activities at and principal products of each facility.

The Regional Board encourages Permittees to add other fields of information, such as material usage and/or industrial output, and discrepancies between SIC Code designations (as reported by facility operators) and the actual type of industrial activity has the potential to pollute storm water. In addition, the Regional Board recommends use of an automated database system, such as a Geographical Information System (GIS) or Internet-based system; however, this is not required.

- c) Each Permittee shall update its inventory of critical sources at least annually. The update may be accomplished through collection of new information obtained through field activities or through other readily available intra-agency informational databases (e.g. business licenses, pretreatment permits, sanitary sewer hook-up permits).

2. Inspect Critical Sources

Each Permittee shall inspect all facilities in the categories and at a level and frequency as specified in the following subsections.

a) **Commercial Facilities**

(1) **Restaurants**

Frequency of Inspections: Twice during the 5-year term of the Order, provided that the first inspection occurs no later than August 1, 2004, and that there is a minimum interval of one year in between the first compliance inspection and the second compliance inspection.

Level of inspections: Each Permittee, in cooperation with its appropriate department (such as health or public works), shall inspect all restaurants within its jurisdiction to confirm that storm water BMPs are being effectively

implemented in compliance with State law, County and municipal ordinances, Regional Board Resolution 98-08, and the SQMP. At each restaurant, inspectors shall verify that the restaurant operator:

- has received educational materials on storm water pollution prevention practices;
- does not pour oil and grease or oil and grease residue onto a parking lot, street or adjacent catch basin;
- keeps the trash bin area clean and trash bin lids closed, and does not fill trash bins with washout water or any other liquid;
- does not allow illicit discharges, such as discharge of washwater from floormats, floors, porches, parking lots, alleys, sidewalks and street areas (in the immediate vicinity of the establishment), filters or garbage/trash containers;
- removes food waste, rubbish or other materials from parking lot areas in a sanitary manner that does not create a nuisance or discharge to the storm drain.

(2) Automotive Service Facilities

Frequency of Inspections: Twice during the 5-year term of the Order, provided that the first inspection occurs no later than August 1, 2004, and that there is a minimum interval of one year in between the first compliance inspection and the second compliance inspection.

Level of inspections: Each Permittee shall inspect all automotive service facilities within its jurisdiction to confirm that storm water BMPs are effectively implemented in compliance with County and municipal ordinances, Regional Board Resolution 98-08, and the SQMP. At each automotive service facility, inspectors shall verify that each operator:

- maintains the facility area so that it is clean and dry and without evidence of excessive staining;
- implements housekeeping BMPs to prevent spills and leaks;
- properly discharges wastewaters to a sanitary sewer and/or contains wastewaters for transfer to a legal point of disposal;
- is aware of the prohibition on discharge of non-storm water to the storm drain;
- properly manages raw and waste materials including proper disposal of hazardous waste;

- protects outdoor work and storage areas to prevent contact of pollutants with rainfall and runoff;
- labels, inspects, and routinely cleans storm drain inlets that are located on the facility's property; and
- trains employees to implement storm water pollution prevention practices.

(3) Retail Gasoline Outlets and Automotive Dealerships

Frequency of Inspection: Twice during the 5-year term of the Order, provided that the first inspection occurs no later than August 1, 2004, and that there is a minimum interval of one year in between the first compliance inspection and the second compliance inspection.

Level of Inspection: Each Permittee shall confirm that BMPs are being effectively implemented at each RGO and automotive dealership within its jurisdiction, in compliance with the SQMP, Regional Board Resolution 98-08, and the Stormwater Quality Task Force Best Management Practice Guide for RGOs. At each RGO and automotive dealership, inspectors shall verify that each operator:

- routinely sweeps fuel-dispensing areas for removal of litter and debris, and keeps rags and absorbents ready for use in case of leaks and spills;
- is aware that washdown of facility area to the storm drain is prohibited;
- is aware of design flaws (such as grading that doesn't prevent run-on, or inadequate roof covers and berms), and that equivalent BMPs are implemented;
- inspects and cleans storm drain inlets and catch basins within each facility's boundaries no later than October 1st of each year;
- posts signs close to fuel dispensers, which warn vehicle owners/operators against "topping off" of vehicle fuel tanks and installation of automatic shutoff fuel dispensing nozzles;
- routinely checks outdoor waste receptacle and air/water supply areas, cleans leaks and drips, and ensures that only watertight waste receptacles are used and that lids are closed; and
- trains employees to properly manage hazardous materials and wastes as well as to implement other storm water pollution prevention practices.

b) Phase I Facilities

Permittees need not inspect facilities that have been inspected by the Regional Board within the past 24 months. For the remaining Phase I facilities that the Regional Board has not inspected, each Permittee shall conduct compliance inspections as specified below.

Frequency of Inspection

Facilities in Tier 1 Categories: Twice during the 5-year term of the Order, provided that the first inspection occurs no later than August 1, 2004, and that there is a minimum interval of one year in between the first compliance inspection and the second compliance inspection.

Facilities in Tier 2 Categories: Twice during the 5-year term of the permit, provided that the first inspection occurs no later than August 1, 2004. Permittees need not perform additional inspections at those facilities determined to have no risk of exposure of industrial activity to storm water. For those facilities that do have exposure of industrial activities to storm water, a Permittee may reduce the frequency of additional compliance inspections to once every 5 years, provided that the Permittee inspects at least 20% of the facilities in Tier 2 each year.

Level of Inspection: Each Permittee shall confirm that each operator:

- has a current Waste Discharge Identification (WDID) number for facilities discharging storm water associated with industrial activity, and that a Storm Water Pollution Prevention Plan is available on-site, and
- is effectively implementing BMPs in compliance with County and municipal ordinances, Regional Board Resolution 98-08, and the SQMP.

c) Other Federally-mandated Facilities

Frequency of Inspection: Twice during the 5-year term of the Order, provided that the first inspection occurs no later than August 1, 2004, and that there is a minimum interval of one year in between the first compliance inspection and the second compliance inspection.

Level of Inspection: Each Permittee shall confirm that each operator:

- has a current Waste Discharge Identification (WDID) number for facilities discharging storm water associated with industrial activity, and that a Storm Water Pollution Prevention Plan is available on-site, and
- is effectively implementing BMPs in compliance with County and municipal ordinances, Regional Board Resolution 98-08, and the SQMP.

3. Ensure Compliance of Critical Sources

- a) **BMP Implementation:** In the event that a Permittee determines that a BMP specified by the SQMP or Regional Board Resolution 98-08 is infeasible at any site, that Permittee shall require implementation of other BMPs that will achieve the equivalent reduction of pollutants in the storm water discharges. Likewise, for those BMPs that are not adequate to achieve water quality objectives, Permittees may require additional site-specific controls, such as Treatment Control BMPs.
- b) **Environmentally Sensitive Areas and Impaired Waters:** For critical sources that are in ESAs or that are tributary to CWA § 303(d) impaired water bodies, Permittees shall consider requiring operators to implement additional controls to reduce pollutants in storm water runoff that are causing or contributing to the exceedences of Water Quality Objectives.
- c) **Progressive Enforcement:** Each Permittee shall implement a progressive enforcement policy to ensure that facilities are brought into compliance with all storm water requirements within a reasonable time period as specified below.
- (1) In the event that a Permittee determines, based on an inspection conducted above, that an operator has failed to adequately implement all necessary BMPs, that Permittee shall take progressive enforcement action which, at a minimum, shall include a follow-up inspection within 4 weeks from the date of the initial inspection.
 - (2) In the event that a Permittee determines that an operator has failed to adequately implement BMPs after a follow-up inspection, that Permittee shall take further enforcement action as established through authority in its municipal code and ordinances or through the judicial system.
 - (3) Each Permittee shall maintain records, including inspection reports, warning letters, notices of violations, and other enforcement records, demonstrating a good faith effort to bring facilities into compliance.

- d) Interagency Coordination
- (1) **Referral of Violations of the SQMP, Regional Board Resolution 98-08, and Municipal Storm Water Ordinances:** A Permittee may refer a violation(s) to the Regional Board provided that that Permittee has made a good faith effort of progressive enforcement. At a minimum, a Permittee's good faith effort must include documentation of:
 - Two follow-up inspections, and
 - Two warning letters or notices of violation.

 - (2) **Referral of Violations of the GIASP, including Requirements to File a Notice of Intent:** For those facilities in violation of the GIASP, Permittees may escalate referral of such violations to the Regional Board after one inspection and one written notice to the operator regarding the violation. In making such referrals, Permittees shall include, at a minimum, the following documentation:
 - Name of the facility;
 - Operator of the facility;
 - Owner of the facility;
 - Industrial activity being conducted at the facility that is subject to the GIASP; and
 - Records of communication with the facility operator regarding the violation, which shall include at least an inspection report and one written notice of the violation.

Permittees shall, at a minimum, make such referrals on a quarterly basis.

 - (3) **Investigation of Complaints Regarding Facilities – Transmitted by the Regional Board Staff:** Each Permittee shall initiate, within one business day, investigation of complaints (other than non-storm water discharges) regarding facilities within its jurisdiction. The initial investigation shall include, at a minimum, a limited inspection of the facility to confirm the complaint to determine if the facility is effectively complying with the SQMP and municipal storm water/urban runoff ordinances, and to oversee corrective action.

 - (4) **Support of Regional Board Enforcement Actions:** As directed by the Regional Board Executive Officer, Permittees shall support Regional Board enforcement actions by: assisting in identification of current owners, operators, and lessees of facilities; providing staff, when available, for joint inspections with Regional Board

inspectors; appearing as witnesses in Regional Board enforcement hearings; and providing copies of inspection reports and other progressive enforcement documentation.

- (5) **Participation in a Task Force:** The Permittees, Regional Board, and other stakeholders may form a Storm Water Task Force, the purpose of which is to communicate concerns regarding special cases of storm water violations by industrial and commercial facilities and to develop a coordinated approach to enforcement action.

D. Development Planning Program

The Permittees shall implement a development-planning program that will require all Planning Priority development and Redevelopment projects to:

- Minimize impacts from storm water and urban runoff on the biological integrity of Natural Drainage Systems and water bodies in accordance with requirements under CEQA (Cal. Pub. Resources Code § 21100), CWC § 13369, CWA § 319, CWA § 402(p), CWA § 404, CZARA § 6217(g), ESA § 7, and local government ordinances ;
- Maximize the percentage of pervious surfaces to allow percolation of storm water into the ground;
- Minimize the quantity of storm water directed to impervious surfaces and the MS4;
- Minimize pollution emanating from parking lots through the use of appropriate Treatment Control BMPs and good housekeeping practices;
- Properly design and maintain Treatment Control BMPs in a manner that does not promote the breeding of vectors; and
- Provide for appropriate permanent measures to reduce storm water pollutant loads in storm water from the development site.

1. Peak Flow Control

The Permittees shall control post-development peak storm water runoff discharge rates, velocities, and duration (peak flow control) in Natural Drainage Systems (i.e., mimic pre-development hydrology) to prevent accelerated stream erosion and to protect stream habitat. Natural Drainage Systems are located in the following areas:

- a) Malibu Creek;
- b) Topanga Canyon Creek;
- c) Upper Los Angeles River;
- d) Upper San Gabriel River;

- e) Santa Clara River; and
- f) Los Angeles County Coastal streams (see Basin Plan Table 2-1).

The Principal Permittee in consultation with Permittees shall develop numerical criteria for peak flow control, based on the results of the Peak Discharge Impact Study (see Monitoring Program Section II.I).

Each Permittee shall, no later than February 1, 2005, implement numerical criteria for peak flow control.

A Permittee or group of Permittees may substitute for the countywide peak flow control criteria with a Hydromodification Control Plan (HCP), on approval by the Regional Board, in the following circumstances:

- (1) Stream or watershed-specific conditions indicate the need for a different peak flow control criteria, and the alternative numerical criteria is developed through the application of hydrologic modeling and supporting field observations; or
- (2) A watershed-wide plan has been developed for implementation of control measures to reduce erosion and stabilize drainage systems on a watershed basis.

2. Standard Urban Storm Water Mitigation Plans (SUSMPs)

- a) Each Permittee shall amend codes and ordinances not later than August 1, 2002 to give legal effect to SUSMP changes contained in this Order. Changes to SUSMP requirements shall take effect not later than September 2, 2002.
- b) Each Permittee shall require that a single-family hillside home:
 - (1) Conserve natural areas;
 - (2) Protect slopes and channels;
 - (3) Provide storm drain system stenciling and signage;
 - (4) Divert roof runoff to vegetated areas before discharge unless the diversion would result in slope instability; and
 - (5) Direct surface flow to vegetated areas before discharge unless the diversion would result in slope instability.
- c) Each Permittee shall require that a SUSMP as approved by the Regional Board in Board Resolution No. R 00-02 be implemented for the following categories of developments:
 - (1) Ten or more unit homes (includes single family homes, multifamily homes, condominiums, and apartments);
 - (2) A 100,000 or more square feet of impervious surface area industrial/ commercial development;

- (3) Automotive service facilities (SIC 5013, 5014, 5541, 7532-7534, and 7536-7539);
 - (4) Retail gasoline outlets;
 - (5) Restaurants (SIC 5812);
 - (6) Parking lots 5,000 square feet or more of surface area or with 25 or more parking spaces; and
 - (7) Redevelopment projects in subject categories that meet Redevelopment thresholds.
- d) Each Permittee shall submit an ESA Delineation Map for its jurisdictional boundary, based on the Regional Board's ESA Definition, no later than June 3, 2002, for approval by the Regional Board Executive Officer in consultation with the California Department of Fish and Game, and the California Coastal Commission.
- e) Each Permittee shall require the implementation of SUSMP provisions no later than September 2, 2002, for all projects located in or directly adjacent to or discharging directly to an ESA, where the development will:
- (1) Discharge storm water and urban runoff that is likely to impact a sensitive biological species or habitat; and
 - (2) Create 2,500 square feet or more of impervious surface area.
3. Numerical Design Criteria

The Permittees shall require that post-construction Treatment Control BMPs incorporate, at a minimum, either a volumetric or flow based treatment control design standard, or both, as identified below to mitigate (infiltrate, filter or treat) storm water runoff:

- a) Volumetric Treatment Control BMP
- (1) The 85th percentile 24-hour runoff event determined as the maximized capture storm water volume for the area, from the formula recommended in *Urban Runoff Quality Management, WEF Manual of Practice No. 23/ ASCE Manual of Practice No. 87, (1998)*; or
 - (2) The volume of annual runoff based on unit basin storage water quality volume, to achieve 80 percent or more volume treatment by the method recommended in *California Stormwater Best Management Practices Handbook – Industrial/ Commercial, (1993)*; or

- (3) The volume of runoff produced from a 0.75 inch storm event, prior to its discharge to a storm water conveyance system; or
 - (4) The volume of runoff produced from a historical-record based reference 24-hour rainfall criterion for "treatment" (0.75 inch average for the Los Angeles County area) that achieves approximately the same reduction in pollutant loads achieved by the 85th percentile 24-hour runoff event.
- b) Flow Based Treatment Control BMP
- (1) The flow of runoff produced from a rain event equal to at least 0.2 inches per hour intensity; or
 - (2) The flow of runoff produced from a rain event equal to at least two times the 85th percentile hourly rainfall intensity for Los Angeles County; or
 - (3) The flow of runoff produced from a rain event that will result in treatment of the same portion of runoff as treated using volumetric standards above.

4. Applicability of Numerical Design Criteria

The Permittees shall require the following categories of Planning Priority Projects to design and implement post-construction treatment controls to mitigate storm water pollution:

- a) Single-family hillside residential developments of one acre or more of surface area;
- b) Housing developments (includes single family homes, multifamily homes, condominiums, and apartments) of ten units or more;
- c) A 100,000 square feet or more impervious surface area industrial/commercial development;
- d) Automotive service facilities (SIC 5013, 5014, 5541, 7532-7534 and 7536-7539) [5,000 square feet or more of surface area];
- e) Retail gasoline outlets [5,000 square feet or more of impervious surface area and with projected Average Daily Traffic (ADT) of 100 or more vehicles]. Subsurface Treatment Control BMPs which may endanger public safety (i.e., create an explosive environment) are considered not appropriate;
- f) Restaurants (SIC 5812) [5,000 square feet or more of surface area];
- g) Parking lots 5,000 square feet or more of surface area or with 25 or more parking spaces;

- h) Projects located in, adjacent to or discharging directly to an ESA that meet threshold conditions identified above in 2.e; and
 - i) Redevelopment projects in subject categories that meet Redevelopment thresholds.
5. Not later than March 10, 2003, each Permittee shall require the implementation of SUSMP and post-construction control requirements for the industrial/commercial development category to projects that disturb one acre or more of surface area.
6. Site Specific Mitigation

Each Permittee shall, no later than September 2, 2002, require the implementation of a site-specific plan to mitigate post-development storm water for new development and redevelopment not requiring a SUSMP but which may potentially have adverse impacts on post-development storm water quality, where one or more of the following project characteristics exist:

- a) Vehicle or equipment fueling areas;
 - b) Vehicle or equipment maintenance areas, including washing and repair;
 - c) Commercial or industrial waste handling or storage;
 - d) Outdoor handling or storage of hazardous materials;
 - e) Outdoor manufacturing areas;
 - f) Outdoor food handling or processing;
 - g) Outdoor animal care, confinement, or slaughter; or
 - h) Outdoor horticulture activities.
7. Redevelopment Projects

The Permittees shall apply the SUSMP, or site specific requirements including post-construction storm water mitigation to all Planning Priority Projects that undergo significant Redevelopment in their respective categories.

- a) Significant Redevelopment means land-disturbing activity that results in the creation or addition or replacement of 5,000 square feet or more of impervious surface area on an already developed site.

Where Redevelopment results in an alteration to more than fifty percent of impervious surfaces of a previously existing development, and the existing development was not subject to post development storm water quality control requirements, the entire project must be mitigated. Where Redevelopment results in an alteration to less than fifty percent of impervious surfaces of

a previously existing development, and the existing development was not subject to post development storm water quality control requirements, only the alteration must be mitigated, and not the entire development.

- b) Redevelopment does not include routine maintenance activities that are conducted to maintain original line and grade, hydraulic capacity, original purpose of facility or emergency redevelopment activity required to protect public health and safety.
- c) Existing single family structures are exempt from the Redevelopment requirements.

8. Maintenance Agreement and Transfer

Each Permittee shall require that all developments subject to SUSMP and site specific plan requirements provide verification of maintenance provisions for Structural and Treatment Control BMPs, including but not limited to legal agreements, covenants, CEQA mitigation requirements, and or conditional use permits. Verification at a minimum shall include:

- a) The developer's signed statement accepting responsibility for maintenance until the responsibility is legally transferred; and either
- b) A signed statement from the public entity assuming responsibility for Structural or Treatment Control BMP maintenance and that it meets all local agency design standards; or
- c) Written conditions in the sales or lease agreement, which requires the recipient to assume responsibility for maintenance and conduct a maintenance inspection at least once a year; or
- d) Written text in project conditions, covenants and restrictions (CCRs) for residential properties assigning maintenance responsibilities to the Home Owners Association for maintenance of the Structural and Treatment Control BMPs; or
- e) Any other legally enforceable agreement that assigns responsibility for the maintenance of post-construction Structural or Treatment Control BMPs.

9. Regional Storm Water Mitigation Program

A Permittee or Permittee group may apply to the Regional Board for approval of a regional or sub-regional storm water mitigation program to substitute in part or wholly SUSMP requirements. Upon review and a determination by the Regional Board Executive Officer that the proposal is technically valid and appropriate, the Regional Board may consider for approval such a program if its implementation will:

- a) Result in equivalent or improved storm water quality;

- b) Protect stream habitat;
- c) Promote cooperative problem solving by diverse interests;
- d) Be fiscally sustainable and has secure funding; and
- e) Be completed in five years including the construction and start-up of treatment facilities.

Nothing in this provision shall be construed as to delay the implementation of SUSMP requirements, as approved in this Order.

10. Mitigation Funding

The Permittees may propose a management framework, for endorsement by the Regional Board Executive Officer, to support regional or sub-regional solutions to storm water pollution, where any of the following situations occur:

- a) A waiver for impracticability is granted;
- b) Legislative funds become available;
- c) Off-site mitigation is required because of loss of environmental habitat; or
- d) An approved watershed management plan or a regional storm water mitigation plan exists that incorporates an equivalent or improved strategy for storm water mitigation.

11. California Environmental Quality Act (CEQA) Document Update

Each Permittee shall incorporate into its CEQA process, with immediate effect, procedures for considering potential storm water quality impacts and providing for appropriate mitigation when preparing and reviewing CEQA documents. The procedures shall require consideration of the following:

- a) Potential impact of project construction on storm water runoff;
- b) Potential impact of project post-construction activity on storm water runoff;
- c) Potential for discharge of storm water from areas from material storage, vehicle or equipment fueling, vehicle or equipment maintenance (including washing), waste handling, hazardous materials handling or storage, delivery areas or loading docks, or other outdoor work areas;
- d) Potential for discharge of storm water to impair the beneficial uses of the receiving waters or areas that provide water quality benefit;
- e) Potential for the discharge of storm water to cause significant harm on the biological integrity of the waterways and water bodies;

- f) Potential for significant changes in the flow velocity or volume of storm water runoff that can cause environmental harm; and
- g) Potential for significant increases in erosion of the project site or surrounding areas.

12. General Plan Update

- a) Each Permittee shall amend, revise or update its General Plan to include watershed and storm water quality and quantity management considerations and policies when any of the following General Plan elements are updated or amended: (i) Land Use, (ii) Housing, (iii) Conservation, and (iv) Open Space.
- b) Each Permittee shall provide the Regional Board with the draft amendment or revision when a listed General Plan element or the General Plan is noticed for comment in accordance with Cal. Govt. Code § 65350 *et seq.*

13. Targeted Employee Training

Each Permittee shall train its employees in targeted positions (whose jobs or activities are engaged in development planning) regarding the development planning requirements on an annual basis beginning no later than August 1, 2002, and more frequently if necessary. For Permittees with a population of 250,000 or more (2000 U.S. Census), training shall be completed no later than February 3, 2003.

14. Developer Technical Guidance and Information

- a) Each Permittee shall develop and make available to the developer community SUSMP (development planning) guidelines immediately.
- b) The Principal Permittee in partnership with Permittees shall issue no later than February 2, 2004, a technical manual for the siting and design of BMPs for the development community in Los Angeles County. The technical manual may be adapted from the revised California Storm Water Quality Task Force Best Management Practices Handbooks scheduled for publication in September 2002. The technical manual shall at a minimum include:
 - (1) Treatment Control BMPs based on flow-based and volumetric water quality design criteria for the purposes of countywide consistency;
 - (2) Peak Flow Control criteria to control peak discharge rates, velocities and duration;
 - (3) Expected pollutant removal performance ranges obtained from national databases, technical reports and the scientific literature;

- (4) Maintenance considerations; and
- (5) Cost considerations.

E. Development Construction Program

1. Each Permittee shall implement a program to control runoff from construction activity at all construction sites within its jurisdiction. The program shall ensure the following minimum requirements are effectively implemented at all construction sites:
 - a) Sediments generated on the project site shall be retained using adequate Treatment Control or Structural BMPs;
 - b) Construction-related materials, wastes, spills, or residues shall be retained at the project site to avoid discharge to streets, drainage facilities, receiving waters, or adjacent properties by wind or runoff;
 - c) Non-storm water runoff from equipment and vehicle washing and any other activity shall be contained at the project site; and
 - d) Erosion from slopes and channels shall be controlled by implementing an effective combination of BMPs (as approved in Regional Board Resolution No. 99-03), such as the limiting of grading scheduled during the wet season; inspecting graded areas during rain events; planting and maintenance of vegetation on slopes; and covering erosion susceptible slopes.
2. For construction sites one acre and greater, each Permittee shall comply with all conditions in section E.1. above and shall:
 - a) Require the preparation and submittal of a Local Storm Water Pollution Prevention Plan (Local SWPPP), for approval prior to issuance of a grading permit for construction projects.

The Local SWPPP shall include appropriate construction site BMPs and maintenance schedules. (A Local SWPPP may substitute for the State SWPPP if the Local SWPPP is at least as inclusive in controls and BMPs as the State SWPPP). The Local SWPPP must include the rationale used for selecting or rejecting BMPs. The project architect, or engineer of record, or authorized qualified designee, must sign a statement on the Local SWPPP to the effect:

“As the architect/engineer of record, I have selected appropriate BMPs to effectively minimize the negative impacts of this project’s construction activities on storm water quality. The project owner and contractor are aware that the selected BMPs must be installed, monitored, and maintained to ensure their effectiveness. The BMPs not selected for implementation are redundant or deemed not applicable to the proposed construction activity.”

The landowner or the landowner's agent shall sign a statement to the effect:

"I certify that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, to the best of my knowledge and belief, the information submitted is true, accurate, and complete. I am aware that submitting false and/or inaccurate information, failing to update the Local SWPPP to reflect current conditions, or failing to properly and/or adequately implement the Local SWPPP may result in revocation of grading and/or other permits or other sanctions provided by law."

The Local SWPPP certification shall be signed by the landowner as follows, for a corporation: by a responsible corporate officer which means (a) a president, secretary, treasurer, or vice president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision-making functions for the corporation, or (b) the manager of the construction activity if authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures; for a partnership or sole proprietorship: by a general partner or the proprietor; or for a municipality or other public agency: by an elected official, a ranking management official (e.g., County Administrative Officer, City Manager, Director of Public Works, City Engineer, District Manager), or the manager of the construction activity if authority to sign Local SWPPPs has been assigned or delegated to the manager in accordance with established agency policy.

- b) Inspect all construction sites for storm water quality requirements during routine inspections a minimum of once during the wet season. The Local SWPPP shall be reviewed for compliance with local codes, ordinances, and permits. For inspected sites that have not adequately implemented their Local SWPPP, a follow-up inspection to ensure compliance will take place within 2 weeks. If compliance has not been attained, the Permittee will take additional actions to achieve compliance (as specified in municipal codes). If compliance has not been achieved, and the site is also covered under a statewide general construction storm water permit, each Permittee shall enforce their local ordinance requirements, and if non-compliance continues the Regional Board shall be notified for further joint enforcement actions.
- c) Require, no later than March 10, 2003, prior to issuing a grading permit for all projects less than five acres requiring coverage under a statewide general construction storm water permit, proof of a Waste Discharger Identification (WDID) Number for filing a Notice of Intent (NOI) for permit coverage and a certification that a

SWPPP has been prepared by the project developer. A Local SWPPP may substitute for the State SWPPP if the Local SWPPP is at least as inclusive in controls and BMPs as the State SWPPP.

3. For sites five acres and greater, each Permittee shall comply with all conditions in Sections E.1. and E.2. and shall:
 - a) Require, prior to issuing a grading permit for all projects requiring coverage under the state general permit, proof of a Waste Discharger Identification (WDID) Number for filing a Notice of Intent (NOI) for coverage under the GCASP and a certification that a SWPPP has been prepared by the project developer. A Local SWPPP may substitute for the State SWPPP if the Local SWPPP is at least as inclusive in controls and BMPs as the State SWPPP.
 - b) Require proof of an NOI and a copy of the SWPPP at any time a transfer of ownership takes place for the entire development or portions of the common plan of development where construction activities are still on-going.
 - c) Use an effective system to track grading permits issued by each Permittee. To satisfy this requirement, the use of a database or GIS system is encouraged, but not required.
4. GCASP Violation Referrals
 - a) Referral of Violations of the SQMP, Regional Board Resolution 98-08, and municipal storm water ordinances:

A Permittee may refer a violation(s) to the Regional Board provided that the Permittee has made a good faith effort of progressive enforcement. At a minimum, a Permittee's good faith effort must include documentation of:

 - Two follow-up inspections within 3 months, and
 - Two warning letters or notices of violation.
 - b) Referral of Violations of GCASP Filing Requirements:

For those projects subject to the GCASP, Permittees shall refer non-filers (i.e., those projects which cannot demonstrate that they have a WDID number) to the Regional Board, within 15 days of making a determination. In making such referrals, Permittees shall include, at a minimum, the following documentation:

 - Project location;
 - Developer;
 - Estimated project size; and
 - Records of communication with the developer regarding filing requirements.
5. Each Permittee shall train employees in targeted positions (whose jobs or activities are engaged in construction activities including construction inspection staff) regarding the requirements of the storm water management program no later than August 1, 2002, and annually

thereafter. For Permittees with a population of 250,000 or more (2000 U.S. Census), initial training shall be completed no later than February 3, 2003. Each Permittee shall maintain a list of trained employees.

F. Public Agency Activities Program

Each Permittee shall implement a Public Agency program to minimize storm water pollution impacts from public agency activities. Public Agency requirements consist of:

- Sewage Systems Maintenance, Overflow, and Spill Prevention
 - Public Construction Activities Management
 - Vehicle Maintenance/Material Storage Facilities/Corporation Yards Management
 - Landscape and Recreational Facilities Management
 - Storm Drain Operation and Management
 - Streets and Roads Maintenance
 - Parking Facilities Management
 - Public Industrial Activities Management
 - Emergency Procedures
 - Treatment Feasibility Study
1. Sewage System Maintenance, Overflow, and Spill Prevention
 - a) Each Permittee shall implement a response plan for overflows of the sanitary sewer system within their respective jurisdiction, which shall consist at a minimum of the following:
 - (1) Investigation of any complaints received;
 - (2) Upon notification, immediate response to overflows for containment; and
 - (3) Notification to appropriate sewer and public health agencies when a sewer overflows to the MS4.
 - b) In addition to 1.a.1, 1.a.2, and 1.a.3 above, for those Permittees, which own and/or operate a sanitary sewer system, the Permittee shall also implement the following requirements:
 - (1) Procedures to prevent sewage spills or leaks from sewage facilities from entering the MS4; and
 - (2) Identify, repair, and remediate sanitary sewer blockages, exfiltration, overflow, and wet weather overflows from sanitary sewers to the MS4.

2. Public Construction Activities Management
 - a) Each Permittee shall implement the Development Planning Program requirements (Permit Part 4.D) at public construction projects.
 - b) Each Permittee shall implement the Development Construction Program requirements (Permit Part 4.E) at Permittee owned construction sites.
 - c) Each Permittee shall obtain coverage under the GCASP for public construction sites 5 acres or greater (or part of a larger area of development) except that a municipality under 100,000 in population (1990 U.S. Census) need not obtain coverage under a separate permit until March 10, 2003.
 - d) Each Permittee, no later than March 10, 2003, shall obtain coverage under a statewide general construction storm water permit for public construction sites for projects between one and five acres.
3. Vehicle Maintenance/Material Storage Facilities/Corporation Yards Management
 - a) Each Permittee, consistent with the SQMP, shall implement SWPPPs for public vehicle maintenance facilities, material storage facilities, and corporation yards which have the potential to discharge pollutants into storm water.
 - b) Each Permittee shall implement BMPs to minimize pollutant discharges in storm water including but not be limited to:
 - (1) Good housekeeping practices;
 - (2) Material storage control;
 - (3) Vehicle leaks and spill control; and
 - (4) Illicit discharge control.
 - c) Each Permittee shall implement the following measures to prevent the discharge of pollutants to the MS4:
 - (1) For existing facilities, that are not already plumbed to the sanitary sewer, all vehicle and equipment wash areas (except for fire stations) shall either be:
 - (i) Self-contained;
 - (ii) Equipped with a clarifier;
 - (iii) Equipped with an alternative pre-treatment device; or

- (iv) Plumbed to the sanitary sewer.
 - (2) For new facilities, or during redevelopment of existing facilities (including fire stations), all vehicle and equipment wash areas shall be plumbed to the sanitary sewer and be equipped with a pre-treatment device in accordance with requirements of the sewer agency.
- 4. Landscape and Recreational Facilities Management

Each Permittee shall implement the following requirements:

 - a) A standardized protocol for the routine and non-routine application of pesticides, herbicides (including pre-emergents), and fertilizers;
 - b) Consistency with State Board's guidelines and monitoring requirements for application of aquatic pesticides to surface waters (WQ Order No. 2001-12 DWQ);
 - c) Ensure no application of pesticides or fertilizers immediately before, during, or immediately after a rain event or when water is flowing off the area to be applied;
 - d) Ensure that no banned or unregistered pesticides are stored or applied;
 - e) Ensure that staff applying pesticides are certified by the California Department of Food and Agriculture, or are under the direct supervision of a certified pesticide applicator;
 - f) Implement procedures to encourage retention and planting of native vegetation and to reduce water, fertilizer, and pesticide needs;
 - g) Store fertilizers and pesticides indoors or under cover on paved surfaces or use secondary containment;
 - h) Reduce the use, storage, and handling of hazardous materials to reduce the potential for spills; and
 - i) Regularly inspect storage areas.
- 5. Storm Drain Operation and Management
 - a) Each Permittee shall designate catch basin inlets within its jurisdiction as one of the following:
 - Priority A: Catch basins that are designated as consistently generating the highest volumes of trash and/or debris.
 - Priority B: Catch basins that are designated as consistently generating moderate volumes of trash and/or debris.

Priority C: Catch basins that are designated as generating low volumes of trash and/or debris.

- b) Permittees subject to a trash TMDL (Ballona Creek WMA) shall continue to implement the requirements listed below until trash TMDL implementation measures are adopted. Thereafter, the subject Permittees shall implement programs in conformance with the TMDL implementation schedule, which shall include an effective combination of measures such as street sweeping, catch basin cleaning, installation of treatment devices and trash receptacles, or other BMPs. Default requirements include:
- (1) Inspection and cleaning of catch basins between May 1 and September 30 of each year;
 - (2) Additional cleaning of any catch basin that is at least 40% full of trash and/or debris;
 - (3) Record keeping of catch basins cleaned; and
 - (4) Recording of the overall quantity of catch basin waste collected.

If the implementation phase for the Los Angeles River and Ballona Creek Trash TMDLs has not begun by October 2003, subject Permittees shall implement the requirements described below in subsection 5(c), until such time programs in conformance with the subject Trash TMDLs are being implemented.

Permittees subject to the Los Angeles River Watershed Trash TMDL shall implement the requirements set forth in Part 7. Total Maximum Daily Load Provisions, subsection 1 "TMDL for Trash in the Los Angeles River Watershed".

- c) Permittees not subject to a trash TMDL shall:
- (1) Clean catch basins according to the following schedule:
 - Priority A: A minimum of three times during the wet season and once during the dry season every year.
 - Priority B: A minimum of once during the wet season and once during the dry season every year.
 - Priority C: A minimum of once per year.

In addition to the schedule above, between February 1, 2002 and July 1, 2003, Permittees shall ensure that any catch basin that is at least 40% full of trash and/or debris shall be cleaned out. After July 1, 2003, Permittees shall

ensure that any catch basin that is at least 25% full of trash and debris shall be cleaned out.

- (2) For any special event that can be reasonably expected to generate substantial quantities of trash and litter, include provisions that require for the proper management of trash and litter generated, as a condition of the special use permit issued for that event. At a minimum, the municipality who issues the permit for the special event shall arrange for either temporary screens to be placed on catch basins or for catch basins in that area to be cleaned out subsequent to the event and prior to any rain event.
 - (3) Place trash receptacles at all transit stops within its jurisdiction that have shelters no later than August 1, 2002, and at all other transit stops within its jurisdiction no later than February 3, 2003. All trash receptacles shall be maintained as necessary.
- d) Each Permittee shall inspect the legibility of the catch basin stencil or label nearest the inlet. Catch basins with illegible stencils shall be recorded and re-stenciled or re-labeled within 180 days of inspection.
 - e) Each Permittee shall implement BMPs for Storm Drain Maintenance that include:
 - (1) A program to visually monitor Permittee-owned open channels and other drainage structures for debris at least annually and identify and prioritize problem areas of illicit discharge for regular inspection;
 - (2) A review of current maintenance activities to assure that appropriate storm water BMPs are being utilized to protect water quality;
 - (3) Removal of trash and debris from open channel storm drains shall occur a minimum of once per year before the storm season;
 - (4) Minimize the discharge of contaminants during MS4 maintenance and clean outs; and
 - (5) Proper disposal of material removed.

6. Streets and Roads Maintenance

- a) Each Permittee shall designate streets and/or street segments within its jurisdiction as one of the following:
 - Priority A: Streets and/or street segments that are designated as consistently generating the highest volumes of trash and/or debris.

- Priority B: Streets and/or street segments that are designated as consistently generating moderate volumes of trash and/or debris.
- Priority C: Streets and/or street segments that are designated as generating low volumes of trash and/or debris.
- b) Each Permittee shall perform street sweeping of curbed streets according to the following schedule:
- Priority A: These streets and/or street segments shall be swept at least two times per month.
- Priority B: Each Permittee shall ensure that each street and/or street segments is swept at least once per month.
- Priority C: These streets and/or street segments shall be swept as necessary but in no case less than once per year.
- c) Each Permittee shall require that:
- (1) Sawcutting wastes be recovered and disposed of properly and that in no case shall waste be left on a roadway or allowed to enter the storm drain;
 - (2) Concrete and other street and road maintenance materials and wastes shall be managed to prevent discharge to the MS4; and
 - (3) The washout of concrete trucks and chutes shall only occur in designated areas and never discharged to storm drains, open ditches, streets, or catch basins.
- d) Each Permittee shall, no later than August 1, 2002, train their employees in targeted positions (whose interactions, jobs, and activities affect storm water quality) regarding the requirements of the storm water management program to:
- (1) Promote a clear understanding of the potential for maintenance activities to pollute storm water; and
 - (2) Identify and select appropriate BMPs.

For Permittees with a population of 250,000 or more (2000 U.S. Census) training shall be completed no later than February 1, 2003.

7. Parking Facilities Management

Permittee-owned parking lots exposed to storm water shall be kept clear of debris and excessive oil buildup and cleaned no less than 2 times per month and/or inspected no less than 2 times per month to determine if

cleaning is necessary. In no case shall a Permittee-owned parking lot be cleaned less than once a month.

8. Public Industrial Activities Management

Each Permittee shall, for any municipal activity considered a discharge of storm water associated with industrial activity, obtain separate coverage under the GIASP except that a municipality under 100,000 in population (1990 U.S. Census) need not file the Notice Of Intent to be covered by said permit until March 10, 2003 (with the exception of power plants, airports, and uncontrolled sanitary landfills).

9. Emergency Procedures

Each Permittee shall repair essential public services and infrastructure in a manner to minimize environmental damage in emergency situations such as: earthquakes; fires; floods; landslides; or windstorms. BMPs shall be implemented to the extent that measures do not compromise public health and safety. After initial emergency response or emergency repair activities have been completed, each Permittee shall implement BMPs and programs as required under this Order.

10. Treatment Feasibility Study

The Permittees in cooperation with the County Sanitation Districts of Los Angeles County shall conduct a study to investigate the possible diversion of dry weather discharges or the use of alternative Treatment Control BMPs to treat flows from their jurisdiction which may impact public health and safety and/or the environment. The Permittees shall collectively review their individual prioritized lists and create a watershed based priority list of drains for potential diversion or treatment and submit the priority listing to the Regional Board Executive Officer, no later than July 1, 2003.

G. Illicit Connections and Illicit Discharges Elimination Program

Permittees shall eliminate all illicit connections and illicit discharges to the storm drain system, and shall document, track, and report all such cases in accordance with the elements and performance measures specified in the following subsections.

1. General

- a) Implementation: Each Permittee must develop an Implementation Program which specifies how each Permittee is implementing revisions to the IC/ID Program of the SQMP. This Implementation Program must be documented, and available for review and approval by the Regional Board Executive Officer, upon request.

- b) Tracking: All Permittees shall, no later than February 3, 2003, develop and maintain a listing of all permitted connections to their storm drain system. All Permittees shall map at a scale and in a format specified by the Principal Permittee all illicit connections and discharges on their baseline maps, and shall transmit this information to the Principal Permittee. No later than February 3, 2003, the Principal Permittee shall use this information as well as results of baseline and priority screening for illicit connections (as set forth in subsection 2 below) to start an annual evaluation of patterns and trends of illicit connections and illicit discharges, with the objectives of identifying priority areas for elimination of illicit connections and illicit discharges.
- c) Training: All Permittees shall train all targeted employees who are responsible for identification, investigation, termination, cleanup, and reporting of illicit connections and discharges. For Permittees with a population of less than 250,000 (2000 U.S. Census), training shall be completed no later than August 1, 2002. For Permittees with a population of 250,000 or more (2000 U.S. Census), training shall be completed no later than February 3, 2003. Furthermore, all Permittees shall conduct refresher training on an annual basis thereafter.

2. Illicit Connections

a) Screening for Illicit Connections

- (1) Field Screening: All Permittees shall field Screen the storm drain system for illicit connections in accordance with the following schedule:

- (i) Open channels: No later than February 3, 2003;
- (ii) Underground pipes in priority areas: No later than February 1, 2005; and
- (iii) Underground pipes with a diameter of 36 inches or greater: No later than December 12, 2006.

Permittees shall report, to the Principal Permittee, on the location and length of open channels or underground pipes that have been Screened *vis a vis* the entire storm drain network, and on the status of suspected, confirmed, and terminated illicit connections. Permittees shall maintain a list containing all permitted connections and the status of connections under investigation for possible illicit connection.

- (2) Permit Screening: No later than December 12, 2006, Permittees shall complete a review of all permitted connections to the storm drain system, to confirm compliance with Part 1 (Discharge Prohibition).

- b) Response to Illicit Connections
 - (1) Investigation: Upon discovery or upon receiving a report of a suspected illicit connection, Permittees shall initiate an investigation within 21 days, to determine the source of the connection, the nature and volume of discharge through the connection, and the responsible party for the connection.
 - (2) Termination: Upon confirmation of the illicit nature of a storm drain connection, Permittees shall ensure termination of the connection within 180 days, using enforcement authority as needed.
- 3. Illicit Discharges
 - a) Abatement and Cleanup: Permittees shall respond, within one business day of discovery or a report of a suspected illicit discharge, with activities to abate, contain, and clean up all illicit discharges, including hazardous substances.
 - b) Investigation: Permittees shall investigate illicit discharges as soon as practicable (during or immediately following containment and cleanup activities), and shall take enforcement action as appropriate.

Part 5. DEFINITIONS

The following are definitions for terms applicable to this Order:

"Adverse Impact" means a detrimental effect upon water quality or beneficial uses caused by a discharge or loading of a pollutant or pollutants.

"Anti-degradation policies" means the *Statement of Policy with Respect to Maintaining High Quality Water in California* (State Board Resolution No. 68-16) which protects surface and ground waters from degradation. In particular, this policy protects waterbodies where existing quality is higher than that necessary for the protection of beneficial uses including the protection of fish and wildlife propagation and recreation on and in the water.

"Applicable Standards and Limitations" means all State, interstate, and federal standards and limitations to which a "discharge" or a related activity is subject under the CWA, including "effluent limitations, "water quality standards, standards of performance, toxic effluent standards or prohibitions, "best management practices," and pretreatment standards under sections 301, 302, 303, 304, 306, 307, 308, 403 and 404 of CWA.

"Areas of Special Biological Significance (ASBS)" means all those areas of this state as ASBS, listed specifically within the California Ocean Plan or so designated by the State Board which, among other areas, includes the area from Mugu Lagoon to Latigo Point: Oceanwater within a line originating from Laguna Point at 34° 5' 40" north, 119° 6'30" west, thence southeasterly following the mean high tideline to a point at Latigo Point defined by the intersection of the meanhigh tide line and a line extending due south of Benchmark 24; thence

Amended by Orders R4-2006-0074, R4-2007-0042, and R4-2009-0130, and further amended pursuant to L.A. Superior Court Case No. BS122724

due south to a distance of 1000 feet offshore or to the 100 foot isobath, whichever distance is greater; thence northwesterly following the 100 foot isobath or maintaining a 1,000-foot distance from shore, whichever maintains the greater distance from shore, to a point lying due south of Laguna Point, thence due north to Laguna Point.

"Authorized Discharge" means any discharge that is authorized pursuant to an NPDES permit or meets the conditions set forth in this Order.

"Automotive Service Facilities" means a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 5511, 7532-7534, or 7536-7539. For inspection purposes, Permittees need not inspect facilities with SIC codes 5013, 5014, 5541, 5511, provided that these facilities have no outside activities or materials that may be exposed to storm water.

"Baseline Waste Load Allocation" means the Waste Load Allocation assigned to a Permittee before reductions are required. The progressive reductions in the Waste Load Allocations are based on a percentage of the Baseline Waste Load Allocation. The Baseline Waste Load Allocation for each jurisdiction was calculated based on the annual average amount of trash discharged to the storm drain system from a representative sampling of land use areas, as determined during the Baseline Monitoring Program. The Baseline Waste Load Allocations are incorporated into the Basin Plan at Table 7-2.2.

"Basin Plan" means the Water Quality Control Plan, Los Angeles Region, Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties, adopted by the Regional Board on June 13, 1994 and subsequent amendments.

"Beneficial Uses" means the existing or potential uses of receiving waters in the permit area as designated by the Regional Board in the Basin Plan.

"Best Management Practices (BMPs)" means methods, measures, or practices designed and selected to reduce or eliminate the discharge of pollutants to surface waters from point and nonpoint source discharges including storm water. BMPs include structural and nonstructural controls, and operation and maintenance procedures, which can be applied before, during, and/or after pollution producing activities.

"Commercial Development" means any development on private land that is not heavy industrial or residential. The category includes, but is not limited to: hospitals, laboratories and other medical facilities, educational institutions, recreational facilities, plant nurseries, car wash facilities, mini-malls and other business complexes, shopping malls, hotels, office buildings, public warehouses and other light industrial complexes.

"Construction" means constructing, clearing, grading, or excavation that results in soil disturbance. Construction includes structure teardown. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility; emergency construction activities required to immediately protect public health and safety; interior remodeling with no outside exposure of construction material or construction waste to storm water; mechanical permit work; or sign permit work.

"Control" means to minimize, reduce, eliminate, or prohibit by technological, legal, contractual or other means, the discharge of pollutants from an activity or activities.

Amended by Orders R4-2006-0074, R4-2007-0042, and R4-2009-0130, and further amended pursuant to L.A. Superior Court Case No. BS122724

“Daily Generation Rate (DGR)” means the estimated amount of trash deposited within a representative drainage area during a 24-hour period, derived from the amount of trash collected from streets and catch basins in the area over a 30-day period.

“Dechlorinated/Debrominated Swimming Pool Discharge” means swimming pool discharges which have no measurable chlorine or bromine and do not contain any detergents, wastes, or additional chemicals not typically found in swimming pool water. The term does not include swimming pool filter backwash.

“Development” means any construction, rehabilitation, redevelopment or reconstruction of any public or private residential project (whether single-family, multi-unit or planned unit development); industrial, commercial, retail and other non-residential projects, including public agency projects; or mass grading for future construction. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.

“Directly Adjacent” means situated within 200 feet of the contiguous zone required for the continued maintenance, function, and structural stability of the environmentally sensitive area.

“Director” means the Director of a municipality and Person(s) designated by and under the Director’s instruction and supervision.

“Discharge” means when used without qualification the “discharge of a pollutant.”

“Discharging Directly” means outflow from a drainage conveyance system that is composed entirely or predominantly of flows from the subject, property, development, subdivision, or industrial facility, and not commingled with the flows from adjacent lands.

“Discharge of a Pollutant” means: any addition of any “pollutant” or combination of pollutants to “waters of the United States” from any “point source” or, any addition of any pollutant or combination of pollutants to the waters of the “contiguous zone” or the ocean from any point source other than a vessel or other floating craft which is being used as a means of transportation. The term discharge includes additions of pollutants into waters of the United States from: surface runoff which is collected or channeled by man; discharges through pipes, sewers, or other conveyances owned by a State, municipality, or other person which do not lead to a treatment works; and discharges through pipes, sewers, or other conveyances, leading into privately owned treatment works.

“Disturbed Area” means an area that is altered as a result of clearing, grading, and/or excavation.

“Environmentally Sensitive Areas (ESAs)” means an area in which plant or animal life or their habitats are either rare or especially valuable because of their special nature or role in an ecosystem and which would be easily disturbed or degraded by human activities and developments (California Public Resources Code § 30107.5). Areas subject to storm water mitigation requirements are: areas designated as Significant Ecological Areas by the County of Los Angeles (*Los Angeles County Significant Areas Study, Los Angeles County Department of Regional Planning (1976)* and amendments); an area designated as a Significant Natural Area

Amended by Orders R4-2006-0074, R4-2007-0042, and R4-2009-0130, and further amended pursuant to L.A. Superior Court Case No. BS122724

by the California Department of Fish and Game's Significant Natural Areas Program, provided that area has been field verified by the Department of Fish and Game; an area listed in the Basin Plan as supporting the "Rare, Threatened, or Endangered Species (RARE)" beneficial use; and an area identified by a Permittee as environmentally sensitive.

"Full Capture System" means any single device or series of devices, certified by the Executive Officer, that traps all particles retained by a 5 mm mesh screen and has a design treatment capacity of not less than the peak flow rate Q resulting from a one-year, one-hour storm in the sub-drainage area. The Rational Equation is used to compute the peak flow rate:

$$Q = C \times I \times A,$$

Where:

Q = design flow rate (cubic feet per second, cfs);

C = runoff coefficient (dimensionless);

I = design rainfall intensity (inches per hour, as determined per the Los Angeles County rainfall isohyetal maps relevant to the Los Angeles River watershed),⁷ and

A = sub-drainage area (acres).

"General Construction Activities Storm Water Permit (GCASP)" means the general NPDES permit adopted by the State Board which authorizes the discharge of storm water from construction activities under certain conditions.

"General Industrial Activities Storm Water Permit (GIASP)" means the general NPDES permit adopted by the State Board which authorizes the discharge of storm water from certain industrial activities under certain conditions.

"Hillside" means property located in an area with known erosive soil conditions, where the development contemplates grading on any natural slope that is 25% or greater and where grading contemplates cut or fill slopes.

"Illicit Connection" means any man-made conveyance that is connected to the storm drain system without a permit, excluding roof drains and other similar type connections. Examples include channels, pipelines, conduits, inlets, or outlets that are connected directly to the storm drain system.

"Illicit Discharge" means any discharge to the storm drain system that is prohibited under local, state, or federal statutes, ordinances, codes, or regulations. The term illicit discharge includes all non storm-water discharges except discharges pursuant to an NPDES permit, discharges that are identified in Part 1, "Discharge Prohibitions" of this order, and discharges authorized by the Regional Board Executive Officer.

"Illicit Disposal" means any disposal, either intentionally or unintentionally, of material(s) or waste(s) that can pollute storm water.

⁷ The isohyetal map may be updated annually by the Los Angeles County hydrologist to reflect additional rain data gathered during the previous year. Annual updates published by the Los Angeles County Department of Public Works are prospectively incorporated by reference into this Order.

"Industrial/Commercial Facility" means any facility involved and/or used in the production, manufacture, storage, transportation, distribution, exchange or sale of goods and/or commodities, and any facility involved and/or used in providing professional and non-professional services. This category of facilities includes, but is not limited to, any facility defined by the Standard Industrial Classifications (SIC). Facility ownership (federal, state, municipal, private) and profit motive of the facility are not factors in this definition.

"Infiltration" means the downward entry of water into the surface of the soil.

"Inspection" means entry and the conduct of an on-site review of a facility and its operations, at reasonable times, to determine compliance with specific municipal or other legal requirements. The steps involved in performing an inspection, include, but are not limited to:

1. Pre-inspection documentation research.;
2. Request for entry;
3. Interview of facility personnel;
4. Facility walk-through.
5. Visual observation of the condition of facility premises;
6. Examination and copying of records as required;
7. Sample collection (if necessary or required);
8. Exit conference (to discuss preliminary evaluation); and,
9. Report preparation, and if appropriate, recommendations for coming into compliance.

In the case of restaurants, a Permittee may conduct an inspection from the curbside, provided that such "curbside" inspection provides the Permittee with adequate information to determine an operator's compliance with BMPs that must be implemented per requirements of this Order, Regional Board Resolution 98-08, County and municipal ordinances, and the SQMP.

"Institutional Controls" means programmatic trash control measures that do not require construction or structural modifications to the MS4. Examples include street sweeping, public education, and clean out of catch basins that discharge to storm drains.

"Large Municipal Separate Storm Sewer System (MS4)" means all MS4s that serve a population greater than 250,000 (1990 Census) as defined in 40 CFR 122.26 (b)(4). The Regional Board designated Los Angeles County as a large MS4 in 1990, based on: (i) the U.S. Census Bureau 1990 population count of 8.9 million, and (ii) the interconnectivity of the MS4s in the incorporated and unincorporated areas within the County.

"Local SWPPP" means the Storm Water Pollution Prevention Plan required by the local agency for a project that disturbs one or more acres of land.

"Maximum Extent Practicable (MEP)" means the standard for implementation of storm water management programs to reduce pollutants in storm water. CWA § 402(p)(3)(B)(iii) requires that municipal permits "shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants. See also State Board Order WQ 2000-11 at page 20.

"Method Detection Limit (MDL)" means the minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero, as defined in 40 CFR 136, Appendix B.

"Minimum Level (ML)" means the concentration at which the entire analytical system must give a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

"Municipal Separate Storm Sewer System (MS4)" means a conveyance or system of conveyances (including roads with drainage systems, municipal streets, alleys, catch basins, curbs, gutters, ditches, manmade channels, or storm drains) owned by a State, city, county, town or other public body, that is designed or used for collecting or conveying storm water, which is not a combined sewer, and which is not part of a publicly owned treatment works, and which discharges to Waters of the United States.

"National Pollutant Discharge Elimination System (NPDES)" means the national program for issuing, modifying, revoking and reissuing, terminating, monitoring and enforcing permits, and imposing and enforcing pretreatment requirements, under CWA §307, 402, 318, and 405. The term includes an "approved program."

"Natural Drainage Systems" means unlined or unimproved (not engineered) creeks, streams, rivers or similar waterways.

"New Development" means land disturbing activities; structural development, including construction or installation of a building or structure, creation of impervious surfaces; and land subdivision.

"Non-Storm Water Discharge" means any discharge to a storm drain that is not composed entirely of storm water.

"Nuisance" means anything that meets all of the following requirements: (1) is injurious to health, or is indecent or offensive to the senses, or an obstruction to the free use of property, so as to interfere with the comfortable enjoyment of life or property; (2) affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent of the annoyance or damage inflicted upon individuals may be unequal.; (3) occurs during, or as a result of, the treatment or disposal of wastes.

"Parking Lot" means land area or facility for the parking or storage of motor vehicles used for businesses, commerce, industry, or personal use, with a lot size of 5,000 square feet or more of surface area, or with 25 or more parking spaces.

"Partial Capture Device" means any structural trash control device that has not been certified by the Executive Officer as meeting the "full capture" performance requirements.

"Permittee(s)" means Co-Permittees and any agency named in this Order as being responsible for permit conditions within its jurisdiction. Permittees to this Order include the Los Angeles County Flood Control District, Los Angeles County, and the cities of Agoura Hills, Alhambra, Arcadia, Artesia, Azusa, Baldwin Park, Bellflower, Bell Gardens, Beverly Hills,

Amended by Orders R4-2006-0074, R4-2007-0042, and R4-2009-0130, and further amended pursuant to L.A. Superior Court Case No. BS122724

Bradbury, Burbank, Calabasas, Carson, Cerritos, Claremont, Commerce, Compton, Covina, Cudahy, Culver City, Diamond Bar, Downey, Duarte, El Monte, El Segundo, Gardena, Glendale, Glendora, Hawaiian Gardens, Hawthorne, Hermosa Beach, Hidden Hills, Huntington Park, Industry, Inglewood, Irwindale, La Canada Flintridge, La Habra Heights, Lakewood, La Mirada, La Puente, La Verne, Lawndale, Lomita, Los Angeles, Lynwood, Malibu, Manhattan Beach, Maywood, Monrovia, Montebello, Monterey Park, Norwalk, Palos Verdes Estates, Paramount, Pasadena, Pico Rivera, Pomona, Rancho Palos Verdes, Redondo Beach, Rolling Hills, Rolling Hills Estates, Rosemead, San Dimas, San Fernando, San Gabriel, San Marino, Santa Clarita, Santa Fe Springs, Santa Monica, Sierra Madre, Signal Hill, South El Monte, South Gate, South Pasadena, Temple City, Torrance, Vernon, Walnut, West Covina, West Hollywood, Westlake Village, and Whittier.

“Planning Priority Projects” means those projects that are required to incorporate appropriate storm water mitigation measures into the design plan for their respective project. These types of projects include:

1. Ten or more unit homes (includes single family homes, multifamily homes, condominiums, and apartments)
2. A 100,000 or more square feet of impervious surface area industrial/commercial development (1 ac starting March 2003)
3. Automotive service facilities (SIC 5013, 5014, 5541, 7532-7534, and 7536-7539)
4. Retail gasoline outlets
5. Restaurants (SIC 5812)
6. Parking lots 5,000 square feet or more of surface area or with 25 or more parking spaces
7. Redevelopment projects in subject categories that meet Redevelopment thresholds
8. Projects located in or directly adjacent to or discharging directly to an ESA, which meet thresholds; and
9. Those projects that require the implementation of a site-specific plan to mitigate post-development storm water for new development not requiring a SUSMP but which may potentially have adverse impacts on post-development storm water quality, where the following project characteristics exist:
 - a) Vehicle or equipment fueling areas;
 - b) Vehicle or equipment maintenance areas, including washing and repair;
 - c) Commercial or industrial waste handling or storage;
 - d) Outdoor handling or storage of hazardous materials;
 - e) Outdoor manufacturing areas;
 - f) Outdoor food handling or processing;
 - g) Outdoor animal care, confinement, or slaughter; or
 - h) Outdoor horticulture activities.

"Pollutants" means those "pollutants" defined in CWA §502(6) (33.U.S.C. §1362(6)), and incorporated by reference into California Water Code §13373.

"Potable Water Distribution Systems Releases" means sources of flows from drinking water storage, supply and distribution systems including flows from system failures, pressure releases, system maintenance, distribution line testing, fire hydrant flow testing; and flushing and dewatering of pipes, reservoirs, vaults, and minor non-invasive well maintenance activities not involving chemical addition(s). It does not include wastewater discharges from activities that occur at wellheads, such as well construction, well development (i.e., aquifer pumping tests, well purging, etc.), or major well maintenance.

"Project" means all development, redevelopment, and land disturbing activities. The term is not limited to "Project" as defined under CEQA (Pub. Resources Code §21065).

"Rain Event" means any rain event greater than 0.1 inch in 24 hours except where specifically stated otherwise.

"Rare, Threatened, or Endangered Species (RARE)" means a beneficial use for waterbodies in the Los Angeles Region, as designated in the Basin Plan (Table 2-1), that supports habitats necessary, at least in part, for the survival and successful maintenance of plant or animal species established under state or federal law as rare, threatened, or endangered.

"Receiving Waters" means all surface water bodies in the Los Angeles Region that are identified in the Basin Plan.

"Redevelopment" means land-disturbing activity that results in the creation, addition, or replacement of 5,000 square feet or more of impervious surface area on an already developed site. Redevelopment includes, but is not limited to: the expansion of a building footprint; addition or replacement of a structure; replacement of impervious surface area that is not part of a routine maintenance activity; and land disturbing activities related to structural or impervious surfaces. It does not include routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of facility, nor does it include emergency construction activities required to immediately protect public health and safety.

"Regional Administrator" means the Regional Administrator of the Regional Office of the USEPA or the authorized representative of the Regional Administrator.

"Restaurant" means a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (SIC Code 5812).

"Retail Gasoline Outlet" means any facility engaged in selling gasoline and lubricating oils.

"Runoff" means any runoff including storm water and dry weather flows from a drainage area that reaches a receiving water body or subsurface. During dry weather it is typically comprised of base flow either contaminated with pollutants or uncontaminated, and nuisance flows.

"Screening" means using proactive methods to identify illicit connections through a continuously narrowing process. The methods may include: performing baseline monitoring of open channels, conducting special investigations using a prioritization approach, analyzing

maintenance records for catch basin and storm drain cleaning and operation, and verifying all permitted connections into the storm drains. Special investigation techniques may include: dye testing, visual inspection, smoke testing, flow monitoring, infrared, aerial and thermal photography, and remote control camera operation.

“Sidewalk Rinsing” means pressure washing of paved pedestrian walkways with average water usage of 0.006 gallons per square foot, with no cleaning agents, and properly disposing of all debris collected, as authorized under Regional Board Resolution No. 98-08.

“Significant Ecological Area (SEA)” means an area that is determined to possess an example of biotic resources that cumulatively represent biological diversity, for the purposes of protecting biotic diversity, as part of the Los Angeles County General Plan.⁸

Areas are designated as SEAs, if they possess one or more of the following criteria:

1. The habitat of rare, endangered, and threatened plant and animal species.
2. Biotic communities, vegetative associations, and habitat of plant and animal species that are either one of a kind, or are restricted in distribution on a regional basis.
3. Biotic communities, vegetative associations, and habitat of plant and animal species that are either one of a kind or are restricted in distribution in Los Angeles County.
4. Habitat that at some point in the life cycle of a species or group of species, serves as a concentrated breeding, feeding, resting, migrating grounds and is limited in availability either regionally or within Los Angeles County.
5. Biotic resources that are of scientific interest because they are either an extreme in physical/geographical limitations, or represent an unusual variation in a population or community.
6. Areas important as game species habitat or as fisheries.
7. Areas that would provide for the preservation of relatively undisturbed examples of natural biotic communities in Los Angeles County.
8. Special areas.⁹

“Significant Natural Area (SNA)” means an area defined by the California Department of Fish and Game (DFG), Significant Natural Areas Program, as an area that contains an important example of California's biological diversity. The most current SNA maps, reports, and descriptions can be downloaded from the DFG website at

<ftp://maphost.dfg.ca.gov/outgoing/whdab/sna/>. These areas are identified using the following biological criteria only, irrespective of any administrative or jurisdictional considerations:

1. Areas supporting extremely rare species or habitats.
2. Areas supporting associations or concentrations of rare species or habitats.
3. Areas exhibiting the best examples of rare species and habitats in the state.

⁸ The 61 existing SEAs represent the findings of a study that was completed in 1976 by England and Nelson, Environmental Consultants, as amended through the adoption of a revised Los Angeles County General Plan in 1980. The results of an update study to evaluate existing SEAs within unincorporated Los Angeles County is currently being proposed to the Los Angeles County Planning Commission (*Los Angeles County Significant Ecological Area Update Study 2000, Background Report*, PCR Services Corporation). The *Update Study 2000*, which contains existing and proposed SEA boundaries, can be downloaded from the Los Angeles County Department of Planning website at http://planning.co.la.ca.us/drp_revw.html#SEA

⁹ These criteria from the 1976 study have been modified in the *Update Study 2000*.

“**Site**” means the land or water area where any “facility or activity” is physically located or conducted, including adjacent land used in connection with the facility or activity.

“**Source Control BMP**” means any schedules of activities, prohibitions of practices, maintenance procedures, managerial practices or operational practices that aim to prevent storm water pollution by reducing the potential for contamination at the source of pollution.

“**SQMP**” means the Los Angeles Countywide Stormwater Quality Management Program.

“**State Storm Water Pollution Prevention Plan (State SWPPP)**” means a plan, as required by a State General Permit, identifying potential pollutant sources and describing the design, placement and implementation of BMPs, to effectively prevent non-stormwater Discharges and reduce Pollutants in Stormwater Discharges during activities covered by the General Permit.

“**Storm Water**” means storm water runoff, snow melt runoff, and surface runoff and drainage.

“**Storm Water Discharge Associated with Industrial Activity**” means industrial discharge as defined in 40 CFR 122.26(b)(14)

“**Stormwater Quality Management Program**” means the Los Angeles Countywide Stormwater Quality Management Program, which includes descriptions of programs, collectively developed by the Permittees in accordance with provisions of the NPDES Permit, to comply with applicable federal and state law, as the same is amended from time to time.

“**Structural BMP**” means any structural facility designed and constructed to mitigate the adverse impacts of storm water and urban runoff pollution (e.g. canopy, structural enclosure). The category may include both Treatment Control BMPs and Source Control BMPs.

“**SUSMP**” means the Los Angeles Countywide Standard Urban Stormwater Mitigation Plan. The SUSMP shall address conditions and requirements of new development.

“**Total Maximum Daily Load (TMDL)**” means the sum of the individual waste load allocations for point sources and load allocations for nonpoint sources and natural background.

“**Toxicity Identification Evaluation (TIE)**” means a set of procedures to identify the specific chemical(s) responsible for toxicity. These procedures are performed in three phases (characterization, identification, and confirmation) using aquatic organism toxicity tests.

“**Toxicity Reduction Evaluation (TRE)**” means a study conducted in a step-wise process to identify the causative agents of effluent or ambient toxicity, isolate the sources of toxicity, evaluate the effectiveness of toxicity control options, and then confirm the reduction in toxicity.

“**Treatment**” means the application of engineered systems that use physical, chemical, or biological processes to remove pollutants. Such processes include, but are not limited to, filtration, gravity settling, media absorption, biodegradation, biological uptake, chemical oxidation and UV radiation.

“Treatment Control BMP” means any engineered system designed to remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, media absorption or any other physical, biological, or chemical process.

“USEPA Phase I Facilities” means facilities in specified industrial categories that are required to obtain an NPDES permit for storm water discharges, as required by 40 CFR 122.26(c). These categories include:

- i. facilities subject to storm water effluent limitation guidelines, new source performance standards, or toxic pollutant effluent standards (40 CFR N)
- ii. manufacturing facilities
- iii. oil and gas/mining facilities
- iv. hazardous waste treatment, storage, or disposal facilities
- v. landfills, land application sites, and open dumps
- vi. recycling facilities
- vii. steam electric power generating facilities
- viii. transportation facilities
- ix. sewage of wastewater treatment works
- x. light manufacturing facilities

“Vehicle Maintenance/Material Storage Facilities/Corporation Yards” means any Permittee owned or operated facility or portion thereof that:

- i. Conducts industrial activity, operates equipment, handles materials, and provides services similar to Federal Phase I facilities;
- ii. Performs fleet vehicle service/maintenance on ten or more vehicles per day including repair, maintenance, washing, and fueling;
- iii. Performs maintenance and/or repair of heavy industrial machinery/equipment ; and
- iv. Stores chemicals, raw materials, or waste materials in quantities that require a hazardous materials business plan or a Spill Prevention, Control , and Counter-measures (SPCC) plan.

“Water Quality Standards and Water Quality Objectives” means water quality criteria contained in the Basin Plan, the California Ocean Plan, the National Toxics Rule, the California Toxics Rule, and other state or federally approved surface water quality plans. Such plans are used by the Regional Board to regulate all discharges, including storm water discharges.

“Waters of the State” means any surface water or groundwater, including saline waters, within boundaries of the state.

“Waters of the United States” or “Waters of the U.S.” means:

- a. All waters that are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide;
- b. All interstate waters, including interstate “wetlands”;
- c. All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, “wetlands,” sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds the use, degradation, or destruction of which would affect or could affect interstate or foreign commerce including any such waters:

Amended by Orders R4-2006-0074, R4-2007-0042, and R4-2009-0130, and further amended pursuant to L.A. Superior Court Case No. BS122724

1. Which are or could be used by interstate or foreign travelers for recreational or other purposes;
 2. From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or
 3. Which are used or could be used for industrial purposes by industries in interstate commerce;
- d. All impoundments of waters otherwise defined as waters of the United States under this definition;
- e. Tributaries of waters identified in paragraphs (a) through (d) of this definition;
- f. The territorial sea; and
- g. "Wetlands" adjacent to waters (other than waters that are themselves wetlands) identified in paragraph (a) through (f) of this definition.

Waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of CWA (other than cooling ponds as defined in 40 CFR 423.22(m), which also meet the criteria of this definition) are not waters of the United States. This exclusion applies only to man-made bodies of water, which neither were originally created in waters of the United States (such as disposal area in wetlands) nor resulted from the impoundment of waters of the United States. Waters of the United States do not include prior converted cropland. Notwithstanding the determination of an area's status as prior converted cropland by any other federal agency, for the purposes of the CWA, the final authority regarding CWA jurisdiction remains with USEPA.

"Wet Season" means the calendar period beginning October 1 through April 15.

Part 6. STANDARD PROVISIONS

A. Standard Requirements

1. Each Permittee shall comply with all provisions and requirements of this permit.
2. Should a Permittee discover a failure to submit any relevant facts or that it submitted incorrect information in a report, it shall promptly submit the missing or correct information.
3. Each Permittee shall report all instances of non-compliance not otherwise reported at the time monitoring reports are submitted.
4. This Order includes the attached Monitoring and Reporting Program, and SUSMP (Regional Board Resolution No. R00-02), which are a part of the permit and must be complied with in the same manner as with the rest of the requirements in the permit.

B. Regional Board Review

Any formal determination or approval made by the Regional Board Executive Officer pursuant to the provisions of this Order may be reviewed by the Regional Board. A Permittee(s) or a member of the public may request such review upon petition within 30 days of the effective date of the notification of such decision to the Permittee(s) and interested parties on file at the Regional Board.

C. Public Review

1. All documents submitted to the Regional Board in compliance with the terms and conditions of this Order shall be made available to members of the public pursuant to the Freedom of Information Act (5 U.S.C. § 552 (as amended) and the Public Records Act (Cal. Government Code § 6250 *et seq.*).
2. All documents submitted to the Regional Board Executive Officer for approval shall be made available to the public for a 30-day period to allow for public comment.

D. Duty to Comply

1. Each Permittee must comply with all of the terms, requirements, and conditions of this Order. Any violation of this order constitutes a violation of the Clean Water Act, its regulations and the California Water Code, and is grounds for enforcement action, Order termination, Order revocation and reissuance, denial of an application for reissuance; or a combination thereof [40 CFR 122.41(a), CWC § 13261, 13263, 13265, 13268, 13300, 13301, 13304, 13340, 13350].
2. A copy of these waste discharge specifications shall be maintained by each Permittee so as to be available during normal business hours to Permittee employees and members of the public.
3. Any discharge of wastes at any point(s) other than specifically described in this Order is prohibited, and constitutes a violation of the Order.

E. Duty to Mitigate [40 CFR 122.41 (d)]

Each Permittee shall take all reasonable steps to minimize or prevent any discharge that has a reasonable likelihood of adversely affecting human health or the environment.

F. Inspection and Entry [40 CFR 122.41(i), CWC § 13267]

The Regional Board, USEPA, and other authorized representatives shall be allowed:

1. Entry upon premises where a regulated facility is located or conducted, or where records are kept under conditions of this Order;
2. Access to copy any records, at reasonable times, that are kept under the conditions of this Order;
3. To inspect at reasonable times any facility, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order; and,

4. To photograph, sample, and monitor at reasonable times for the purpose of assuring compliance with this Order, or as otherwise authorized by the CWA and the CWC.

G. Proper Operation and Maintenance [40 CFR 122.41 (e), CWC § 13263(f)]

The Permittees shall at all times properly operate and maintain all facilities and systems of treatment (and related appurtenances) that are installed or used by the Permittees to achieve compliance with this Order. Proper operation and maintenance includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar system that are installed by a Permittee only when necessary to achieve compliance with the conditions of this Order.

H. Signatory Requirements [40 CFR 122.41(k) & 122.22]

Except as otherwise provided in this Order, all applications, reports, or information submitted to the Regional Board shall be signed by the Director of Public Works, City Engineer, or authorized designee and certified as set forth in 40 CFR 122.22.

I. Reopener and Modification [40 CFR 122.41(f) & 122.62]

1. This Order may only be modified, revoked, or reissued, prior to the expiration date, by the Regional Board, in accordance with the procedural requirements of the CWC and CCR Title 23 for the issuance of waste discharge requirements, 40 CFR 122.62, and upon prior notice and hearing, to:
 - a) Address changed conditions identified in the required reports or other sources deemed significant by the Regional Board;
 - b) Incorporate applicable requirements or statewide water quality control plans adopted by the State Board or amendments to the Basin Plan;
 - c) Comply with any applicable requirements, guidelines, and/or regulations issued or approved pursuant to CWA Section 402(p); and/or,
 - d) Consider any other federal, or state laws or regulations that became effective after adoption of this Order.
2. After notice and opportunity for a hearing, this Order may be terminated or modified for cause, including, but not limited to:
 - a) Violation of any term or condition contained in this Order;
 - b) Obtaining this Order by misrepresentation, or failure to disclose all relevant facts; or,
 - c) A change in any condition that requires either a temporary or permanent reduction or elimination of the authorized discharge.

3. The filing of a request by the Principal Permittee or Permittees for a modification, revocation and re-issuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any condition of this Order.
4. This Order may be modified to make corrections or allowances for changes in the permitted activity listed in this section, following the procedures at 40 CFR 122.63, if processed as a minor modification. Minor modifications may only:
 - a) Correct typographical errors, or
 - b) Require more frequent monitoring or reporting by the Permittee.

J. Severability

The provisions of this permit are severable; and if any provision of this permit or the application of any provision of this permit to any circumstance is held invalid, the application of such provision to other circumstances and the remainder of this permit shall not be affected.

K. Duty to Provide Information [40 CFR 122.41(h)]

The Permittees shall furnish, within a reasonable time, any information the Regional Board or USEPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Order. The Permittees shall also furnish to the Regional Board, upon request, copies of records required to be kept by this Order.

L. Twenty-four Hour Reporting [40 CFR 122.41(l)(6)]¹⁰

1. The Permittees shall report to the Regional Board any noncompliance that may endanger health or the environment. Any information shall be provided orally within 24 hours from the time any Permittee becomes aware of the circumstances. A written submission shall also be provided within five days of the time the Permittee becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times and, if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance.
2. The Regional Board may waive the required written report on a case-by-case basis.

M. Bypass [40 CFR 122.41(m)]¹¹

¹⁰ This provision applies to incidents where effluent limitations (numerical or narrative) as provided in this Order or in the Los Angeles County SQMP are exceeded, and which endanger public health or the environment.

Bypass (the intentional diversion of waste streams from any portion of a treatment facility) is prohibited. The Regional Board may take enforcement action against Permittees for bypass unless:

1. Bypass was unavoidable to prevent loss of life, personal injury or severe property damage. (Severe property damage means substantial physical damage to property, damage to the treatment facilities that causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production.);
2. There were no feasible alternatives to bypass, such as the use of auxiliary treatment facilities, retention of untreated waste, or maintenance during normal periods of equipment down time. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass that could occur during normal periods of equipment downtime or preventive maintenance;
3. The Permittee submitted a notice at least ten days in advance of the need for a bypass to the Regional Board; or,
4. Permittees may allow a bypass to occur that does not cause effluent limitations to be exceeded, but only if it is for essential maintenance to assure efficient operation. In such a case, the above bypass conditions are not applicable. The Permittee shall submit notice of an unanticipated bypass as required.

N. Upset [40 CFR 122.41(n)]¹²

Upset means an exceptional incident in which there is unintentional and temporary noncompliance with technology based permit effluent limitations because of factors beyond the reasonable control of the permittee. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation.

1. A Permittee that wishes to establish the affirmative defense of an upset in an action brought for non compliance shall demonstrate, through properly signed, contemporaneous operating logs, or other relevant evidence that:
 - a) An upset occurred and that the Permittee can identify the cause(s) of the upset;
 - b) The permitted facility was being properly operated by the time of the upset;

¹¹ This provision applies to the operation and maintenance of storm water controls and BMPs as provided in this Order or in the SQMP.

¹² *Supra*. See footnote number 3.

- c) The Permittee submitted notice of the upset as required; and,
 - d) The Permittee complied with any remedial measures required.
2. No determination made before an action for noncompliance, such as during administrative review of claims that non-compliance was caused by an upset, is final administrative action subject to judicial review.
 3. In any enforcement proceeding, the Permittee seeking to establish the occurrence of an upset has the burden of proof.

O. Property Rights [40 CFR 122.41(g)]

This Order does not convey any property rights of any sort, or any exclusive privilege.

P. Enforcement

1. Violation of any of the provisions of the NPDES permit or any of the provisions of this Order may subject the violator to any of the penalties described herein, or any combination thereof, at the discretion of the prosecuting authority; except that only one kind of penalties may be applied for each kind of violation. The CWA provides the following:
 - a) Criminal Penalties for:
 - (1) Negligent Violations:

The CWA provides that any person who negligently violates permit conditions implementing § 301, 302, 306, 307, 308, 318, or 405 is subject to a fine of not less than \$2,500 nor more than \$25,000 per day for each violation, or by imprisonment for not more than 1 year, or both.
 - (2) Knowing Violations:

The CWA provides that any person who knowingly violates permit conditions implementing § 301, 302, 306, 307, 308, 318, or 405 is subject to a fine of not less than \$5,000 nor more than \$50,000 per day of violation, or by imprisonment for not more than 3 years, or both.
 - (3) Knowing Endangerment:

The CWA provides that any person who knowingly violates permit conditions implementing § 301, 302, 307, 308, 318, or 405 and who knows at that time that he is placing another person in imminent danger of death or serious bodily injury is subject to a fine of not more than \$250,000, or by imprisonment for not more than 15 years, or both.
 - (4) False Statement:

The CWA provides that any person who knowingly makes any false material statement, representation, or certification in any application, record, report, plan, or other document filed or required to be maintained under the Act or who knowingly falsifies, tampers with, or renders inaccurate, any monitoring device or method required to be maintained under the Act, shall upon conviction, be punished by a fine of not more than \$10,000 or by imprisonment for not more than two years, or by both. If a conviction is for a violation committed after a first conviction of such person under this paragraph, punishment shall be by a fine of not more than \$20,000 per day of violation, or by imprisonment of not more than four years, or by both. (See CWA § 309(c)(4))

b) **Civil Penalties**

The CWA provides that any person who violates a permit condition implementing § 301, 302, 306, 307, 308, 318, or 405 is subject to a civil penalty not to exceed \$27,500 per day for each violation.

2. The CWC provides that any person who violates a waste discharge requirement provision of the CWC is subject to civil penalties of up to \$5,000 per day, \$10,000 per day, or \$25,000 per day of violation; or when the violation involves the discharge of pollutants, is subject to civil penalties of up to \$10 per gallon per day or \$25 per gallon per day of violation; or some combination thereof, depending on the violation or combination of violations.

Q. Need to Halt or Reduce Activity not a Defense [40 CFR 122.41(c)]

It shall not be a defense for a Permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Order.

R. Rescission

Regional Board Order No. 96-054 is hereby rescinded.

S. Expiration

This Order expires on December 12, 2006. The Permittees must submit a Report of Waste Discharges and a proposed Storm Water Quality Management Program in accordance with CCR Title 23 as application for reissuance of waste discharge requirements no later than June 12, 2006.

Part 7. TOTAL MAXIMUM DAILY LOAD PROVISIONS

The provisions of this Part implement and are consistent with the assumptions and requirements of Waste Load Allocations from TMDLs for which some or all of the Permittees in this Order are responsible.

1. TMDL for Trash in the Los Angeles River Watershed

- A. Waste Load Allocations: Each Permittee identified in Appendix 7-1 shall comply with the interim and final effluent limitations set forth in Appendix 7-1 hereto.¹³
- B. Compliance:
- (1) Permittees may comply with the effluent limitations using any lawful means. Such compliance options are broadly classified as *full capture*, *partial capture*, or *institutional controls*, as described below, and any combination of these may be employed to achieve compliance:
- (a) Full Capture Systems:
- 1) The Basin Plan authorizes the Executive Officer to certify *full capture systems*, which are systems that meet the operating and performance requirements as described in this Order, and the procedures identified in "Procedures and Requirements for Certification of a Best Management Practice for Trash Control as a Full Capture System." (See Appendix 7-2.)¹⁴
 - 2) Permittees are authorized to comply with their effluent limitations through certified *full capture systems* provided the requirements of paragraph 3), immediately below, and any conditions in the certification, continue to be met.
 - 3) Permittees may comply with their effluent limitations through progressive installation of *full capture systems* throughout their jurisdiction until all areas draining to the Los Angeles River system are addressed. For purposes of this Permit, attainment of the effluent limitations shall be conclusively presumed for any drainage area to the Los Angeles River (or its tributaries)¹⁵ where certified *full capture systems* treat all drainage from the area, provided that the *full capture systems* are adequately sized and maintained, and that maintenance records are up-to-date and available for inspection by the Regional Board.
 - i. A Permittee relying entirely on *full capture systems* shall be deemed in compliance with its final effluent limitation if it demonstrates that all drainage areas

¹³ The interim and final effluent limitations set forth in Appendix 7-1 are equivalent to the Compliance Points identified in Table 7-2.3 of the Basin Plan.

¹⁴ The Regional Board currently recognizes eight *full capture systems*. These are: Vortex Separation Systems (VSS) and seven other Executive Officer certified *full capture systems*, including specific types or designs of trash nets; two gross solids removal devices (GSRDs); catch basin brush inserts and mesh screens; vertical and horizontal trash capture screen inserts; and a connector pipe screen device.

¹⁵ Tributaries to the Los Angeles River include, but are not limited to, Pacoima Wash, Tujunga Wash, Burbank Western Channel, Verdugo Wash, Arroyo Seco, Rio Hondo, and Compton Creek.

under its jurisdiction are serviced by appropriate certified *full capture systems* as described in paragraph (a)(3).

- ii. A Permittee relying entirely on *full capture systems* shall be deemed in compliance with its interim effluent limitations:
 1. By demonstrating that *full capture systems* treat the percentage of drainage areas in the watershed that corresponds to the required trash abatement.
 2. Alternatively, a Permittee may propose a schedule for jurisdiction-wide installation of *full capture systems*, targeting first the areas of greatest trash generation (based upon the information on drainage area and litter generation rates by land use provided in Appendices I and III of the Los Angeles River Trash TMDL Staff Report) for the Executive Officer's approval. The Executive Officer shall not approve any such schedule that does not result in timely compliance with the final effluent limitations. A Permittee shall be deemed in compliance with its interim effluent limitations provided it is fully in compliance with any such approved schedule.

(b) Partial Capture Devices and Institutional Controls: Permittees may comply with their interim and final effluent limitations through the installation of *partial capture devices* and the application of *institutional controls*.¹⁶

- 1) Trash discharges from areas serviced solely by *partial capture devices* may be estimated based on demonstrated performance of the device(s) in the jurisdictional area.¹⁷ That is, trash reduction is equivalent to the *partial capture devices'* trash removal efficiency multiplied by the percentage of drainage area serviced by the devices.
- 2) Except as provided in subdivision 3), below, trash discharges from areas addressed by *institutional controls* and/or *partial capture devices* (where site-specific performance data is not available) shall be calculated using a mass balance approach, based on the daily generation rate (DGR) for a representative area.¹⁸ The DGR shall be determined from direct measurement of

¹⁶ While interim effluent limitations may be complied with using partial capture devices, compliance with final effluent limitations cannot be achieved with the exclusive use of partial capture devices.

¹⁷ Performance shall be demonstrated under different conditions (e.g. low to high trash loading).

¹⁸ The area should be representative of the land uses within the jurisdiction and shall be approved by the Executive Officer prior to the 30-day collection period.

trash deposited in the drainage area during any thirty-day period between June 22nd and September 22nd exclusive of rain events¹⁹, and shall be re-calculated every year thereafter. The DGR shall be calculated as the total amount of trash collected during this period divided by 30 (the length of the collection period).

DGR = (Amount of trash collected during a 30-day collection period²⁰) / (30 days)

The DGR for the applicable area of the jurisdiction shall be extrapolated from that of the representative drainage area. A mass balance equation shall be used to estimate the amount of trash discharged during a storm event.²¹ The *Storm Event Trash Discharge* for a given rain event in a Permittee's drainage area shall be calculated by multiplying the number of days since the last street sweeping by the DGR and subtracting the amount of any trash recovered in the catch basins.²² For each day of a storm event that generates precipitation greater than 0.25 inches, the Permittee shall calculate a *Storm Event Trash Discharge*.

Storm Event Trash Discharge = [(Days since last street sweeping*DGR)] – [Amount of trash recovered from catch basins]²³

The sum of the *Storm Event Trash Discharges* for the storm year shall be the Permittee's calculated annual trash discharge.

Total Storm Year Trash Discharge = ∑ Storm Event Trash Discharges from Drainage Area

- 3) The Executive Officer may approve alternative compliance monitoring approaches for calculating total storm year trash discharge, upon finding that the program will provide a scientifically-based estimate of the amount of trash discharged from the MS4.

(c) Combined Compliance Approaches:

¹⁹ Provided no special events are scheduled that may affect the representative nature of that collection period.

²⁰ Between June 22nd and September 22nd

²¹ Amount of trash shall refer to the uncompressed volume (in gallons) or drip-dry weight (in pounds) of trash collected.

²² Any negative values shall be considered to represent a zero discharge.

²³ When more than one storm event occurs prior to the next street sweeping the discharge shall be calculated from the date of the last assessment.

Permittees may comply with their interim and final effluent limitations through a combination of *full capture systems*, *partial capture devices*, and *institutional controls*. Permittees relying on a combination of approaches shall demonstrate compliance with the interim and final effluent limitations as specified in (a)(3) in areas where *full capture systems* are installed and as specified in (b)(2) in areas where *partial capture devices* and *institutional controls* are applied.

- (2) Permittees that are not in compliance with the applicable interim and/or final effluent limitations as identified in Appendix 7-1 shall be in violation of this permit.
 - (a) Permittees relying on *partial capture devices* and/or *institutional controls* that have violated their interim or final effluent limitations as identified in Appendix 7-1 shall be presumed to have violated the applicable limitation for each day of each storm event that generated precipitation greater than 0.25 inches during the applicable storm year, except those storm days on which they establish that their cumulative Storm Event Trash Discharges have not exceeded the applicable effluent limitation.
 - (b) For Permittees relying on full capture systems who have failed to demonstrate that the *full capture systems* for any drainage area are adequately sized and maintained, and that maintenance records are up-to-date and available for inspection by the Regional Board, and that they are in compliance with any conditions of their certification, shall be presumed to have discharged trash in an amount that corresponds to the percentage of the baseline waste load allocation represented by the drainage area in question.
 - 1) A Permittee may overcome this presumption by demonstrating (using any of the methods authorized in this Part 7.1.B(1)(b)) that the actual or calculated discharge for that drainage area is in compliance with the applicable interim or final effluent limitations as specified in Appendix 7-1.
- (3) Each Permittee shall be held liable for violations of the Effluent Limitations assigned to its jurisdiction in Appendix 7-1. Any Permittee whose compliance strategy includes full or partial capture devices and who chooses to install a full or partial capture device in the MS4 physical infrastructure of another public entity is responsible for obtaining all necessary permits to do so. If a Permittee believes it is unable to obtain the permits needed to install a full capture or partial capture device within another Permittee's MS4 physical infrastructure, either Permittee may request the Executive Officer to hold a conference with the Permittees. Nothing in this Order shall affect the right of that public entity or a Permittee to seek indemnity or other recourse from the other as they deem appropriate. Nothing in this subsection shall be construed as relieving a Permittee of any liability that the Permittee would otherwise have under this Order.

C. Monitoring and Reporting Requirements (pursuant to Water Code section 13383)

- (1) Within 60 days of adoption of Part 7, Section 1 (Los Angeles River Trash TMDL) and on October 31, 2010 and every year thereafter, each Permittee identified in Appendix 7-1 shall submit a TMDL Compliance Report detailing compliance with the interim and final effluent limitations. Reporting shall include the information specified below. The report shall be submitted on a reporting form to be specified by the Executive Officer. The report shall be signed under penalty of perjury by the Director of Public Works or other agency head (or their delegee) that is responsible for ensuring compliance with this permit. Permittees shall be charged with and shall demonstrate compliance with the relevant effluent limitations beginning with their October 31, 2010 TMDL Compliance Report.
 - (a) Reporting Compliance based on Full Capture Systems:
Permittees identified in Appendix 7-1 shall provide information on the number and location of full capture installations, the sizing of each full capture installation, the drainage areas addressed by these installations, and compliance with the applicable interim or final effluent limitation, in their TMDL Compliance Report. The Regional Board will periodically audit sizing, performance, and other data to validate that a system satisfies the criteria established for a *full capture system* and any conditions established by the Executive Officer in the certification.
 - (b) Reporting Compliance based on Partial Capture Systems and/or Institutional Controls:
 - (1) Using Performance Data Specific to the Jurisdictional Area: Permittees identified in Appendix 7-1 shall provide (i) site-specific performance data for the applicable device(s), (ii) information on the number and location of such installations, and the drainage areas addressed by these installations, and (iii) calculated compliance with the applicable effluent limitations, in their TMDL Compliance Report.
 - (2) Using Direct Measurement of Trash Discharge: Permittees identified in Appendix 7-1 shall provide an accounting of DGR and trash removal via street sweeping, catch basin clean outs, etc., in a database to facilitate the calculation of discharge for each rain event. The database shall be maintained and provided to the Regional Board for inspection upon request. Permittees identified in Appendix 7-1 shall provide the annual DGR, calculated storm year discharge, and compliance with the applicable effluent limitation, in their TMDL Compliance Report.
 - (c) Reporting Compliance based on Combined Compliance Approaches:
Permittees identified in Appendix 7-1 shall provide the information specified in subsection (a) for areas where full capture systems are installed and that specified in subsection (b)(1) or (b)(2), as appropriate, for areas where partial capture devices and institutional controls are applied. Permittees shall also provide information on compliance with the applicable effluent limitation based on the combined compliance approaches, in their TMDL Compliance Report

(2) Violation of the reporting requirements of this Part shall be punishable pursuant to inter alia Water Code subdivision (a)(1) of section 13385.1 and/or subdivision (a)(3) of section 13385.

I, Samuel Unger, Regional Board Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of the Order amended by the California Regional Water Quality Control Board, Los Angeles Region, pursuant to the peremptory writ of mandate in L.A. Superior Court Case No. BS122724, and that such action occurred on April 14, 2011.

Samuel Unger, P.E.
Executive Officer

Appendix 7-1

**Interim and Final Effluent Limitations for Trash for Permittees Identified as Responsible
Jurisdictions in the Los Angeles River Watershed Trash TMDL**

Table 1a: Los Angeles River Watershed Trash Effluent Limitations¹ per Storm Year²

LOS ANGELES REGIONAL WATER QUALITY CONTROL BOARD

DATE: August 3, 2004

SUBJECT: PROCEDURES AND REQUIREMENTS FOR CERTIFICATION OF A BEST MANAGEMENT PRACTICE FOR TRASH CONTROL AS A FULL CAPTURE SYSTEM

This memorandum describes Regional Board procedures and information required in order to perform a technical evaluation to certify a best management practices (BMP) as a "full capture system" for the control of trash.

Background

The Los Angeles Regional Water Quality Control Board adopted the definition of "full capture system" for the Ballona Creek Trash TMDL per Resolution No. 04-023 on March 4, 2004. This definition will be considered applicable for all receiving waters in the Los Angeles Region identified as being impaired for Trash. The Regional Board staff will analyze all future proposed BMPs for certification as a "full capture system" based on the Ballona Creek Trash TMDL definition.

The definition of a "full capture system" as defined in the Resolution No. 04-023 is as follows:

" A full capture system is any single device or series of devices that traps all particles retained by a 5 mm mesh screen and has a design treatment capacity of not less than the peak flow rate (Q) resulting from a one-year, one-hour, storm in the subdrainage area. Rational equation is used to compute the peak flow rate: $Q = C \times I \times A$, where Q = design flow rate (cubic feet per second, cfs); C = runoff coefficient (dimensionless); I = design rainfall intensity (inches per hour, as determined per the rainfall isohyetal map), and A = subdrainage area (acres)."

Essential Technical Information

In order to perform a technical analysis and consider for certification approval, the Regional Board staff requests the following information from dischargers for evaluation of their BMPs as a "full capture system" for trash:

California Environmental Protection Agency

Recycled Paper

Our mission is to preserve and enhance the quality of California's water resources for the benefit of present and future generations

1. Subdrainage area, A that only drains into the pipe containing BMP.
2. Hydraulic capacity of the pipe containing BMP at cubic feet per second.
3. Average runoff coefficient , C where

$$C = (A1*C1 + A2*C2 + A3*C3 +An*Cn) / (A1 + A2 +A3 +An)$$

A1 through An represents subareas for each land use, and
C1 through Cn represents runoff coefficients for each land use

4. The reported BMP treatment capacity at cubic feet per second.

Los Angeles County Department of Public Works (LACDPW) has already provided an isohyetal map for one-year, one- hour rainfall intensity per definition of a full capture system. For certification, BMP must trap all particles retained by a 5-mm mesh screen, and have a treatment capacity exceeding peak flow rate resulting from a one-year, one-hour, storm in the subdrainage area. In addition, the following requirements must be met:

- End-of-Pipe Configuration: Certain BMPs, which can create a pressure drop, must have an end-of-pipe configuration and not rely on diversion weirs.
- Adequate Pipe Sizing: The pipes carrying the flows from the subdrainage area should be able to handle peak flows.
- Regular Inspections and Maintenance: The full capture system must be regularly inspected and serviced to continually maintain adequate flow through capacity.

Conditional Transferability

The determination and certification that the BMP satisfies the “full capture system” definition of the trash TMDL will allow the system to be used elsewhere in the region. Dischargers will have an on-going obligation to demonstrate that the installation of a particular system is appropriately sized. Likewise, dischargers will be responsible for on-going maintenance to ensure the systems perform to design specifications. The Regional Board will review and consider performance data on continuing basis. In the event data demonstrate that the systems are not performing to the full capture design standard established by the trash TMDL, then the Regional Board reserves the ability to rescind the certification for subsequent installations.

Process for Submittal

A letter requesting “full capture system certification” along with supporting documentation must be submitted to the Regional Board Executive Officer to start the process. Within thirty (30) days of receipt of the letter and documentation, the Regional Board staff will contact the proponent, and schedule a time for a presentation to Regional Board staff and to perform a site survey if necessary. At the conclusion of the presentation, Regional Boards staff will

communicate orally to the proponent any supplemental documentation or information that needs to be submitted to complete the evaluation of the proposed BMP as a "full capture system". A letter acknowledging the receipt of the certification request and identifying any supplemental documentation to be submitted will be sent within 15 days of the completion of the presentation. Regional Board staff will make a written determination on the certification of the proposed BMP as a full capture system within ninety (90) days after the receipt of all requested documentation.

Monitoring and Reporting Program No. 6948

I. Program Reporting Requirements

The Principal Permittee shall submit, no later than October 15 of each year beginning in the year 2002, a Unified Annual Storm Water Report (Unified Annual Report) documenting the progress of Permittees' implementation of the SQMP and the requirements of this Order. The Unified Annual Report shall contain a section covering common activities conducted collectively by the Permittees, and an integrated summary of the Monitoring Program results. Each Permittee shall submit an Individual Annual Report to the Principal Permittee, by the date determined by the Principal Permittee, to be included in the Unified Annual Report. The Unified Annual Reports shall cover each fiscal year from July 1 through June 30. The first Unified Annual Report, to be submitted on October 15, 2002, shall report for the period from July 1, 2001 through June 30, 2002. Specific requirements that must be addressed in the Annual Reports are listed below.

A. Unified Annual Report

The Principal Permittee shall include the following in the Unified Annual Report:

1. A compilation of Permittee Individual Annual Reports.
2. Proposed changes to the SQMP, as recommended by the WMCs.
3. An assessment of the effectiveness of SQMP requirements to reduce storm water pollution. This assessment shall be comprised of a compilation of watershed-wide assessments conducted by each WMC. Assessments shall be based upon the specific record-keeping information requirement in each section of the permit, monitoring data, summaries of program effectiveness from each Permittee, and any other information related to program effectiveness. The program assessment shall include summaries of the following:
 - a) Summary of common activities conducted by all Permittees;
 - b) WMA BMP implementation;
 - c) Identification of management measures proven to be effective and/or ineffective at reducing urban runoff pollutants and flow;
 - d) Permittee level of effort, as indicated in their Individual Annual Report self evaluations (Attachment U-4, section VI); and
 - e) Integrated summary of Monitoring Program results, including the identification of water quality improvements or degradation, and recommendations for improvements to the SQMP (including proposed BMPs) based on the results from the Monitoring Program.

4. Pursuant to Part 2 of this Order, after a determination by either a Permittee or the Regional Board that discharges are causing or contributing to an exceedance of an applicable Water Quality Standard, a Receiving Water Limitations (RWL) Compliance Report shall be attached to the subsequent Unified Annual Report. A status RWL Compliance Report shall be submitted every alternate year following the submittal of the first Report. The RWL Compliance Report shall include the following:
 - a) A plan to comply with the RWL (Part 2 of this Order);
 - b) Changes to the SQMP to eliminate water quality exceedances;
 - c) Enhanced monitoring to demonstrate compliance; and
 - d) Results of implementation.

After all water quality exceedances have been abated, a RWL Compliance Report is not required.

B. Individual Annual Reports

Each Individual Annual Report shall document and describe all activities conducted by a Permittee to meet all requirements of this Order, during the completed annual reporting period. Individual Annual Reports shall use the attached form (Attachment U-4), or create another reporting format that includes all items on the attached form. Each Permittee shall complete the form in its entirety, except for those requirements applicable only to the Principal Permittee, as indicated on the form. Status of compliance with permit requirements including implementation dates for all time-specific deadlines should be included for each program area. If permit deadlines are not met, Permittees shall report the reasons why the requirement was not met and how the requirements will be met in the future, including projected implementation dates. A comparison of program implementation results to performance standards established in this Order and in the SQMP shall be included for each program area.

C. Monitoring Program Management

The Principal Permittee shall submit a Storm Water Monitoring Report (Monitoring Report) on August 15, 2002, and annually on August 15, thereafter. The Monitoring Report to be submitted on August 15, 2002 shall include the results of monitoring from July 1, 2001 through June 30, 2002. Each Monitoring Report shall include:

1. Status of implementation of the Monitoring Program.
2. Data, results, methods of evaluating the data, graphical summaries of the data, and an explanation/discussion of the data for each component of the monitoring program, including any specific reporting requirements included in Section II. Monitoring Program.
3. An analysis of the findings of each Monitoring Program component. The analysis shall identify and prioritize water quality problems. Based on the identification and prioritization of water quality problems, the analysis shall identify potential sources of the problems, and recommend future

monitoring and BMP implementation measures for identifying and addressing the sources. The analysis shall also include an evaluation of the effectiveness of existing control measures.

4. Identification and analysis of any long-term trends in storm water or receiving water quality.
5. An estimation of total pollutant loads due to storm water/urban runoff for each mass emission station.
6. A comparison to the applicable Water Quality Standards for each component of the Monitoring Program. The lowest applicable standard from the Basin Plan, the Ocean Plan, or the CTR shall be used for comparison. Constituents that exceed applicable Water Quality Standards shall be highlighted. When data indicate that discharges are causing or contributing to exceedances of applicable Water Quality Standards, a discussion of possible pollutant sources shall be included in the Monitoring Report and a RWL Compliance Report (Section I.A.4) shall be submitted with the subsequent Unified Annual Report.
7. For each monitoring component, maps of all monitoring station locations and descriptions of each location.
8. All Monitoring Reports shall be submitted in both electronic and paper formats.

D. Integrated Receiving Water Impacts Report

The Principal Permittee shall, not later than August 15, 2005, prepare and submit an Integrated Receiving Water Impacts Report, which may also serve as the fourth-year Monitoring Report. The Report shall include, but not be limited to, a comprehensive analysis of the results of the data from each component of the Monitoring Program, and other pertinent studies available, and feasible environmental indicators. It should also include a budget summary for each monitoring requirement and recommendations on future monitoring requirements. This report will be an integral part of the next ROWD.

E. Certification

All applications, reports, or information submitted to the Regional Board shall be signed and certified pursuant to US EPA regulations at 40 CFR 122.41 (k). Each report shall contain the following completed declaration:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted.

Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for

submitting false information, including the possibility, of a fine and imprisonment for knowing violations.

Executed on the ___ day of _____, 20__.

at _____.

(Signature) _____ (Title) _____";

Permittee submittals to the Principal Permittee shall also be signed and certified pursuant to USEPA regulations 40 CFR 122.41 (k).

The Principal Permittee shall submit the original of each Unified Annual Report to:

INFORMATION TECHNOLOGY
CALIFORNIA REGIONAL WATER QUALITY
CONTROL BOARD - LOS ANGELES REGION
320 W. 4TH STREET, SUITE 200
LOS ANGELES, CA 90013

A copy of the Unified Annual Report shall also be mailed to:

REGIONAL ADMINISTRATOR
ENVIRONMENTAL PROTECTION AGENCY
REGION 9
75 Hawthorne Street
San Francisco, CA 94105

II. Monitoring Program

The primary objectives of the Monitoring Program include, but are not limited to:

- Assessing compliance with this Order;
- Measuring and improving the effectiveness of the SQMPs;
- Assessing the chemical, physical, and biological impacts of receiving waters resulting from urban runoff;
- Characterization of storm water discharges;
- Identifying sources of pollutants; and
- Assessing the overall health and evaluating long-term trends in receiving water quality.

Ultimately, the results of the monitoring requirements outlined below should be used to refine the SQMP for the reduction of pollutant loadings and the protection and enhancement of the beneficial uses of the receiving waters in Los Angeles County.

The Principal Permittee and Permittees shall implement the Monitoring Program as follows:

CORE MONITORING

A. Mass Emissions

The Principal Permittee shall monitor mass emissions to accomplish the following objectives:

- Estimate the mass emissions from the MS4;
 - Assess trends in the mass emissions over time; and
 - Determine if the MS4 is contributing to exceedances of Water Quality Standards by comparing results to applicable standards in the Basin Plan, the Ocean Plan, or the CTR, and with emissions from other dischargers.
1. The Principal Permittee shall monitor mass emissions from the following seven mass emission stations: Ballona Creek, Malibu Creek, Los Angeles River, San Gabriel River, Coyote Creek, Dominguez Channel, and the Santa Clara River. The Principal Permittee shall monitor the first storm event and a minimum of 2 additional storm events for each season. A minimum of two dry weather samples per year at each mass emission station shall also be analyzed. Sampling at all stations shall begin no later than February 1, 2002, except for sampling in the Santa Clara River, which will begin no later than October 15, 2002.
 2. All storms events, in addition to those required above, that result in at least 0.25 inches of rainfall shall be sampled and analyzed for TSS. Results shall be used to assess the variability of storm water constituents and provide a more accurate estimate of mass emissions (pollutant correlation with TSS). This requirement does not apply to manual sampling stations.
 3. Samples for mass emission monitoring may be taken with the same type of automatic sampler used under Order 96-054. Grab samples shall be taken for pathogen indicators and oil and grease. The samplers shall be set to monitor storms that produce 0.25 inches or greater of rainfall.

Samples taken at mass emission stations during the first storm event of the wet season shall be analyzed for all constituents listed in Attachment U-1.

4. Manual samples shall be collected from mass emission stations where it is not feasible to install an automatic sampler (Santa Clara River). Manual samples shall be flow-weighted composites, collected during the first 3 hours, or for the duration of the storm if it is less than 3 hours. A minimum of 3 sample aliquots, separated by a minimum of 15 minutes, shall be taken within each hour of discharge¹, unless the Regional Board Executive Officer approves an alternate protocol.
5. Samples from mass emission stations shall be analyzed for all constituents listed in Attachment U-1. If a constituent is not detected at the method detection limit for its respective test method listed in Attachment U-1 in more than 75 percent of the first 48 sampling events, it need not be further analyzed unless the observed occurrences show concentrations greater than state water quality standards. The Principal Permittee will also conduct annual confirmation sampling for non-detected constituents during the first storm of the wet season every year at each station.
6. The Principal Permittee shall perform an annual analysis, to be included in the Monitoring Report, of the correlation between pollutants of concern (including but not limited to metals and PAHs) and TSS loadings for the sampling events that are analyzed for the complete list of constituents.

B. Water Column Toxicity Monitoring

The Principal Permittee shall analyze mass emission samples for toxicity to evaluate the extent and causes of toxicity in receiving waters and to modify and utilize the SQMP to implement practices that eliminate or reduce sources of toxicity in storm water.

1. The Principal Permittee shall analyze samples from two storm events (including the first storm of each year) and two dry weather events from each mass emission station for toxicity every year. A minimum of one freshwater and one marine species shall be used for toxicity testing for each station event. Specifically, *Ceriodaphnia dubia* (water flea) 7-day survival/reproduction and *Strongylocentrotus purpuratus* (sea urchin) fertilization tests shall be used. These tests should include a dilution series (0.5x steps) that ranges from the undiluted sample (or the highest concentration that can be tested within the limitations of the test methods or sample type) to less than or equal to 6% sample.
2. Toxicity Identification Evaluations (TIE)

The Principal Permittee shall begin a Phase I TIE immediately on all samples that are substantially toxic (greater than or equal to 1 Toxic Unit)

¹ Required in 40 CFR 122.21(g)(7)(ii), and described in NPDES Storm Water Sampling Guidance Document EPA 833-B-92-001. Time-weighted samples may be appropriate if flow is measured during sampling.

to either test species.² If a sample is substantially toxic to both species, a TIE shall be performed for both species. The Phase I TIE shall include the following treatments and corresponding blanks:

- a) Baseline toxicity;
- b) Particle removal by centrifugation;
- c) Solid phase extraction of the centrifuged sample using C18 media;
- d) Complexation of metals using ethylenediaminetetraacetic acid (EDTA) addition to the raw sample;
- e) Neutralization of oxidants/metals using sodium thiosulfate addition to the raw sample; and
- f) Inhibition of organo-phosphate (OP) pesticide activation using piperonyl butoxide addition to the raw sample (crustacean toxicity tests only).

3. Toxicity Reduction Evaluations (TRE)

- a) When the same pollutant or class of pollutants is identified through the TIE process as causing at least 50% of the toxic responses in at least 3 samples at a sampling location, a TRE shall be performed for that identified toxic pollutant. TRE development shall be performed by a neutral third party (retained by the Principal Permittee), with input from Permittees and Regional Board staff. The TRE shall include all reasonable steps to identify the source(s) of toxicity and discuss appropriate BMPs to eliminate the causes of toxicity. Once the source of toxicity and appropriate BMPs are identified, the Principal Permittee shall submit the TRE to the Regional Board Executive Officer for approval. At a minimum, it shall include a discussion of the following items:
 - (1) The potential sources of pollutant(s) causing toxicity;
 - (2) A list of municipalities that may have jurisdiction over sources of pollutant(s) causing toxicity;
 - (3) Recommended BMPs to reduce the pollutant(s) causing toxicity;
 - (4) Proposed changes to the SQMP to reduce the pollutant(s) causing toxicity; and
 - (5) Suggested follow-up monitoring to demonstrate that toxicity has been removed.

² Substantial toxicity means the amount of toxicity necessary to successfully conduct a Phase I TIE. Toxic Units are calculated by dividing 100 by the calculated median test response value (e.g., LC50 or EC50). For example, a LC50 of 50% sample equals 2 Toxic Units. Ceriodaphnia TIEs require at least 50% mortality in undiluted sample (1 Toxic Unit) at any time during the 7-day duration of the initial chronic bioassay (SCCWRP).

Monitoring and Reporting Program No. 6948

- b) Since the Phase I TIEs may only identify a broad category of toxicants (e.g., nonpolar organics), additional TIE analyses may be required in order to identify or confirm the identity of the pollutants causing toxicity before the TRE can be completed.
- c) If TRE implementation for a specific pollutant coincides with TMDL implementation for that pollutant, the efforts may be coordinated.
- d) Upon approval by the Regional Board Executive Officer, the Permittee(s) having jurisdiction over sources causing or contributing to toxicity shall implement the recommended BMPs and take all reasonable steps necessary to eliminate toxicity.
- e) The Principal Permittee shall be responsible for the development of a maximum of two TREs per year. If applicable, the Principal Permittee may use the same TRE for the same toxic pollutant or pollutant class in different watersheds. The TRE process shall be coordinated with TMDL development and implementation (i.e. If a TMDL for zinc is being implemented when a TRE for zinc is required, the efforts shall be coordinated to avoid overlap).
- f) The Principal Permittee shall report on the development, implementation, and results for each TRE in the annual Monitoring Report, beginning the year following the identification of each pollutant or pollutant class causing toxicity.

C. Tributary Monitoring

The Principal Permittee shall monitor tributaries to identify sub-watersheds where storm water discharges are causing or contributing to exceedances of Water Quality Standards, and to prioritize drainage and sub-drainage areas that need management actions.

1. The Principal Permittee shall develop and implement a watershed-based tributary monitoring program, in which a minimum of six tributaries per year will be monitored, based on the schedule described below:
 - a) Monitoring station locations will be rotated so that a minimum total of six tributaries will be monitored per year. Each tributary shall be monitored for a minimum period of one year. If no exceedances of applicable water quality standards occur during one year of monitoring at a single tributary station, the Principal Permittee may move that monitoring station to another tributary, subject to the approval of the Regional Board Executive Officer. When an applicable water quality standard is exceeded in three out of four sampling events in a given monitoring year, the Permittees shall initiate a focused effort to identify sources of pollutants within that subwatershed.
 - b) Tributary monitoring shall begin in the Los Angeles River WMA, and shall be rotated to locations in other watersheds as monitoring at each station is complete, as approved by the Regional Board Executive Officer. The Principal Permittee shall include a

description and explanation of each proposed station location and a summary of the prior year's results of the tributary monitoring program in the annual Monitoring Report.

c) Monitoring shall begin at the following tributaries:

- (1) Aliso Creek;
- (2) Bull Creek;
- (3) Arroyo Seco Channel;
- (4) Rio Hondo Channel;
- (5) Burbank West; and
- (6) Verdugo Wash.

2. Tributary monitoring shall begin October 15, 2002.

3. The Principal Permittee shall monitor the first storm event and at least 3 additional storm events during each storm season. At least one dry weather flow per year will also be sampled at each station.

4. Samples shall be flow-weighted composites, collected during the first 3 hours or for the duration of the storm if it is less than 3 hours. Samples may be collected manually or automatically. A minimum of 3 sample aliquots, separated by a minimum of 15 minutes, shall be taken within each hour of discharge³, unless the Regional Board Executive Officer approves an alternate protocol. Samples shall be taken just upstream of the tributary's confluence with the mainstem. Constituents to be analyzed for each location shall include the following:

- a) pH, dissolved oxygen, temperature, conductivity, and total suspended solids;
- b) Indicator bacteria;
- c) All priority pollutants (Attachment U-1) for the first storm of the year;
- d) All constituents for which the water body is impaired downstream of the monitoring station;⁴
- e) All constituents that caused toxicity or exceeded any applicable water quality criteria at the associated mass emission station the previous year (these constituents shall be listed in each Monitoring Report); and
- f) Flow (flow may be estimated using EPA methods⁵ at sites where flow measurement devices are not in place).

³ Required in 40 CFR 122.21(g)(7)(ii), and described in NPDES Storm Water Sampling Guidance Document EPA 833-B-92-001. Time-weighted samples may be appropriate if flow is measured during sampling.

⁴ The 1998 California 303(d) List and TMDL Priority Schedule lists pollutants for which each water body is impaired, www.swrcb.ca.gov/tmdl/docs/303d98.pdf#reg4

⁵ NPDES Storm Water Sampling Guidance Document, EPA 833-B-92-001, July 1992

D. Shoreline Monitoring

The City of Los Angeles shall monitor shoreline stations to evaluate the impacts to coastal receiving waters and the loss of recreational beneficial uses resulting from storm water/urban runoff. This component shall be integrated and coordinated with similar monitoring programs in the region.

1. The City of Los Angeles shall monitor eighteen water quality sampling stations and supplement the monitoring conducted by the County of Los Angeles Department of Health Services at two additional water quality stations along the shoreline of the Pacific Ocean within the Santa Monica Bay to determine compliance with the California's bathing water standards for public beaches and ocean water-contact sport areas⁶, and the related impacts of discharges from storm drains and piers. The shoreline monitoring program shall be implemented as follows:

- a) The eighteen established shoreline water quality stations listed in Attachment U-2 shall be monitored. Station locations may be modified based on recommendations from the Santa Monica Bay Restoration Project Commission (SMBRPSMBRC) and approval from the Regional Board Executive Officer⁷;
- b) The City of Los Angeles shall supplement the weekly sampling done by the Los Angeles Department of Health Services at two additional shoreline monitoring locations, Manhattan Beach at 28th Street (DHS 113) and the Herondo storm drain (DHS 115), to increase sampling frequency at these sites to 5 times per week.
- c) The City of Los Angeles shall evaluate three additional sites, Temescal Canyon (DHS 102), Bel Air Bay Club (DHS 103), and Montana Avenue (DHS 104), for storm water impact and the necessity of increasing monitoring frequency to 5 times per week. The City of Los Angeles shall report its findings to the Regional Board no later than September 16, 2005. The Regional Board Executive Officer will make a final determination regarding sampling frequency at these sites on the basis of the report. If more frequent sampling is required at one or more of these sites by the Regional Board, the City of Los Angeles shall supplement, as necessary, the weekly sampling done by the Los Angeles County Department of Health Services to increase the sampling frequency to 5 times per week until this Order is re-adopted.
- b)d) Three indicator groups shall be tested for using either membrane filtration, multiple tube fermentation, or chromogenic substrate test kits. Monitoring shall include the following types and frequencies of sampling:

Parameter	Units	Sample Frequency
-----------	-------	------------------

⁶ California Department of Health Services, Health and Safety Code §115880 (Assembly Bill 411, Statutes of 1997, Chapter 765

⁷ Station locations were modified based on the recommendations of the SMBRC TAC at its November 23, 2004 meeting on insert date to align the shoreline monitoring program contained herein with that of the Santa Monica Bay Beaches Bacterial TMDLs Coordinated Shoreline Monitoring Plan, April 7, 2004, developed to assess compliance with the requirements of the Bacteria TMDLs for Santa Monica Bay Beaches.

Total coliforms	CFU or MPN/100 ml	6/week (Mon-Sat) ⁸
Fecal coliform ⁹	CFU or MPN/100 ml	6/week (Mon-Sat) ⁶
Enterococcus	CFU or MPN/100 ml	6/week (Mon-Sat) ⁶

- e) Sample frequency shall be either weekly or 5 times per week, depending upon historical shoreline monitoring data. Days not sampled shall be Sundays and Mondays or Tuesdays. Sampling shall be conducted 5 times per week at shoreline monitoring sites with historical water quality that is worse than the reference beach identified in the Santa Monica Bay Beaches Bacteria TMDLs (Resolutions 2002-004 and 2002-022). Systematic weekly sampling shall be conducted at shoreline monitoring sites with historical water quality that is as good as or better than the reference beach.¹⁰
- (1) Sampling shall be conducted 5 times per week at the following sites listed in Attachment U-2: S1, S2, S4, S5, S6, S7, S9, S10, and S16.
- (2) Sampling shall be conducted once per week at the following sites listed in Attachment U-2: S3, S8, S11, S12, S13, S14, S15, S17, and S18.
- e)f) Shoreline monitoring shall occur during daylight hours. Samples may be omitted in the event of hazardous weather;
- e)g) Shoreline monitoring frequencies at certain stations may be modified based on the use of the adjacent beaches and their proximity to storm drains, as recommended by the SMBRP's SMBRC's Technical Advisory Committee and the Los Angeles County Department of Health Services (LA County DHS).
- e)h) Data collected shall be transmitted daily to the LA County DHS. The City of Los Angeles will annually assess the data and submit it to the Principal Permittee for inclusion in the Monitoring Report;
- f)i) When exceedances of public health standards for bacteria occur, the LA County DHS shall take the appropriate action, as described in the Regulations for Public Beaches and Ocean Water-Contact Sports Areas.¹¹
- e)j) The City of Los Angeles will continue to conduct all monitoring, testing, and data transferring actions as part of the Santa Monica Bay Restoration Commission (SMBRPC) Regional Program for the Santa Monica Bay.

⁸ ~~Samples will be collected on Sundays preceding Monday holidays~~

⁹ *Escherichia Coli (E. Coli)* may be substituted for Fecal Coliform if chromogenic substrate test kits are used

¹⁰ As recommended by the SMBRC at its November 23, 2004 meeting, and approved by the Regional Board Executive Officer on insert date.

¹¹ Regulations for Public Beaches and Ocean Water-Contact Sports Areas, Title 17 CCR Group 10, developed in response to Health and Safety Code §115880

E. Trash Monitoring

To assess the quantities of trash in receiving waters after storm events and to identify areas impaired for trash, the Principal Permittee shall conduct visual observations of trash and take a minimum of one photograph at each mass emission station after the first storm event and 3 additional storm events per year.

Monitoring and Reporting Program No. 6948

1. The Principal Permittee and Permittees in the Los Angeles River and Ballona Creek WMAs (listed in Permit Attachment A) shall develop and implement a trash monitoring program for the Los Angeles River and Ballona Creek watersheds no later than October 15, 2002. The monitoring program and schedule shall be consistent with and pursuant to CWC §13267 "Request for Trash Monitoring", issued by the Regional Board on December 21, 2001. For the first two years of monitoring, either of the following formats for monitoring plans may be used:
 - a) For each watershed, the group of Permittees in that watershed will capture and quantify trash from an area no less than 10% of the total land area over which they have jurisdiction. The monitoring areas shall represent 10% of every land use the group of Permittees has jurisdiction over. If storm drain configuration versus land use make the representation of 10% of a land use infeasible, the Permittees can choose areas that represent their land uses as accurately as possible, as long as the extent of the surface being monitored represents 10%. This monitoring shall use full capture devices. During wet weather, all sampling devices will be emptied within 72 hours of every rain event of 0.25 inch or greater. During dry weather, sampling devices will be emptied and analyzed every three months in the absence of precipitation.
 - b) For each watershed, the group of Permittees in that watershed will sample a minimum of ten representative sites for each land use monitored. For each sampling site, a minimum of five catch basins will be fitted with inserts, for a total of not less than 50 catch basin inserts per land use monitored. The existing litter removal practices that the cities implement will remain in place, so that monitoring will evaluate how much trash is washed into the system under current practices. A structural full capture device shall be installed downstream of at least one sampling site for each land use monitored. For this sampling site, all of the catch basins that are upstream of the full capture-monitoring device must be fitted with inserts. This configuration will provide information on the relative effectiveness of the catch basin inserts as opposed to the full capture systems in varying land uses and under varying weather conditions. During wet weather, all sampling devices will be emptied within 72 hours of every rain event of 0.25 inch or greater. During dry weather, sampling devices will be emptied and analyzed every three months in the absence of precipitation.
2. Permittees shall report data in a single unit of measure that is reproducible and measures the amount of trash, irrespective of water content (e.g. compacted volume based on a standardized compaction rate, or dry weight). Permittees may select the unit, but all Permittees must use the same unit of measure.
3. Following the first two years of data collection, Permittees shall conduct compliance monitoring, which involves calculating trash loading as a

running three-year average (estimated total load discharged from 2003-2006, divided by three).

4. All trash collected shall be disposed of in compliance with all applicable State, federal, and local regulations.

REGIONAL MONITORING

The Principal Permittee shall participate on regional monitoring committees to help establish on-going regional programs that address public health concerns, monitor trends in natural resources and nearshore habitats, and assess regional impacts from all pollutant sources. Regional Monitoring participation shall include, but not necessarily be limited to, the efforts described below.

F. Estuary Sampling

The Southern California Coastal Waters Research Project (SCCWRP), in conjunction with the USEPA, the State Board, three Regional Boards, and participating dischargers, has organized an effort to implement a regional monitoring program for the southern California bight. Previous studies (in 1994 and 1998) included microbiology, water quality, sediment chemistry, sediment toxicity testing, benthic infauna, demersal fish, and bioaccumulation. A similar bight-wide monitoring effort is planned to be conducted in 2003. The Principal Permittee shall participate on the Steering Committee for this bight-wide monitoring project, and complete the estuary sampling requirement described below in parallel with this effort.

In addition to participation in the Bight-wide study, the goal of this requirement is to sample estuaries for sediment chemistry, sediment toxicity, and benthic macroinvertebrate community to determine the spatial extent of sediment fate from storm water, and the magnitude of its effects. A map of each estuary which depicts the impacted areas shall be produced. The maps shall provide the information necessary to conduct effective sediment monitoring to determine trends and accumulation, as a future permit requirement.

1. The Principal Permittee shall sample a maximum of 25 sites in each estuary/mouth (Ballona Creek, Malibu Creek, Los Angeles River, San Gabriel River, and Dominguez Channel) once during the permit term. Sediment samples shall be taken at each station by means of a 0.1m² (1.1 ft²) modified Van Veen sediment grab sampler.
2. The Principal Permittee shall also sample a total of 25 sites outside of the direct outfalls to assess cumulative effects.
3. All samples shall be analyzed for the following:
 - a) Sediment Chemistry (priority pollutants)
 - b) Total Organic Carbon (TOC)
 - c) Grain size
 - d) Sediment Toxicity
 - (1) Amphipod survival bioassays shall be conducted on each sediment sample. Toxicity shall be indicated by an amphipod survival rate of 70% or less in a single test.

- (2) Phase I TIEs of interstitial water, using the amphipod test species, shall be conducted for samples from stations identified to be toxic in a single amphipod survival bioassay.
- e) Benthic Macroinvertebrates
- (1) All sediment samples shall be passed through a 1.0mm (0.039 in) screen to retrieve the benthic organisms. Benthic epifauna and infauna shall be analyzed to determine the structure of the benthic community.
 - (2) The Principal Permittee shall identify all organisms to lowest possible taxon.
 - (3) The Principal Permittee shall determine the Total Biomass of:
 - (i) Mollusks;
 - (ii) Echinoderms;
 - (iii) Annelids/polychaetes
 - (iv) Crustaceans; and
 - (v) All other macroinvertebrates.
 - (4) The Principal Permittee shall determine the community structure analysis, including wet weight of each taxonomic group (listed above), number of species, number of individuals per species, total numerical abundance, species abundance per grab, species richness, species diversity, species evenness and dominance, similarity analysis, cluster analyses, or other appropriate multivariate statistical techniques approved by the Regional Board Executive Officer, and the Infaunal Index¹².
4. The Principal Permittee shall create a map of each estuary depicting degraded areas and the spatial distribution of sediment from storm water. In the Integrated Monitoring Report, the Principal Permittee shall suggest appropriate locations for regular sediment monitoring, based on the results of this study.

G. Bioassessment

The Principal Permittee shall continue participation in the Stormwater Monitoring Coalition (SMC), as well as coordinate with the Surface Water Ambient Monitoring Program (SWAMP) being developed by the State Board to complete the bioassessment requirement. The Regional Board anticipates that the SMC will organize an effort to evaluate the biological index approach for southern California and to design a research project for developing an Index of Biological Integrity (IBI) for this region. The SWAMP has begun work on a statewide effort to determine how to identify reference sites with the goal of IBI development.

¹² Benthic Response Index for Assessing Infaunal Communities on the Mainland Shelf of Southern California, the SCCWRP

The purpose of the bioassessment requirement is to detect biological trends in receiving waters and to collect data for the development of an IBI for southern California. The ultimate goals of bioassessment are to assess the biological integrity of receiving waters, to detect biological responses to pollution, and to identify probable causes of impairment not detected by chemical and physical water quality analysis.

1. The Principal Permittee shall coordinate with the SMC and SWAMP to identify the most appropriate locations for bioassessment stations within Los Angeles County.
2. Station selection shall be complete within one year from the date this Order is adopted, and sampling shall begin no later than October of 2003.
3. The Principal Permittee shall monitor a minimum of 20 bioassessment stations in October of each year, beginning in 2003. A minimum of three replicate samples shall be collected at each station during each sampling event.
4. A professional environmental laboratory shall perform all laboratory, quality assurance, and analytical procedures. The Principal Permittee may collect samples when properly trained in CSBP methods. The Principal Permittee shall develop Standard Operation Procedures (SOPs) for the Bioassessment Monitoring Program that describes all procedures and responsible parties. The SOPs must contain step-by-step field, laboratory and data entry procedures, as well as, related QA/QC procedures. There must also be specific information about the bioassessment program including: assessment program description, its organization and the responsibilities of all its personnel; assessment project description and objectives; qualifications of all personnel; and the type of training each member has received. A copy of the SOPs shall be available to the Regional Board Executive Officer upon request.
5. Field sampling must conform to the SOP established for the California Stream Bioassessment Procedure (CSBP) when appropriate. For sampling of aquatic environments where the CSBP is not appropriate (i.e., an estuary or unwadable stream), California Department of Fish and Game and the Regional Board Executive Officer shall be consulted in order to determine the most appropriate protocol to be implemented. Field crews shall be trained on aspects of the protocol and appropriate safety issues. All field data and sample Chain of Custody (COC) forms must be examined for completion and gross errors by the field crews, the receiving laboratory, and the Principal Permittee. These forms shall be available to California Department of Fish and Game or the Regional Board Executive Officer upon request. Field inspections should be planned with random visits and should be performed by the Principal Permittee, if properly trained in CSBP methods, or an independent auditor. These visits should report on all aspects of the field procedure with corrective action occurring immediately.
6. Taxonomic identification laboratories process the biological samples that usually consist of subsampling organisms, enumerating and identifying taxonomic groups and entering the information into an electronic format.

There should be intra-laboratory QA/QC results for subsampling, taxonomic validation and corrective actions. Biological laboratories should also maintain reference collections, vouchered specimens (the Principal Permittee can request return of their sample voucher collections) and remnant collections. Biological laboratories shall participate in an inter-laboratory (external) taxonomic validation program at a recommended level of 20% for the first two years of the program. If there are no substantial QA/QC problems, the level of external validation may be decreased to 10% in year three upon approval from the Regional Board. External QA/QC should be arranged through the California Department of Fish and Game's Aquatic Bioassessment Laboratory in Rancho Cordova.

7. Sampling, laboratory, quality assurance, and analysis procedures shall follow the standardized "Non-point Source Bioassessment Sampling Procedures" for professional bioassessment as set forth in the California Department of Fish and Game California Stream Bioassessment Procedure (CSBP)¹³. The following results and information shall be included in the annual Monitoring Report:
 - a) All physical, chemical and biological data collected in the assessment;
 - b) Photographs and GPS locations of all stations;
 - c) Documentation of quality assurance and control procedures;
 - d) Analysis that shall include calculation of the metrics used in the CSBP;
 - e) Comparison of mean biological and habitat assessment metric values between stations and year-to-year trends;
 - f) Electronic data formatted to the California Department of Fish and Game Aquatic Bioassessment Laboratory for inclusion in the Statewide Access Bioassessment Database; and
 - g) Copies of all QA/QC documents from laboratories.

SPECIAL STUDIES

H. New Development Impacts Study in the Santa Clara Watershed

The Principal Permittee, with support from the City of Santa Clarita, shall monitor tributaries in the Santa Clara watershed to determine impacts from new development and to compare storm water quality between subwatersheds with and without SUSMPs.

1. The Principal Permittee, in cooperation with the City of Santa Clarita, shall select one station that is representative of a subwatershed in which the majority of development has occurred without SUSMP

¹³ California Stream Bioassessment Procedure (Protocol Brief for Biological and Physical/Habitat Assessment in Wadeable Streams), California Department of Fish and Game - Aquatic Bioassessment Laboratory, May 1999. Located at www.dfg.ca.gov/cabw/protocols.html.

implementation, and one station (SUSMP station) in a subwatershed in which the majority of the development has/will include SUSMP implementation. Other inputs to runoff, such as septic systems, in the two subwatersheds should be similar.

2. The Principal Permittee shall coordinate with the City of Santa Clarita and the Regional Board to develop a proposed study design, including a description of the drainage areas to be monitored and sampling locations, no later than August 1, 2002. If appropriate, this study may be conducted in conjunction with the Peak Discharge Impact Study, described below.
3. The Principal Permittee shall monitor the first storm event and at least 2 additional storm events during each storm season. At least one dry weather event per year will also be sampled at each station.
4. Samples shall be flow-weighted composites, collected during the first 3 hours, or for the duration of the storm if it is less than 3 hours. Samples may be collected manually or automatically. A minimum of 3 sample aliquots, separated by a minimum of 15 minutes, shall be taken within each hour of discharge¹⁴, unless the Regional Board Executive Officer approves alternate protocol. Constituents to be analyzed for each location shall include the following:
 - a) pH, dissolved oxygen, temperature, conductivity, chloride, nitrogen, and TSS;
 - b) Metals: aluminum, arsenic, beryllium, cadmium, chromium, copper, iron, lead, mercury, nickel, selenium, silver, and zinc;
 - c) Pathogen Indicators (Coliform);
 - d) PAHs; and
 - e) Flow (flow may be estimated using EPA methods at sites where flow measurement devices are not in place).
5. The Principal Permittee shall submit an analysis of the data, including a description of each subwatershed, year-to-year changes compared to the amount of development that occurred in each, comparisons between stations, and an analysis of SUSMP effectiveness, with the fourth year Monitoring Report.

I. Peak Discharge Impact Study

The Principal Permittee shall conduct a study to evaluate peak flow control and to determine numeric criteria to prevent or minimize erosion of natural stream channels and banks caused by urbanization.¹⁵ The Principal Permittee may partner with the Ventura County Flood Control District to expand the stream erosion study to the Santa Clara River watershed. The study shall begin no later

¹⁴ Required in 40 CFR 122.21(g)(7)(ii), and described in NPDES Storm Water Sampling Guidance Document EPA 833-B-92-001. Time-weighted samples may be appropriate if flow is measured during sampling.

¹⁵ Permit, Part 4.D.2 (Development Planning Program) requires the development of numerical criteria for peak flow control in natural drainage systems.

than August 1, 2002.

J. BMP Effectiveness Study

The Principal Permittee shall conduct or participate in studies to evaluate the effectiveness of structural and treatment control BMPs. The objective of this study shall include the following:

- Monitor the reduction of pollutants of concern in storm water (including, but not limited to: trash, suspended sediment, pathogen indicators, nutrients, heavy metals, and oil and grease) from five or more different types of BMPs that have been properly installed within the year preceding monitoring. Monitoring shall be continued until the effectiveness of the BMP can be determined.
- Evaluate the requirements, feasibility and cost of maintenance for each BMP.
- Develop recommendations for appropriate BMPs for the reduction of pollutants of concern in storm water in Los Angeles County.

The Principal Permittee may participate in the SMBRP's, "Performance Evaluation of Structural BMPs for Storm Water Pollution Control in the Santa Monica Bay Watershed" study to meet this requirement. Participation includes collaboration and fund contribution to cover the scope of the proposed study.

K. Standard Monitoring Provisions

All monitoring activities shall meet the following requirements:

1. Monitoring and Records [40 CFR 122.41(j)(1)]
Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity.
2. Monitoring and Records [40 CFR 122.41(j)(2)] [CWC §13383(a)]
The Principal Permittee and Permittees shall retain records of all monitoring information, including all calibration and maintenance of monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the Report of Waste Discharge and application for this Order, for a period of at least five (5) years from the date of the sample, measurement, report, or application. This period may be extended by request of the Regional Board or USEPA at any time and shall be extended during the course of any unresolved litigation regarding this discharge.
3. Monitoring and Records [40 CFR 122.21(j)(3)]
Records of monitoring information shall include:
 - a) The date, exact place, and time of sampling or measurements;
 - b) The individual(s) who performed the sampling or measurements;
 - c) The date(s) analyses were performed;

Monitoring and Reporting Program No. 6948

- d) The individual(s) who performed the analyses;
 - e) The analytical techniques or methods used; and,
 - f) The results of such analyses.
4. Monitoring and Records [40 CFR 122.21(j)(4)]

All sampling, sample preservation, and analyses must be conducted according to test procedures under 40 CFR Part 136, unless other test procedures have been specified in this Order.
 5. Monitoring and Records [40 CFR 122.21(j)(5)]

The CWA provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this Order shall, upon conviction, be punished by a fine of not more than \$10,000, or by imprisonment for not more than two years, or both. If a conviction of a person is for a violation committed after a first conviction of such person under this paragraph, punishment is a fine of not more than \$20,000 per day of violation, or by imprisonment of not more than four years, or both.
 6. All chemical, bacteriological, and toxicity analyses shall be conducted at a laboratory certified for such analyses by an appropriate governmental regulatory agency.
 7. For priority toxic pollutants that are identified in the CTR (65 *Fed. Reg.* 31682), the MLs published in Appendix 4 of the SIP shall be used for all analyses, unless otherwise specified. The MLs from the SIP are incorporated into the Constituent List (Attachment U-1).
 8. The Monitoring Report shall specify the analytical method used, the MDL and the ML for each pollutant. For the purpose of reporting compliance with numerical limitations, performance goals, and receiving water limitations, analytical data shall be reported with one of the following methods, as appropriate:
 - a) An actual numerical value for sample results greater than or equal to the ML;
 - b) "Not-detected (ND)" for sample results less than the laboratory's MDL with the MDL indicated for the analytical method used; or
 - c) "Detected, but Not Quantified (DNQ)" if results are greater than or equal to the laboratory's MDL but less than the ML. The estimated chemical concentration of the sample shall also be reported. This is the concentration that results from the confirmed detection of the substance by the analytical method below the ML value.
 9. For priority toxic pollutants, if the Principal Permittee or Permittee can demonstrate that a particular ML is not attainable, in accordance with procedures set forth in 40 CFR 136, the lowest quantifiable concentration of the lowest calibration standard analyzed by a specific analytical procedure (assuming that all the method specified sample weights, volumes, and processing steps have been followed) may be used instead

of the ML listed in Appendix 4 of the SIP. The Principal Permittee must submit documentation from the laboratory to the Regional Board Executive Officer for approval prior to raising the ML for any constituent.

10. Monitoring Reports [40 CFR 122.41(l)(4)(ii)]
If the Principal Permittee monitors any pollutant more frequently than required by the permit using test procedures approved under 40 CFR part 136, unless otherwise specified in the Order, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the annual Monitoring Reports.
11. Monitoring Reports [40 CFR 122.41(l)(4)(iii)]
Calculations for all limitations which require averaging of measurements shall utilize an arithmetic mean unless otherwise specified in this Order.
12. If no flow occurred during the reporting period, the Monitoring Report shall so state.
13. The Regional Board Executive Officer or the Regional Board, consistent with 40 CFR 122.41, may approve changes to the Monitoring Program, after providing the opportunity for public comment, either:
 - a) By petition of the Principal Permittee or by petition of interested parties after the submittal of the annual Monitoring Report. Such petition shall be filed not later than 60 days after the Monitoring Report submittal date, or
 - b) As deemed necessary by the Regional Board Executive Officer following notice to the Principal Permittee.

Ordered by:

Dennis A. Dickerson
Executive Officer
Date: December 13, 2001

Changes approved by:

Jonathan Bishop
Executive Officer
Date: June 15, 2005

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

This form summarizes the requirements in Order No. 01-182. Each Permittee must complete this form in its entirety, except for those requirements applicable only to the Principal Permittee. Only report activities that were performed during the previous fiscal year. Upon completion, this form shall be submitted to the Principal Permittee, by the date specified by the Principal Permittee, for inclusion in the unified Annual Storm Water Program Report. Attachments should be included where necessary to provide sufficient information on program implementation.

The goals of this Report are to: 1) concisely document implementation of the Storm Water Quality Management Program (SQMP) during the past fiscal year; 2) evaluate program results for continuous improvement; 3) to determine compliance with Order 01-182; and 4) to share this information with other Permittees, municipal decision makers, and the public.

!	YOU MUST FILL OUT ALL THE INFORMATION REQUESTED <i>Do not leave any of the sections blank.</i>
N/A	If the question does not apply to your municipality, please indicate N/A in the space provided and provide a brief explanation
U	If the information requested is currently unavailable, please indicate U in the space provided and give a brief explanation.

This Report Form consists of the following sections:

SECTION	PAGE
I. Program Management	2-4
II. Receiving Water Limitations	5
III. SQMP Implementation	5-7
IV. Special Provisions	8
IV.A. Public Information and Participation Program	8-14
IV.B. Industrial/Commercial Facilities Program	15-17
IV.C. Development Planning Program	18-21
IV.D. Development Construction Program	22-23
IV.E. Public Agency Activities Program	24-33
IV.F. IC/ID Elimination Program	34-37
V. Monitoring	38
VI. Assessment of Program Effectiveness	38

Los Angeles County Municipal Storm Water Permit (Order 01-182)

Individual Annual Report Form

Attachment U-4

Reporting Year 200__ - 200__

I. Program Management

A. Permittee Name: _____

B. Permittee Program Supervisor: _____

Title:

Address:

City:

Zip Code:

Phone:

Fax:

C. In the space below, briefly describe how the storm water program is coordinated within your agency's departments and divisions. Include a description of any problems with coordination between departments. To facilitate this, complete the Table 1.

TABLE 1 - Program Management

Storm Water Management Activity	Division/Department	# of Individuals Responsible for Implementing
1. Outreach & Education		
2. Industrial/Commercial Inspections		
3. Construction Permits/Inspections		
4. IC/ID Inspections		
5. Street sweeping		
6. Catch Basin Cleaning		
7. Spill Response		
8. Development Planning (project/SUSMP review and approval)		
9. Trash Collection		

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

D. Staff and Training

Attach a summary of staff training over the last fiscal year. This shall include the staff name, department, type of training, and date of training.

E. Budget Summary

1. Does your municipality have a storm water utility? Yes No
If no, describe the funding source(s) used to implement the requirements of Order No. 01-182.

2. Are the existing financial resources sufficient to accomplish all required activities? Yes No
3. Complete Table 2 to the extent that accurate information is available (indicate U in the spaces where the information is unavailable), and report any supplemental dedicated budgets for the same categories on the lines below the table.
4. List any additional state/federally funded projects related to storm water.

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

TABLE 2

Program Element	Expenditures in Previous Fiscal Year	Estimated Amount Needed to implement Order 01-182
1. Program management a. Administrative costs b. Capital costs		
2. Public Information and Participation a. Public Outreach/Education b. Employee Training c. Corporate Outreach d. Business Assistance		
3. Industrial/Commercial inspection/ site visit activities		
4. Development Planning		
5. Development Construction a. Construction inspections		
6. Public Agency Activities a. Maintenance of structural and treatment control BMPs b. Municipal street sweeping c. Catch basin cleaning d. Trash collection/recycling e. Capital costs f. Other		
7. IC/ID Program a. Operations and Maintenance b. Capitol Costs		
8. Monitoring		
9. Other		
10. TOTAL		

List any supplemental dedicated budgets for the above categories:

List any activities that have been contracted out to consultants/other agencies:

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

II. Receiving Water Limitations (Part 2)

- A. Are you aware, or have you been notified, of any discharges from your MS4 that cause or contribute to a condition of nuisance or to the violation of any applicable water quality standards? Yes No

- B. Has the Regional Board notified you that discharges from your MS4 are causing or contributing to an exceedance of water quality standards? Yes No

- C. If you answered Yes to either of the above questions, you must attach a Receiving Water Limitations (RWL) Compliance Report. The Report must include the following:
 - 1. A description of the pollutants that are in exceedance and an analysis of possible sources;
 - 2. A plan to comply with the RWL (Permit, Part 2);
 - 3. Changes to the SQMP to eliminate water quality exceedances;
 - 4. Enhanced monitoring to demonstrate compliance; and
 - 5. Results of implementation.

III. SQMP Implementation (Part 3)

- A. Has your agency implemented the SQMP and any additional controls necessary to reduce the discharges of pollutants in storm water to the maximum extent practicable? Yes No

- B. If your agency has implemented additional or different controls than described in the countywide SQMP, has your agency developed a local SQMP that reflects the conditions in its jurisdiction and specifies activities being implemented under the appropriate elements described in the countywide SQMP? Yes No

- C. Describe the status of developing a local SQMP in the box below.

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

- D. If applicable, describe an additional BMP, in addition to those in the countywide SQMP, that your city has implemented to reduce pollutants in storm water to the maximum extent practicable.

- E. Watershed Management Committees (WMCs)

- 1. Which WMC are you in?
- 2. Who is your designated representative to the WMC?
- 3. How many WMC meetings did you participate in last year?
- 4. Describe specific improvements to your storm water management program as a result of WMC meetings.

- 5. Attach any comments or suggestions regarding your WMC.

- F. Storm Water Ordinance

- 1. Have you adopted a storm water and urban runoff ordinance to enforce all requirements of Order 01-182? Yes No
If not, describe the status of adopting such an ordinance.

- 2. If yes, have you already submitted a copy of the ordinance to the Regional Board? Yes No
If not, please attach a copy to this Report.

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

3. Were any amendments made to your storm water ordinance during the last fiscal year? Yes No
If yes, attach a copy of amendments to this Report.

G. Discharge Prohibitions

1. List any non-storm water discharges you feel should be further regulated:

2. List any non-storm water discharges you feel should be exempt, and provide an explanation for each:

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

IV. Special Provisions (Part 4)

A. Public Information and Participation (Part 4.B)

In addition to answering the following questions, attach a summary of all storm water education activities that your agency conducted or participated in last year.

1. No Dumping Message

- a) How many storm drain inlets does your agency own?
- b) How many storm drain inlets were marked with a no dumping message in the last fiscal year?
- c) What is the total number of storm drain inlets that are legibly marked with a no dumping message?

If this number is less than the number in question 1.b, describe why all inlets have not been marked, the process used to implement this requirement, and the expected completion date.

- d) How many public access points to creeks, channels, and other water bodies within your jurisdiction have been posted with no dumping signage in the past year?

Describe your agency's status of implementing this requirement by the date required in Order No. 01-182.

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

2. Reporting Hotline

- a) Has your agency established its own hotline for reporting and for general storm water management information? Yes No
- b) If so, what is the number?
- c) Is this information listed in the government pages of the telephone book? Yes No
- d) If no, is your agency coordinated with the countywide hotline? Yes No
- e) Do you keep record of the number of calls received and how they were responded to? Yes No
- f) How many calls were received in the last fiscal year?
- g) Describe the process used to respond to hotline calls.
- h) Have you provided the Principal Permittee with your current reporting contact information? Yes No
- i) Have you compiled a list of the general public reporting contacts for all Permittees and posted it on the www.888CleanLA.com web site (Principal Permittee only)? Yes No
If not, when is this scheduled to occur?

3. Outreach and Education

- a) Describe the strategy developed to provide outreach and bilingual materials to target ethnic communities. Include an explanation of why each community was chosen as a target, how program effectiveness will be determined, and status of implementation. (Principal Permittee only)

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

- b) Did the Principal Permittee organize quarterly Public Outreach Strategy meetings that you were aware of? Yes No

How many Public Outreach Strategy meetings did your agency participate in last year?

Explain why your agency did not attend any or all of the organized meetings.

Identify specific improvements to your storm water education program as a result of these meetings:

List suggestions to increase the usefulness of quarterly meetings:

If quarterly Public Outreach Strategy meetings were not organized, explain why not and when this requirement will be implemented (*Principal Permittee only*).

- c) Approximately how many impressions were made last year on the general public about storm water quality via print, local TV, local radio, or other media?

- d) Describe efforts your agency made to educate local schools on storm water pollution.

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

- e) Did you provide all schools within each school district in Los Angeles County with materials necessary to educate a minimum of 50 percent of all school children (K-12) every 2 years on storm water pollution (*Principal Permittee only*)? Yes No
If not, explain why.

- f) Describe the strategy developed to measure the effectiveness of in-school educational programs, including assessing students' knowledge of storm water pollution problems and solutions before and after educational efforts (*Principal Permittee only*).

For Permit Years 2-5, attach an assessment of the effectiveness of in-school storm water education programs.

- g) What is the behavioral change target that was developed based on sociological data and other studies (*Principal Permittee only*)?

If no target has been developed, explain why and describe the status of developing a target.

What is the status of meeting the target by the end of Year 5?

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

4. Pollutant-Specific Outreach

- a) Attach a description of each watershed-specific outreach program that your agency developed (*Principal Permittee only*). All pollutants listed in Table 1 (Section B.1.d.) must be included.
- b) Did your agency cooperate with the Principal Permittee to develop specific outreach programs to target pollutants in your area? Yes No
- c) Did your agency help distribute pollutant-specific materials in your city? Yes No
- d) Describe how your agency has made outreach material available to the general public, schools, community groups, contractors and developers, etc...

5. Businesses Program

- a) Briefly describe the Corporate Outreach Program that has been developed to target gas stations and restaurant chains (*Principal Permittee only*).

- b) How many corporate managers did your agency (*Principal Permittee only*) reach last year?
- c) What is the total number of corporations to be reached through this program (*Principal Permittee only*)?
- d) Is your agency meeting the requirement of reaching all gas station and restaurant corporations once every two years (*Principal Permittee only*)? Yes No
If not, describe measures that will be taken to fully implement this requirement.

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

- e) Has your agency developed and/or implemented a Business Assistance Program? Yes No
If so, briefly describe your agency's program, including the number of businesses assisted, the type of assistance, and an assessment of the program's effectiveness.

- 6. Did you encourage local radio stations and newspapers to use public service announcements? Yes No
How many media outlets were contacted?
Which newspapers or radio stations ran them?

Who was the audience?

- 7. Did you supplement the County's media purchase by funding additional media buys? Yes No
Estimated dollar value/in-kind contribution:
Type of media purchased:
Frequency of the buys:
Did another agency help with the purchase? Yes No

- 8. Did you work with local business, the County, or other Permittees to place non-traditional advertising? Yes No
If so, describe the type of advertising.

- 9. Did you establish local community partnerships to distribute educational storm water pollution prevention material? Yes No
Describe the materials that were distributed:

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

Who were the key partners?

Who was the audience (businesses, schools, etc.)?

10. Did you participate in or publicize workshops or community events to discuss storm water pollution? Yes No
How many events did you attend?

11. Does your agency have a website that provides storm water pollution prevention information? Yes No
If so, what is the address?

12. Has awareness increased in your community regarding storm water pollution? Yes No
Do you feel that behaviors have changed? Yes No
Explain the basis for your answers. Include a description of any evaluation methods that are used to determine the effectiveness of your agency's outreach.

13. How would you modify the storm water public education program to improve it on the City or County level?

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form**

Attachment U-4

B. Industrial/Commercial Facilities Program

1. Critical Source Inventory Database

Did you (individually or jointly) update the Database for Critical Sources Inventory? Yes No

Comments/Explanation/Conclusion:

2. Inspection Program

Provide the reporting data as suggested in the following tables.

Category	Initial Number of Facilities at the start of cycle proposed for inspection by categories (after the initial year, the updated number based on the new data)	Number of facilities inspected in the current reporting year	% Completed at the time of this report for present cycle (from the initial value, and from the updated value after first cycle)	Total number since permit adoption
Landfills				
TSDF				
...				

Comments/Explanation/Conclusion:

3. BMPs Implementation

Provide the reporting data as suggested in the following table.

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form**

Attachment U-4

Category	Number of facilities inspected by category in this reporting year	Number of facilities identified as adequately implementing BMPs as specified in this reporting year	% adequately implementing out of total in this reporting year	Number of facilities required to implement or upgrade in this reporting year	Number of facilities inspected by category in this reporting cycle	Number of facilities identified as adequately implementing BMPs as specified in this reporting cycle	% adequately implementing out of total in this reporting cycle	Number of facilities required to implement or upgrade in this reporting cycle	Total Number during this permit adequately implementing	Total Number during this permit required to implement or upgrade
Landfills										
...										

Comments/Explanation/Conclusion:

4. Enforcement Activities

Provide the reporting data as suggested in the following tables.

Enforcement Actions by categories (e.g. Warning letter, NOV, referral to D.A., etc.)	Number of facilities issued enforcement actions in the current reporting year	Number of facilities issued enforcement actions in the current reporting cycle	Number of facilities (re)inspected due to enforcement actions in current reporting year	Number of facilities (re)inspected due to enforcement actions in current reporting cycle	Number of facilities brought into compliance in the current reporting year	Number of facilities brought into compliance in current reporting cycle	Total number of enforcement actions since permit adoption (by category)

Facilities by category	Number of Warning letters	Number of NOVs	Number of Referral	Number of Other

Comments/Explanation/Conclusion:

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form**

Attachment U-4

5. Program Implementation Effectiveness Assessment

Please give a brief assessment of the implementation of the program in removing pollutants from the storm water discharges. Please provide an explanation. Suggested improvements or adjustments based on the knowledge gained through this reporting period activities must be reflected in a change in the SQMP, if warranted.

Highly Effective

Somewhat Effective

Non-effective

Comments/Explanation/Conclusion:

6. You must also submit a quarterly electronic submittal of your Industrial/Commercial Facilities Program activities.

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

C. Development Planning Program (Part 4.D)

1. Does your agency have a process to minimize impacts from storm water and urban runoff on the biological integrity of natural drainage systems and water bodies in accordance with requirements under CEQA, Section 404 of the CWA, local ordinances, and other legal authorities? Yes No

Attach examples showing how storm water quality impacts were addressed in environmental documents for projects over the past year.

2. Does your agency have procedures to include the following requirements in all priority development and redevelopment projects:

- a) Maximize the percentage of permeable surfaces to allow more percolation of storm water into the ground? Yes No

- b) Minimize the quantity of storm water directed to impermeable surfaces and the MS4? Yes No

- c) Minimize pollution emanating from parking lots through the use of appropriate treatment control BMPs and good housekeeping practices? Yes No

- d) Provide for appropriate permanent measures to reduce storm water pollutant loads from the development site? Yes No

3. List the types and numbers of BMPs that your agency required for priority projects to meet the requirements described above.

4. Describe the status of the development or implementation of peak flow controls in Natural Drainage Systems.

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

5. Has your agency amended codes and/or ordinances to give legal effect to the SUSMP changes required in the Permit? Yes No

6. Describe the process your agency uses to include SUSMP design standards in new development and redevelopment project approvals.

7. How many of each of the following projects did your agency review and condition to meet SUSMP requirements last year?

- a) Residential
- b) Commercial
- c) Industrial
- d) Automotive Service Facilities
- e) Retail Gasoline Outlets
- f) Restaurants
- g) Parking Lots
- h) Projects located in or directly adjacent to or discharging directly to an environmentally sensitive area
- i) Total number of permits issued to priority projects

8. What is the percentage of total development projects that were conditioned to meet SUSMP requirements? %

9. How has your agency prepared to reduce the SUSMP threshold for industrial/commercial facilities to 1 acre from 100,000 square feet in 2003?

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

- 10. After 2003, how many additional projects per year will require/did require implementation of SUSMP requirements as a result of the lower threshold?

- 11. Does your agency participate in an approved regional or sub-regional storm water mitigation program to substitute in part or wholly SUSMP requirements for new development? Yes No

- 12. Has your agency modified its planning procedures for preparing and reviewing CEQA documents to consider potential storm water quality impacts and provide for appropriate mitigation? Yes No

If no, provide an explanation and an expected date of completion.

- 13. Did your agency update any of the following General Plan elements in the past year?
 - a) Land Use Yes No
 - b) Housing Yes No
 - c) Conservation Yes No
 - d) Open Space Yes No

If yes, please describe how watershed and storm water quality and quantity management considerations were included.

Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4

- 14. How many targeted staff were trained last year?
- 15. How many targeted staff are trained annually?
- 16. What percentage of total staff are trained annually? %
- 17. Has your agency developed and made available development planning guidelines? Yes No
- 18. If no, what is the expected date that guidelines will be developed and available to developers?
- 19. What is the status of completion of the technical manual for siting and design of BMPs for the development community?

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

D. Development Construction Program

1. Describe your agency's program to control runoff from construction activity at all construction sites within its jurisdiction.

2. Does your agency require the preparation, submittal, and implementation of a Local Storm Water Pollution Prevention Plan (Local SWPPP) prior to the issuance of a grading permit for all sites that meet one or all of the following criteria?

a) Will result in soil disturbance of one acre or greater Yes No

b) Is within, directly adjacent to, or is discharging directly to an environmentally sensitive area Yes No

c) Is located in a hillside area Yes No

3. Attach one example of a local SWPPP
4. Describe the process your agency uses to require proof of filing a Notice of Intent for coverage under the State General Construction Activity Storm Water permit and a certification that a SWPPP has been prepared prior to issuing a grading permit?

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

5. How many building/grading permits were issued to sites requiring Local SWPPPs last year?
6. How many building/grading permits were issued to sites requiring coverage under the General Construction Activities Storm Water Permit last year?
7. How many building/grading permits were issued to construction site less than one acre in size last year?
8. How many construction sites were inspected during the last wet season?
9. Complete the table below.

Type of Violation	# of Violations	% of Total Inspections	# of Follow-up Inspections	# of Enforcement Actions
Off-site discharge of sediment				
Off-site discharge of other pollutants				
No or inadequate SWPPP				
Inadequate BMP/SWPPP implementation				

10. Describe the process for taking enforcement actions against construction site violations, including the types of actions that are taken.

11. Describe the system that your agency uses to track the issuance of grading permits.

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

E. Public Agency Activities (Part 4.F)

1. Sewage System Maintenance, Overflow, and Spill Prevention
(only applicable to agencies that own and/or operate a sanitary sewer system)

- a) Has your agency developed and implemented a response plan for sanitary sewer overflows that includes the requirements in Order 01-182? Yes No
- b) How many sanitary sewer overflows occurred within your jurisdiction?
- c) How many did your agency respond to?
- d) Did your agency investigate all complaints received? Yes No
- e) How many complaints were received?
- f) Upon notification, did your agency immediately respond to overflows by containment? Yes No
- g) Did your agency notify appropriate sewer and public health agencies when a sewer overflowed to the MS4? Yes No
- h) Did your agency implement a program to prevent sewage spills or leaks from sewage facilities from entering the MS4? Yes No

If so, describe the program:

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

- i) Did your agency implement a program to identify, repair, and remediate sanitary sewer blockages, exfiltration, overflow, and wet weather overflows from sanitary sewers to the MS4? Yes No
If so, describe the program:

2. Public Construction Activities Management

- a) What percentage of public construction sites 5 acres or greater in size did your agency obtain coverage under the State of California General Construction Activities Storm Water Discharge Permit ? %
- b) Give an explanation for any sites greater than 5 acres that were not covered:

- c) What is the total number of active public construction sites?
How many were 5 acres or greater in size?

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

- d) (After March, 2003) Did your agency obtain coverage under the State of California General Construction Activities Storm Water Discharge Permit coverage for public construction sites for sites one acre or greater? Yes No

3. Vehicle Maintenance/Material Storage Facilities/Corporation Yards Management

- a) Did your agency implement pollution prevention plans for each public vehicle maintenance facility, material storage facility, and corporation yard? Yes No

- b) Briefly describe how your agency implements the following, and any additional, BMPs to minimize pollutant discharges in storm water:

- (1) Good housekeeping practices
- (2) Material storage control
- (3) Vehicle leaks and spill control
- (4) Illicit discharge control

- c) Are all Permittee owned and/or operated vehicle/equipment wash areas self-contained, covered, equipped with a clarifier, and properly connected to the sanitary sewer? Yes No
If not, what is the status of implementing this requirement?

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

d) How many Permittee owned and/or operated vehicle/equipment wash areas are scheduled to be redeveloped to include the BMPs listed above?

4. Landscape and Recreational Facilities Management

a) Has your agency developed a standardized protocol for the routine and non-routine application of pesticides, herbicides (including pre-emergents), and fertilizers?

Yes No

Briefly describe this protocol:

b) How does your agency ensure that there is no application of pesticides or fertilizers immediately before, during, or immediately after a rain event or when water is flowing off the area to be applied?

c) Are any banned pesticides, herbicides, fungicides, or rodenticides stored or applied in your agency's jurisdiction that you know of?

Yes No

If so, list them:

Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4

- d) What percentage of your agency's staff that apply pesticides are certified by the California Department of Food and Agriculture, or are under the direct supervision of a certified pesticide applicator?
- e) Describe procedures your agency has implemented to encourage retention and planting of native vegetation and to reduce water, fertilizer, and pesticide needs:

5. Storm Drain Operation and Management

- a) Did your agency designate catch basin inlets within its jurisdiction as Priority A; Priority B; and Priority C? Yes No
- b) How many of each designation exist in your jurisdiction?
 Priority A:
 Priority B:
 Priority C:
- c) Is your city subject to a trash TMDL? Yes No
- d) If yes, describe the activities and/or implementation measures that your agency conducted pursuant to the TMDL and any other trash reduction efforts that occurred.

Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4

- e) How many times were all Priority A basins cleaned last year?
- f) How many times were all Priority B basins cleaned last year?
- g) How many times were all Priority C basins cleaned last year?
- h) How much total waste was collected in tons from catch basin clean-outs last year?
- i) Attach a record of all catch basins in your jurisdiction. This shall identify each basin as City or County owned, and Priority A, B, or C. For all basins that are owned and operated by your agency, include dates that each was cleaned out over the past year.
- j) Did your agency place and maintain trash receptacles at all transit stops within its jurisdiction. Yes No
- k) How many new trash receptacles were installed last year?
- l) Did your agency place special conditions for events that generated substantial quantities of trash and litter including provisions that:
- (1) Provide for the proper management of trash and litter generated from the event? Yes No
- (2) Arrange for temporary screens to be placed on catch basins? Yes No
- (3) Or for catch basins in that area to be cleaned out subsequent to the event and prior to any rain? Yes No
- m) Did your agency inspect the legibility of the catch basin stencil or labels? Yes No
What percentage of stencils were legible?

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

n) Were illegible stencils recorded and re-stenciled or re-labeled within 180 days of inspection? Yes No

o) Did your agency visually monitor Permittee-owned open channel storm drains and other drainage structures for debris at least annually and identify and prioritize problem areas of illicit discharge for regular inspection? Yes No
Is the prioritization attached? Yes No

p) Did your agency review its maintenance activities to assure that appropriate storm water BMPs are being utilized to protect water quality? Yes No
What changes have been made?

q) Did your agency remove trash and debris from open channel storm drains a minimum of once per year before the storm season? Yes No

r) How did your agency minimize the discharge of contaminants during MS4 maintenance and clean outs?

s) Where is removed material disposed of?

Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4

6. Streets and Roads Maintenance

- a) Did your agency designate streets and/or street segments within its jurisdiction as one of the following:
- (1) Priority A – streets and/or street segments that are designated as consistently generating the highest volumes of trash and/or litter? Yes No
 - (2) Priority B - streets and/or street segments that are designated as consistently generating moderate volumes of trash and/or litter? Yes No
 - (3) Priority C – streets and/or street segments that are designated as generating low volumes of trash and/or litter? Yes No
- b) Did your agency perform all street sweeping in compliance with the permit and according to the following schedule:
- (1) Priority A – These streets and/or street segments shall be swept at least two times per month? Yes No
 - (2) Priority B - Each Permittee shall ensure that each streets and/or street segments is cleaned at least once per month? Yes No
 - (3) Priority C – These streets and/or street segments shall be cleaned as necessary but in no case less than once per year? Yes No

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

- c) Did your agency require that saw cutting wastes be recovered and disposed of properly and that in no case shall waste be left on a roadway or allowed to enter the storm drain? Yes No
- d) Did your agency require that concrete and other street and road maintenance materials and wastes be managed to prevent pollutant discharges? Yes No
- e) Did your agency require that the washout of concrete trucks and chutes only occur in designated areas and never into storm drains, open ditches, streets, or catch basins leading to the storm drain system? Yes No
- f) Did your agency train its employees in targeted positions (whose interactions, jobs, and activities affect storm water quality) regarding the requirements of the storm water management program to:
 - (1) Promote a clear understanding of the potential for maintenance activities to pollute storm water? and Yes No
 - (2) Identify and select appropriate BMPs? Yes No

7. Parking Facilities Management

- a) Did your agency ensure that Permittee-owned parking lots be kept clear of debris and excessive oil buildup and cleaned no less than 2 times per month and/or inspected no less than 2 times per month to determine if cleaning is necessary. Yes No
- b) Were any Permittee-owned parking lots cleaned less than once a month? How many? Yes No

Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4

8. Public Industrial Activities Management
- a) Did your agency, for all municipal activity considered an industrial activity under USEPA Phase I storm water regulations, obtain separate coverage under the State of California General Industrial Activities Storm Water Discharge Permit no later than December 31, 2001? Yes No
- b) Does your agency serve a population of less than 100,000 people? Yes No
9. Emergency Procedures
- a) In case of real emergencies, did your agency repair essential public services and infrastructure in a manner to minimize environmental damage? Yes No
- b) Were BMPs implemented to the extent that measures did not compromise public health and safety? Yes No
10. Feasibility Study
- a) Did your agency cooperate with the County Sanitation Districts of Los Angeles County to prepare a study which investigates the possible diversion of dry weather flows or the use of alternative treatment control BMPs? Yes No
- b) Did your agency review its individual prioritized list and create a watershed based priority list of drains for potential diversion and submit a listing of priority diversions to the Regional Board Executive Officer? Yes No

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

F. Illicit Connections and Illicit Discharges (IC/ID) Elimination Program (Part 4.G)

1. Attach a copy of your agency's IC/ID Elimination Implementation Program (Part 4.G.1.a).
2. Attach a map of your storm drain system showing all permitted connections (if available), and the locations of all illicit connections and discharges that occurred last year (Part 4.G.1.b). If your agency has not completed this requirement, describe the status of the development of a baseline map, including an expected completion date.

3. Describe your enforcement procedures for eliminating illicit discharges and terminating illicit connections.

4. Describe your record keeping system to document all illicit connections and discharges.

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

- 5. What is the total length of open channel that your agency owns and operates?
- 6. What length was screened last year for illicit connections?
- 7. What is the total length of closed storm drain that your agency owns and operates?
- 8. What length was screened last year for illicit connections?
- 9. Describe the method used to screen your storm drains.

- 10. Provide the reporting data for illicit connections as suggested in the following table (you may submit a spreadsheet from your database that contains the information).

Year	Total # reported/ identified	Total # investigated	# that conveyed exempt discharges or NPDES permitted	# that conveyed illicit discharges that were terminated	# that were removed	# that resulted in enforcement action	# that resulted in <i>other</i> actions
01/02							
02/03							
03/04							
04/05							
05/06							

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

11. Explain any *other* actions that occurred in the last year.

12. What is the average time it takes your agency to initiate an illicit connection investigation after it is reported?

a) Were all identified connections terminated within 180 days? Yes No

b) If not, explain why.

13. Provide the reporting data for illicit discharges as suggested in the following table (you may submit a spreadsheet from you database that contains this information).

Year	Total # reported	Total # that were discontinued/ cleaned up voluntarily through enforcement and the source was identified	# that were cleaned up but the source could not be identified	# that resulted in no evidence of discharge	# that were determined to be conditionally exempt	# that were exempt or in compliance and the source identified	# that resulted in enforcement action
01/02							
02/03							
03/04							
04/05							
05/06							

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

14. What is the average response time after an illicit discharge is reported?

a) Did any response times exceed 72 hours? Yes No

b) If yes, explain why.

15. Describe the your agency's spill response procedures.

16. What would you do differently to improve your agency's IC/ID Elimination Program?

17. Attach a list of all permitted connections to your storm sewer system.

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

V. Monitoring

Briefly describe any storm water monitoring activities that are not required by Order No. 01-182 that your municipality conducted, participated in, or received funding to conduct in the past fiscal year. These activities should correspond with the dollar amount you listed in Table 2.

VI. Assessment of Program Effectiveness

- A. Attach a summary of the effectiveness of your storm water management program. This summary should include, at a minimum, the following:
1. An assessment of your agency's compliance with permit requirements, based on your responses to the questions in this form;
 2. Descriptions of any evaluation methods that your agency uses to determine the effectiveness of your storm water management program;
 3. A summary of the strengths and weaknesses of your agency's storm water management program;
 4. A list of specific program highlights and accomplishments;
 5. A description of water quality improvements or degradation in your watershed over the past fiscal year;
 6. Interagency coordination between cities to improve the storm water management program;
 7. Future plans to improve your agency's storm water management program; and
 8. Suggestions to improve the effectiveness of your program or the County model programs.
- B. On a scale of 1 to 10 (10 being full implementation of requirements by their deadlines), rate your municipality's level of compliance with Order No. 01-182.
- C. List any suggestions your agency has for improving program reporting and assessment.

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

VII. Certification Statement

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted.

Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility, of a fine and imprisonment for knowing violations.

Executed on the ___ day of _____, 20_.

at _____.

Printed Name _____ Title _____

(Signature) _____

Signature by duly authorized representative

ATTACHMENT H-5

This form summarizes the requirements in Order No. 01-182. Each Permittee must complete this form in its entirety, except for those requirements applicable only to the Principal Permittee. Only report activities that were performed during the previous fiscal year. Upon completion, this form shall be submitted to the Principal Permittee, by the date specified by the Principal Permittee, for inclusion in the unified Annual Storm Water Program Report. Attachments should be included where necessary to provide sufficient information on program implementation.

The goals of this Report are to: 1) concisely document implementation of the Storm Water Quality Management Program (SQMP) during the past fiscal year; 2) evaluate program results for continuous improvement; 3) to determine compliance with Order 01-182; and 4) to share this information with other Permittees, municipal decision makers, and the public.

!	YOU MUST FILL OUT ALL THE INFORMATION REQUESTED <i>Do not leave any of the sections blank.</i>
N/A	If the question does not apply to your municipality, please indicate N/A in the space provided and provide a brief explanation
U	If the information requested is currently unavailable, please indicate U in the space provided and give a brief explanation.

This Report Form consists of the following sections:

SECTION	PAGE
I. Program Management	2-4
II. Receiving Water Limitations	5-6
III. SQMP Implementation	7-8
IV. Special Provisions	9
IV.A. Public Information and Participation Program	9-16
IV.B. Industrial/Commercial Facilities Program	17-20
IV.C. Development Planning Program	21-23
IV.D. Development Construction Program	24-26
IV.E. Public Agency Activities Program	27-38
IV.F. IC/ID Elimination Program	39-43
V. Monitoring	44
VI. Assessment of Program Effectiveness	44

Required Attachments	Separate files

Reporting Year 2011- 2012

I. Program Management

A. Permittee Name: City of Manhattan Beach

B. Permittee Program Supervisor: Jim Arndt

Title: **Director of Public Works**

Address: **3621 Bell Avenue**

City: **Manhattan Beach**

Zip Code: **90266**

Phone: **(310) 802-5363**

Fax: **(310) 802-5303**

C. In the space below, briefly describe how the storm water program is coordinated within your agency's departments and divisions. Include a description of any problems with coordination between departments. To facilitate this, complete the Table 1.

The Department of Public Works management team oversees the City's storm water pollution mitigation initiatives. The team consists of the Director of Public Works responsible for NPDES compliance, a management analyst, one maintenance superintendent, one utilities manager and administrative support personnel. The PW team communicates with staff from other City departments to coordinate the management, inspection, enforcement and compliance efforts. The City retains an environmental consultant to assist with coordinating NPDES and TMDL programs, provide staff training and to assist with emerging technical and regulatory issues.

The Public Works team meets regularly to discuss city environmental program, maintenance and infrastructure issues (i.e. maintenance of signage at storm drains, capital project updates, BMP implementation, etc.). Additionally, pertinent municipal code ordinances and City policies are reviewed regularly to ensure applicability to current requirements and practices. The Public Works Director and/or management analyst meets monthly with the City's environmental consultant to plan and coordinate TMDL and NPDES implementation activities and initiatives.

TABLE 1 - Program Management

Storm Water Management Activity	Division/Department	# of Individuals Responsible for Implementing
1. Outreach & Education	Administration/Public Works	2
2. Industrial/Commercial Inspections	Administration/Public Works	2
3. Construction Permits/Inspections	Operation & Engineering/PW Code Enforcement/ComDev	3
4. IC/ID Inspections	Waste Water Operations, PW, & PD (for field screening)	2
5. Street sweeping	Maintenance & Administration/PW	3
6. Catch Basin Cleaning	Waste Water Operations/PW	2
7. Spill Response	Waste Water Operations/PW	2
8. Development Planning (project/SUSMP review and approval)	Engineering/PW Code Enforcement/PW Planning/ComDev	9
9. Trash Collection	Maintenance & Admin/PW	3

D. Staff and Training

Attach a summary of staff training over the last fiscal year. This shall include the staff name, department, type of training, and date of training.

See attached

E. Budget Summary

1. Does your municipality have a storm water utility? Yes No

If no, describe the funding source(s) used to implement the requirements of Order No. 01-182.

2. Are the existing financial resources sufficient to accomplish all required activities? Yes No

3. Complete Table 2 to the extent that accurate information is available (indicate U in the spaces where the information is unavailable), and report any supplemental dedicated budgets for the same categories on the lines below the table.

4. List any additional state/federally funded projects related to storm water.

The City of Manhattan Beach Greenbelt Low Flow Infiltration project has been awarded \$500,000 in grant funding by Santa Monica Bay Restoration Commission Prop 84.

Program Element	Estimated Expenditures in Fiscal Year 2011-2012	Estimated Amount Needed in FY 2012-13
1. Program management a. Administrative costs b. Capital costs	a) \$51,756 b) -	a) \$50,949 b) -
2. Public Information & Participation a. Public Outreach/Education b. Employee Training c. Corporate Outreach d. Business Assistance	a) \$9,808 b) \$3,454 c) N/A d) \$1,512	a) \$11,702 b) \$4,720 c) N/A d) \$2,596
3. Industrial/Commercial inspection a. Consultant b. Restaurant & Grease insp.	a) \$ 713 b) \$24,119	a) \$3,540 b) \$30,621
4. Development Planning	\$13,231	\$13,416
5. Development Construction a. Construction inspections	\$15,000	\$15,000
6. Public Agency Activities a. Catch basin cleaning & BMP maintenance b. Municipal street sweeping c. Trash collection/recycling d. Capital costs e. Consultant assistance	a) \$170,000 b) \$221,260 c) \$3,307,641 d) \$50,000 e) \$1,281	a) \$170,000 b) \$393,277 c) \$3,416,523 d) \$500,000 e) -
7. IC/ID Program a. Operations and Maintenance b. Capital Costs	a) \$5,124 b) -	a) \$7,536 b) -
8. Monitoring—SMBBB TMDL CSMP	\$11,217	\$11,440
9. Other a. NPDES Permit fee b. TMDL consulting services c. SMBBB TMDL Implementation	a) \$25,000 b) \$12,124 c)	a) \$25,500 b) \$16,048 c)
10. TOTAL	\$3,923,740	\$4,672,868

List any supplemental dedicated budgets for the above categories:

We have a limited dedicated budget for NPDES related activities and programs that is split across multiple departments. We also have a dedicated budget for street sweeping and trash collection/recycling. The City utilizes CalRecycl Used Oil funds in part for public education regarding stormwater pollution prevention.

List any activities that have been contracted out to consultants/other agencies:

The City contracts for several maintenance activities that directly support our storm water program including: 1) street sweeping, 2) parking lot cleaning, 3) clarifier cleaning, and 4) solid waste trash and recycling collection and disposal. We also have contracted with a private firm for inspections related to industrial/commercial facilities control program. The City contracts with a consultant to assist in NPDES and TMDL compliance. The City contracts jointly with Jurisdictional Group 5&6 agencies for coordinated shoreline monitoring under the SMBBB TMDL.

II. Receiving Water Limitations (Part 2)

- A. Are you aware, or have you been notified, of any discharges from your MS4 that cause or contribute to a condition of nuisance or to the violation of any applicable water quality standards? Yes No
- B. Has the Regional Board notified you that discharges from your MS4 are causing or contributing to an exceedance of water quality standards? Yes No

The City is not aware, nor has the City been notified this year, that discharges from its MS4 are causing or contributing to exceedances of water quality standards. Other

The City of Manhattan Beach received a Notice of Violation (NOV) from the LARWQCB dated March 4, 2008 and October 15, 2009 stating that the City was in violation of waste discharge requirements established in Board Order No. 01-182 as amended by Orders R4-2006-0074 and Order No R4-2007-0042 (MS4 Permit). LARWQCB technical staff had concluded that violations of the Receiving Waters Limitations provisions of Part 2.5 of the MS4 Permit had occurred due to alleged discharges from the MS4 that caused or contributed to exceedances of bacterial objectives during summer dry weather at SMB 5-02, SMB 5-03, SMB 6-01 and SMB 6-05. The City explained in its response to the NOV that drainage from the City of Manhattan Beach is not tributary to site SMB 6-05. Furthermore, at site SMB 5-03 discharges from the storm drains are diverted to the sanitary sewer during dry weather and do not reach the shoreline. During the 2010-11 reporting year, the RWQCB removed the Santa Monica Bay Bacteria Dry Weather TMDL from the MS4 permit, and the RWQCB Executive Officer rescinded the NOV's issued in 2008 and 2009 which originally triggered the need to file a RWL Compliance report for SMB 6-01.

The City had prepared and submitted a Receiving Waters Limitation Compliance Report for Coordinated Shoreline Monitoring location SMB 5-2 (28th Street, Manhattan Beach) as an attachment to the NPDES MS4 Individual Annual Report for Fiscal Year 2006-2007 (prior to the NOV) because the low flow diversions for this storm drain system had not been brought online in time for the summer dry weather bacteria TMDL deadline. The low flow diversions were started up and an update was submitted with the Annual Report for Fiscal Year 2008-09. In response to the NOV mentioned above, the City submitted a Receiving Waters Limitation Compliance Report for shoreline monitoring site SMB 6-01 under the Santa Monica Bay Beaches Bacteria (SMBBB) TMDL Coordinated Shoreline Monitoring Plan for the 2007-2008 reporting year and a RWL Compliance status report for SMB 6-01 was attached with the 2009-10 Individual Annual Report. The City also provided a compliance report for SMB 5-2 and SMB 6-1 with the reporting year 2010-11 Annual Report in order to address both summer dry weather and winter dry weather conditions at SMB 5-2 and SMB 6-01. Another status report is not required until the 2012-13 reporting year. The City has not received a response from the RWQCB's staff on any of the RWL Compliance reports filed to date.

The abovementioned notices and the monitoring reports did not evidence, or

conclusively prove that discharges from the City's MS4 cause or contribute to a violation of water quality standards. Other than the now rescinded notice of violation, the City has not been notified that runoff from the City is contributing to or causing exceedances of water quality standards. As a good faith means of fully apprising the Regional Board of its activities and if necessary to comply with the provisions of the next MS4 permit, the City will consider whether to submit a RWL report with the 2012-13 Annual Report. The City continues to evaluate its stormwater program and in cooperation with the other agencies of Jurisdictional Groups 5 and 6, further investigate sources of potential pollutants and ways to treat and prevent stormwater runoff.

Results of the Santa Monica Bay Coordinated Shoreline Monitoring Program and data collected by the City of Los Angeles EMD under the Monitoring and Reporting Program CI 6948 under the MS4 Permit monitoring program are discussed in the Assessment of Program Effectiveness attachment to this Annual Report, in response to Item 5 *A description of water quality improvements or degradation in your watershed over the past fiscal year.* These results indicate that the two open beach shoreline monitoring locations in Manhattan Beach, SMB 5-1 and SMB 5-3, have continued to exhibit high water quality during both summer dry weather and winter dry weather consistent with their historically high water quality and both sites continue to exhibit lower exceedance rates than the reference beach. Thus no receiving waters limitation compliance reports are necessary for those monitoring locations.

- C. If you answered Yes to either of the above questions, you must attach a Receiving Water Limitations (RWL) Compliance Report. The Report must include the following:
1. A description of the pollutants that are in exceedance and an analysis of possible sources;
 2. A plan to comply with the RWL (Permit, Part 2);
 3. Changes to the SQMP to eliminate water quality exceedances;
 4. Enhanced monitoring to demonstrate compliance; and
 5. Results of implementation.

III. SQMP Implementation (Part 3)

- A. Has your agency implemented the SQMP and any additional controls necessary to reduce the discharges of pollutants in storm water to the maximum extent practicable? Yes No
- B. If your agency has implemented additional or different controls than described in the countywide SQMP, has your agency developed a local SQMP that reflects the conditions in its jurisdiction and specifies activities being implemented under the appropriate elements described in the countywide SQMP? Yes No
- C. Describe the status of developing a local SQMP in the box below.

The City of Manhattan Beach has implemented the SQMP requirements as outlined in the County of Los Angeles NPDES permit requirements. In addition to the Countywide SQMP the City of Manhattan Beach is also implementing additional activities as they are developed under the Jurisdictional Group 5 & 6 Implementation Plan for the Santa Monica Bay Beaches Bacteria TMDL.

- D. If applicable, describe an additional BMP, in addition to those in the countywide SQMP, that your city has implemented to reduce pollutants in storm water to the maximum extent practicable.

The City requires all new commercial development to have covered trash enclosures that are plumbed to the sanitary sewer system. The City is conducting annual inspections of restaurants under the Clean Bay Restaurant certification program established in cooperation with the Santa Monica Bay Restoration Commission.

- E. Watershed Management Committees (WMCs)
1. Which WMC are you in? **Ballona Creek and Other Urban**
 2. Who is your designated representative to the WMC?
Kathleen McGowan, P.E./Consultant
 3. How many WMC meetings did you participate in last year? **Four (4)**
 4. Describe specific improvements to your storm water management program as a result of WMC meetings.

Our WMC has been a forum to share and disseminate information on new initiatives with respect to Low Impact Development and TMDL Implementation programs. In addition to the WMC meetings, the City participates in monthly meetings of the Jurisdictional Groups 5 & 6 agencies to plan and coordinate Santa Monica Bay Beaches Bacteria TMDL implementation activities.

5. Attach any comments or suggestions regarding your WMC. **None**

F. Storm Water Ordinance

1. Have you adopted a storm water and urban runoff ordinance to enforce all requirements of Order 01-182? Yes No
If not, describe the status of adopting such an ordinance.

N/A

2. If yes, have you already submitted a copy of the ordinance to the Regional Board? Yes No
If not, please attach a copy to this Report.

3. Were any amendments made to your storm water ordinance during the last fiscal year? Yes No
If yes, attach a copy of amendments to this Report.

G. Discharge Prohibitions

1. List any non-storm water discharges you feel should be further regulated:

None

2. List any non-storm water discharges you feel should be exempt, and provide an explanation for each:

Potable water releases necessary to comply with Safe Drinking Water Act standards should be exempt from the MS4 discharge prohibitions that cause or contribute to exceedances of recreational bacteria standards. While these releases in themselves do not contain indicator bacteria, when discharged through the storm drain system they may result in dry weather discharges to Santa Monica Bay which could contribute to exceedances of the Bacteria TMDL. The City believes that as a matter of good public policy, potable water discharges necessary to maintain the quality of potable water supplies must take a higher priority for the protection of public health than recreational water standards. Thus discharges from the MS4 associated with potable water releases should be exempt from the discharge prohibition.

IV. Special Provisions (Part 4)

A. Public Information and Participation (Part 4.B)

In addition to answering the following questions, attach a summary of all storm water education activities that your agency conducted or participated in last year.

1. No Dumping Message

a) How many storm drain inlets does your agency own? **348**

b) How many storm drain inlets were marked with a no dumping message in the last fiscal year? **35**

c) What is the total number of storm drain inlets that are legibly marked with a no dumping message? **348**

If this number is less than the number in question 1.b, describe why all inlets have not been marked, the process used to implement this requirement, and the expected completion date.

All are legible.

d) How many public access points to creeks, channels, and other water bodies within your jurisdiction have been posted with no dumping signage in the past year? **None-previously posted**

Describe your agency's status of implementing this requirement by the date required in Order No. 01-182.

There is only one channel within the City; however it is fenced to prevent public access. Even so, it is posted with no dumping signage.

2. Reporting Hotline

- a) Has your agency established its own hotline for reporting and for general storm water management information? Yes No
- b) If so, what is the number? **We use the 888CleanLA #**
- c) Is this information listed in the government pages of the telephone book? Yes No
- d) If no, is your agency coordinated with the countywide hotline? **N/A** Yes No
- e) Do you keep record of the number of calls received and how they were responded to? Yes No
- f) How many calls were received in the last fiscal year? **101 calls directly to the City, the City does not have a count of calls that were handled via 888CleanLA**

- g) Describe the process used to respond to hotline calls.

Calls received by Public Works through the main phone number or from the County Hotline are directed to the appropriate department depending on the nature of the call. In addition, Public Works staff performs site inspections. If a violation is apparent, the offending party is cited and must clean up or pay for the cleaning of contaminate discharge. PW personnel monitor the cleanup and provide any further assistance.

- h) Have you provided the Principal Permittee with your current reporting contact information? Yes No
- i) Have you compiled a list of the general public reporting contacts for all Permittees and posted it on the www.888CleanLA.com web site (Principal Permittee only)? Yes No
- If not, when is this scheduled to occur? **N/A**

3. Outreach and Education

- a) Describe the strategy developed to provide outreach and bilingual materials to target ethnic communities. Include an explanation of why each community was chosen as a target, how program effectiveness will be determined, and status of implementation. (Principal Permittee only)

N/A

- b) Did the Principal Permittee organize quarterly Public Outreach Strategy meetings that you were aware of? Yes No

How many Public Outreach Strategy meetings did your agency participate in last year? **Four (4)**

plus twelve (12) Jurisdictional Group 5 & 6 coordination meetings

Explain why your agency did not attend any or all of the organized meetings.

Identify specific improvements to your storm water education program as a result of these meetings:

The meetings helped us stay up-to-date regarding available materials for public dissemination and timing of Countywide outreach. The meetings also provided a forum for sharing new ideas and for disseminating information.

List suggestions to increase the usefulness of quarterly meetings:

We appreciate the webcasting of the quarterly meetings to reduce the time and energy cost of commuting to the meeting. Such a medium is more convenient and consistent with city policies to reduce greenhouse gas emissions and consumption of fossil fuel associated with travel to meetings. The City supports the continued use of webcasts for these meetings.

If quarterly Public Outreach Strategy meetings were not organized, explain why not and when this requirement will be implemented (*Principal Permittee only*).

N/A

- c) Approximately how many impressions were made last year on the general public about storm water quality via print, local TV, local radio, or other media?

The City's local media placements and related news articles produced approximately 734,307 impressions: City Newsletter quarterly (14,474x4=57,896), Eight inserts in solid waste bills or door hangers to single-family residences (8x 8,392 =67,136) Two ads in Beach Reporter (2x55,500=111,000) Five news articles in Daily Breeze (66,355x5=331,775), three news articles in Beach Reporter (3x55,500=166,500)] Regional news articles in LA Times not included in count.

- d) Describe efforts your agency made to educate local schools on storm water pollution.

We have an extensive outreach program to the schools through our contract with our franchise solid waste hauler. We have a dedicated recycling coordinator who works with schools and includes a storm water pollution prevention message. The City is supporting a parent implemented environmental program in the public elementary schools, "Grades of Green".

Also, as part of the Jurisdictional Groups 5&6 joint implementation programs for Santa Monica Bay Beaches Bacteria TMDL, the J5&6 website provides resource links for stormwater related curriculum and other hands on activities for teachers.

We also conduct outreach to school age children through our community events. The booth that PW runs is always the most popular, evidenced by the long line, with kids because we have an interactive spin-the-wheel quiz game. Kids and their parents answer environmental questions, including questions on storm drain pollution, for prizes. We also hand out educational brochures on storm water pollution with the prizes.

- e) Did you provide all schools within each school district in Los Angeles County with materials necessary to educate a minimum of 50 percent of all school children (K-12) every 2 years on storm water pollution (Principal Permittee only)?

Yes No

If not, explain why.

N/A

- f) Describe the strategy developed to measure the effectiveness of in-school educational programs, including assessing students' knowledge of storm water pollution problems and solutions before and after educational efforts (Principal Permittee only).

N/A

For Permit Years 2-5, attach an assessment of the effectiveness

of in-school storm water education programs.

g) What is the behavioral change target that was developed based on sociological data and other studies (*Principal Permittee only*)?

N/A

If no target has been developed, explain why and describe the status of developing a target.

N/A

What is the status of meeting the target by the end of Year 5?

N/A

4. Pollutant-Specific Outreach

a) Attach a description of each watershed-specific outreach program that your agency developed (*Principal Permittee only*). All pollutants listed in Table 1 (Section B.1.d.) must be included. **N/A**

b) Did your agency cooperate with the Principal Permittee to develop specific outreach programs to target pollutants in your area? Yes No

c) Did your agency help distribute pollutant-specific materials in your city? Yes No

d) Describe how your agency has made outreach material available to the general public, schools, community groups, contractors and developers, etc...

Public Works staff made outreach material available to contractors and developers through the public counter. We place inserts in utility bills to residents. Additionally, we distribute a quarterly newsletter and provide outreach and educational materials at our Earth Day and Hometown Fair events and through the public works page on the City's website. City has worked jointly with other south bay cities to develop and launch a new website focused on public outreach to address the Santa Monica Bay Beaches Bacteria TMDL. The website addresses three key target audiences: beach/pier goers, residents and businesses, see: www.SouthBayStormwaterProgram.com .

5. Businesses Program

a) Briefly describe the Corporate Outreach Program that has been developed to target gas stations and restaurant chains (*Principal Permittee only*).

N/A

- b) How many corporate managers did your agency (*Principal Permittee only*) reach last year? **N/A**
- c) What is the total number of corporations to be reached through this program (*Principal Permittee only*)? **N/A**
- d) Is your agency meeting the requirement of reaching all gas station and restaurant corporations once every two years (*Principal Permittee only*)? **N/A** Yes No
If not, describe measures that will be taken to fully implement this requirement.

N/A

- e) Has your agency developed and/or implemented a Business Assistance Program? Yes No
If so, briefly describe your agency's program, including the number of businesses assisted, the type of assistance, and an assessment of the program's effectiveness.

The City of Manhattan Beach, along with the cities of Hermosa Beach, Redondo Beach, and Torrance in cooperation with the Santa Monica Bay Restoration Commission, has implemented the Clean Bay Restaurant Certification program targeting food service establishments with exposure to stormwater. The agencies developed a comprehensive 28-point storm water inspection checklist that requires 100% compliance in order for the facility to be awarded a Clean Bay Restaurant Certification by the Santa Monica Bay Restoration—this checklist far exceeds the minimum requirements of the MS4 NPDES Permit. The Santa Monica Bay Restoration Commission publicizes the names and locations of Clean Bay certified restaurants on their website and through press releases. Clean Bay Restaurant certificates are posted in public view, either in the window or inside the restaurant.

The City provides outreach to businesses on a variety of environmental programs through the South Bay Environmental Services Center, in collaboration with the South Bay Cities Council of Governments.

6. Did you encourage local radio stations and newspapers to use public service announcements? Yes No
How many media outlets were contacted? **2**
Which newspapers or radio stations ran them?

Beach Reporter, Daily Breeze,

Who was the audience?

Local residents and businesses.

7. Did you supplement the County's media purchase by funding additional media buys? Yes No
Estimated dollar value/in-kind contribution: **\$500**
Type of media purchased: **Print**
Frequency of the buys: **varies**
Did another agency help with the purchase? Yes No
8. Did you work with local business, the County, or other Permittees to place non-traditional advertising? Yes No
If so, describe the type of advertising.

Restaurants who achieve the Clean Bay Restaurant certification post their certificates in public view in their establishments.

A banner was hung over the Sepulveda Blvd and Manhattan Beach Blvd intersection for 2 weeks prior to each composting workshop.

9. Did you establish local community partnerships to distribute educational storm water pollution prevention material? Yes No
Describe the materials that were distributed:

The City of Manhattan Beach again co-sponsored a very well organized and well attended Earth Day festival. A number of organizations set up tents and offer earth-friendly shopping and information. The Public Works Department operated our environmental booth at the Earth Day festival. We hand out educational brochures related to storm water prevention pollution along with the prizes.

Who were the key partners? **Chamber of Commerce**
Who was the audience (businesses, schools, etc.)?

Residents and local businesses.

10. Did you participate in or publicize workshops or community events to discuss storm water pollution? Yes No
How many events did you attend? **3**
11. Does your agency have a website that provides storm water pollution prevention information? Yes No
If so, what is the address? <http://www.ci.manhattan-beach.ca.us/Index.aspx?page=1519>
also
<http://www.ci.manhattan-beach.ca.us/Index.aspx?page=1506>

12. Has awareness increased in your community regarding storm water pollution? Yes No
Do you feel that behaviors have changed? Yes No

Explain the basis for your answers. Include a description of any evaluation methods that are used to determine the effectiveness of your agency's outreach.

Manhattan Beach residents enjoy a lifestyle that includes many outdoor activities. Most residents frequent the beach and pier as part of their routine activities. The City passed a plastic shopping bag ban with support from City Council and residents. Community awareness can be gauged by the interest in resident participation on the Environmental Task Force and the frequency of calls and complaints received regarding irrigation runoff.

The Jurisdictional Groups 5 & 6 agencies conducted a survey posted on the South Bay Stormwater Program website to evaluate the baseline knowledge of residents and target audiences as the foundation for the joint public outreach program. Results of the survey included:

- **100% of those who responded agreed that urban runoff is an environmental issue**
- **94% of those who responded new that rain carries pollution directly to the ocean**
- **77.9% of respondents agreed that irrigation over-spray causes water pollution**

When asked to rank a list of thirteen activities from highest to lowest the top ranking activities as a cause of ocean and beach water pollution were: plastic bags or water bottles, littering, over fertilizing, cigarette butts, and take-out or fast food containers.

13. How would you modify the storm water public education program to improve it on the City or County level?

The public education program is not static--we look for opportunities to improve the public education program. The City is working together with sister cities and the Santa Monica Bay Restoration Commission to increase public awareness of the Santa Monica Bay TMDLs and to provide a consistent message among the agencies regarding how residents, businesses and beach goers can help prevent stormwater pollution

B. Industrial/Commercial Facilities Program

1. Critical Source Inventory Database

Did you (individually or jointly) update the Database for Critical Sources Inventory? Yes No

Comments/Explanation/Conclusion: **The contract inspector updated the list based on field observations.**

2. Inspection Program

Provide the reporting data as suggested in the following tables.

Category	Initial Number of Facilities at the start of cycle proposed for inspection by categories (after the initial year, the updated number based on the new data)	Number of facilities inspected in the current reporting year	% Completed at the time of this report for present cycle (from the initial value, and from the updated value after first cycle)	Total number since permit adoption
Landfills	N/A, we have no landfills	N/A	N/A	N/A
TSDf	N/A, we have no TSDf	N/A	N/A	N/A
Restaurants	144*	66	>600%	922 + 66= 988
All other	45	16	>100%	188 + 16 = 204

Comments/Explanation/Conclusion: ***Restaurants were inspected during the reporting year as part of the Clean Bay Restaurant Certification program. Every year the number of facilities fluctuates up and down due to the transitory nature of these businesses.**

NPDES No. CAS 004001 LA County Municipal Stormwater Permit Order No. 01-182
Attachment U-4 Individual Annual Report Form

3. **BMPs Implementation**

Provide the reporting data as suggested in the following table.

Category	Number of facilities inspected by category in this reporting year	Number of facilities identified as adequately implementing BMPs as specified in this reporting year	% adequately implementing out of total in this reporting year	Number of facilities required to implement or upgrade in this reporting year	Number of facilities inspected by category in this reporting cycle	Number of facilities identified as adequately implementing BMPs as specified in this reporting cycle	% adequately implementing out of total in this reporting cycle	Number of facilities required to implement or upgrade in this reporting cycle	Total Number of inspections during this permit adequately implementing	Total Number during this permit required to implement or upgrade
Restaurants	66	62	94%	4	NA**	NA**	NA**	NA**	646+62=708	79+4=83
Automotive	0	NA	NA	NA	82	48	58%	34	*	*
Laundry***	16	16	100%	0	25+16=41	41	100%	0	*	*
Printing	0	NA	NA	NA	4	4	100%	0	*	*
Misc. categories	0	NA	NA	NA	13	11	84%	2	*	*

Comments/Explanation/Conclusion:

***No categorical information available from first cycle, only total number of facilities is available for first cycle.**
**** The term “cycle” is no longer applicable for restaurant inspections in Manhattan Beach because they are being inspected annually now under the SMBBB TMDL Implementation**
***** Exposure assessments were conducted for laundries to determine whether there were laundry operations/activity in exposure to stormwater that warranted inspection—none of the facilities assessed had had activity in exposure to stormwater.**

NPDES No. CAS 004001 LA County Municipal Stormwater Permit Order No. 01-182
Attachment U-4 Individual Annual Report Form

4. Enforcement Activities

Provide the reporting data as suggested in the following tables.

Enforcement Actions by categories (e.g. Warning letter, NOV, referral to D.A., etc.)	Number of facilities issued enforcement actions in the current reporting year	Number of facilities issued enforcement actions in the current reporting cycle	Number of facilities (re)inspected due to enforcement actions in current reporting year	Number of facilities (re)inspected due to enforcement actions in current reporting cycle	Number of facilities brought into compliance in the current reporting year	Number of facilities brought into compliance in current reporting cycle	Total number of enforcement actions since permit adoption (by category)
Warning letter	0	0	0	39	NA	38	66
NOV via facility signature on inspection report	4	112+4=116	0*	94	0*	49	112+4=116
Referral	0	0	0	0	NA	NA	1

Facilities by category	Number of Warning letters	Number of NOVs	Number of Referral	Number of Other
Restaurants	0	4	0	0
Automotive	0	0	0	0
Misc.	0	0	0	0

Comments/Explanation/Conclusion:	<p>NOV consists of copy of inspection sheet with needed corrections noted and signature from manager or employee onsite at time of inspection.</p> <p>*not all follow up inspections have been completed for restaurants before the close of the reporting year</p>
----------------------------------	---

5. Program Implementation Effectiveness Assessment

Please give a brief assessment of the implementation of the program in removing pollutants from the storm water discharges. Please provide an explanation. Suggested improvements or adjustments based on the knowledge gained through this reporting period activities must be reflected in a change in the SQMP, if warranted.

Highly Effective

Somewhat Effective

Non-effective

Comments/Explanation/Conclusion:

6. You must also submit a quarterly electronic submittal of your Industrial/Commercial Facilities Program activities.—**N/A—no longer a requirement**

C. Development Planning Program (Part 4.D)

1. Does your agency have a process to minimize impacts from storm water and urban runoff on the biological integrity of natural drainage systems and water bodies in accordance with requirements under CEQA, Section 404 of the CWA, local ordinances, and other legal authorities? **N/A we do not have any natural drainage systems.** Yes No

Attach examples showing how storm water quality impacts were addressed in environmental documents for projects over the past year.

2. Does your agency have procedures to include the following requirements in all priority development and redevelopment projects:
- a) Maximize the percentage of permeable surfaces to allow more percolation of storm water into the ground? Yes No
 - b) Minimize the quantity of storm water directed to impermeable surfaces and the MS4? Yes No
 - c) Minimize pollution emanating from parking lots through the use of appropriate treatment control BMPs and good housekeeping practices? Yes No
 - d) Provide for appropriate permanent measures to reduce storm water pollutant loads from the development site? Yes No

3. List the types and numbers of BMPs that your agency required for priority projects to meet the requirements described above.

• **No SUSMP projects during the reporting year**

4. Describe the status of the development or implementation of peak flow controls in Natural Drainage Systems.

N/A There are no recognized natural drainage systems within the City's four square mile limits.

5. Has your agency amended codes and/or ordinances to give legal effect to the SUSMP changes required in the Permit? Yes No

6. Describe the process your agency uses to include SUSMP design standards in new development and redevelopment project approvals.

The City of Manhattan Beach has incorporated the SUSMP requirements in our local ordinance and reference future NPDES program changes as enforceable.

7. How many of each of the following projects did your agency review and condition to meet SUSMP requirements last year?

- a) Residential 0
- b) Commercial 0
- c) Industrial 0
- d) Automotive Service Facilities 0
- e) Retail Gasoline Outlets 0
- f) Restaurants 0
- g) Parking Lots 0
- h) Projects located in or directly adjacent to or discharging directly to an environmentally sensitive area 0
- i) Total number of permits issued to priority projects 0

8. What is the percentage of total development projects that were conditioned to meet SUSMP requirements? <1%

9. How has your agency prepared to reduce the SUSMP threshold for industrial/commercial facilities to 1 acre from 100,000 square feet in 2003?

The City of Manhattan Beach has incorporated the SUSMP requirements in our local ordinance and referenced future program changes as enforceable. No changes to the municipal code were necessary to cover the change in SUSMP threshold for industrial/commercial facilities. We also monitor the size of all developments and industrial/commercial facilities.

10. After 2003, how many additional projects per year will require/did require implementation of SUSMP requirements as a result of the lower threshold? **0-1**
11. Does your agency participate in an approved regional or sub-regional storm water mitigation program to substitute in part or wholly SUSMP requirements for new development? Yes No
12. Has your agency modified its planning procedures for preparing and reviewing CEQA documents to consider potential storm water quality impacts and provide for appropriate mitigation? Yes No

If no, provide an explanation and an expected date of completion.

N/A

13. Did your agency update any of the following General Plan elements in the past year?
- a) Land Use Yes No
- b) Housing Yes No
- c) Conservation Yes No
- d) Open Space Yes No

If yes, please describe how watershed and storm water quality and quantity management considerations were included.

14. How many targeted staff were trained last year? **9**
15. How many targeted staff are trained annually? **100%**
16. What percentage of total staff are trained annually? **50-75%**
17. Has your agency developed and made available development planning guidelines? Yes No
18. If no, what is the expected date that guidelines will be developed and available to developers? **N/A**
19. What is the status of completion of the technical manual for siting and design of BMPs for the development community?

Our Community Development staff uses the County of Los Angeles' Development Planning for Storm Water Management and CASQA BMP handbooks.

D. Development Construction Program

1. Describe your agency's program to control runoff from construction activity at all construction sites within its jurisdiction.

The City of Manhattan Beach requires all construction activity to comply with storm water requirements stated in local codes and ordinances as well as those listed in a site runoff control checklist. Public Works' inspectors must sign-off the checklist prior to the start of any construction activities and then monitor the site periodically to ensure the job site is clean and in conformance with City codes and ordinances.

2. Does your agency require the preparation, submittal, and implementation of a Local Storm Water Pollution Prevention Plan (Local SWPPP) prior to the issuance of a grading permit for all sites that meet one or all of the following criteria? **Local SWPPPs are no longer utilized since sites one acre or greater are required to seek coverage under the Statewide General Construction Permit.**

- a) Will result in soil disturbance of one acre or greater Yes No
- b) Is within, directly adjacent to, or is discharging directly to an environmentally sensitive area Yes No
- c) Is located in a hillside area Yes No

3. Attach one example of a local SWPPP

4. Describe the process your agency uses to require proof of filing a Notice of Intent for coverage under the State General Construction Activity Storm Water permit and a certification that a SWPPP has been prepared prior to issuing a grading permit?

We use a permit checklist and plan check review to determine if a State General Construction Activity Storm Water permit is required. If so, the developer is conditioned to show proof of filing a Notice of Intent for coverage and preparing a SWPPP.

- 5. How many building/grading permits were issued to sites requiring Local SWPPPs last year? **0**
- 6. How many building/grading permits were issued to sites requiring coverage under the General Construction Activities Storm Water Permit last year? **0**
- 7. How many building/grading permits were issued to construction site less than one acre in size last year? **52**

43 new construction, 5 major remodels, 4 grading permits

- 8. How many construction sites were inspected during the last wet season?

Even though few construction sites meet the 1 acre minimum size for mandatory inspections under the MS4 Permit, it is the City's practice that all new development construction sites, all major remodels and all grading sites are inspected for compliance with stormwater protection requirements. The Residential Construction/Code Enforcement Officer conducts daily rounds of active construction sites. Whenever a storm is anticipated these sites receive thorough inspections to ensure that BMPs are properly maintained.

all new construction, major remodel and grading permits

- 9. Complete the table below.

Type of Violation	# of Violations	% of Total Inspections	# of Follow-up Inspections	# of Enforcement Actions
Off-site discharge of sediment	4	<100%	4	0
Off-site discharge of other pollutants	0	NA	NA	NA
No or inadequate SWPPP	NA	NA	NA	NA
Inadequate BMP/SWPPP implementation	0	NA	NA	NA

10. Describe the process for taking enforcement actions against construction site violations, including the types of actions that are taken.

The City's typical enforcement process includes sending a Police Code Enforcement Officer and a Public Works Inspector to the site in question. Both City officials perform a site inspection, question the offending party and immediately request the clean up and further prevention of contaminant runoff. The PW Inspector will call for PW staff assistance to clean up the spill, if appropriate. The PW Inspector then monitors the site until cleanup activities are completed. The Police Code Enforcement Officer serves the Notice of Violation. The Public Works Inspector also has the option to "red tag", or put a stop on the work at the site until the violation is corrected.

11. Describe the system that your agency uses to track the issuance of grading permits.

The Community Development Department uses Permits-Plus software to track the issuance of grading permits.

E. Public Agency Activities (Part 4.F)

1. Sewage System Maintenance, Overflow, and Spill Prevention (only applicable to agencies that own and/or operate a sanitary sewer system)

- a) Has your agency developed and implemented a response plan for sanitary sewer overflows that includes the requirements in Order 01-182? Yes No
- b) How many sanitary sewer overflows occurred within your jurisdiction? **5**
- c) How many did your agency respond to? **101 calls received and of these 96 were regarding SSOs from private laterals**
- d) Did your agency investigate all complaints received? Yes No
- e) How many complaints were received? **Most of these complaints were associated with private laterals—the City responded and provided information and assistance, none of these reached the storm drain system.** **101**
- f) Upon notification, did your agency immediately respond to overflows by containment? Yes No
- g) Did your agency notify appropriate sewer and public health agencies when a sewer overflowed to the MS4? Yes No
- h) Did your agency implement a program to prevent sewage spills or leaks from sewage facilities from entering the MS4? Yes No
If so, describe the program:

Our sanitary sewer overflow response plan describes procedures for preventing sanitary sewer spills and leaks from entering the MS4. The City's Public Works staff cleans our entire sewer system twice a year as a preventative measure. We also require the installation of backflow prevention devices on new and redevelopment construction projects. We dispatch a city-owned sewer cleaning vacuum truck to sites with potential sewage spills (blockage or backup calls) in order to contain and clean up spills if they do occur.

The City is implementing its SSMP in accordance with the required schedule under the Statewide General Waste Discharge Requirements for Sanitary Sewer Systems (Order No. 2006-0003).

- i) Did your agency implement a program to identify, repair, and remediate sanitary sewer blockages, exfiltration, overflow, and wet weather overflows from sanitary sewers to the MS4? Yes No
- If so, describe the program:

Public Works maintenance staff tracked sewer blockages reported by residents and management used this information to schedule additional cleanings. Additionally, staff uses video monitoring to identify the source of blockages and to identify potential for future blockages. All sewer systems are cleaned twice a year at minimum and then monthly or quarterly for those areas where frequent blockages have been reported.

2. Public Construction Activities Management

- a) What percentage of public construction sites 5 acres or greater in size did your agency obtain coverage under the State of California General Construction Activities Storm Water Discharge Permit?

We did not have any public construction sites 5 acres or larger this year. N/A %

- b) Give an explanation for any sites greater than 5 acres that were not covered:

N/A

- c) What is the total number of active public construction sites? **35**
- How many were 5 acres or greater in size? **0**

- d) (After March, 2003) Did your agency obtain coverage under the State of California General Construction Activities Storm Water Discharge Permit coverage for public construction sites for sites one acre or greater? Yes No

3. Vehicle Maintenance/Material Storage Facilities/Corporation Yards Management

- a) Did your agency implement pollution prevention plans for each public vehicle maintenance facility, material storage facility, and corporation yard? Yes No

- b) Briefly describe how your agency implements the following, and any additional, BMPs to minimize pollutant discharges in storm water:

- (1) Good housekeeping practices
- (2) Material storage control
- (3) Vehicle leaks and spill control
- (4) Illicit discharge control

1. **Good Housekeeping:** PW employees are trained on good housekeeping practices related to their individual positions. Specific examples include: collecting slurry from cement saw cutting operations; washing cars at commercial facilities or over on-site clarifier at PW Yard that is connected to a second clarifier and a CDS unit; landscape maintenance vendor vacuums all residual material from sidewalks and gutters with each job; Public Safety Facility parking lots are swept three times per week; weekly vacuuming of PW Yard hardscape areas; weekly sweeping of public parking lots.
2. **Material Storage Control:** Solvent-based materials are kept under a covered storage area with secondary containment.
3. **Vehicle Leaks and Spill Control:** City vehicles receive regularly scheduled preventative maintenance (PM). This includes inspection for leaks. Between PM visits each driver is required to regularly inspect his/her vehicle for any problems, including leaks. If leaks are noticed the vehicle is brought in for repair immediately. Fleet Maintenance staff also dry sweep the garage area daily and as needed. Spills are contained using a processed volcanic absorbent. The absorbent is collected and disposed of at a proper facility.
4. **Illicit Discharge Control:** Public Works, Community Development and Police Code Enforcement staffs are trained on how to identify illicit discharges. Each staff member is responsible for taking the appropriate action in the event they recognize an illicit discharge. Public Works staff also participate in preventative measures to control illicit discharges such as regular televising of sewer and storm drain lines for illegal connections or blockages. Any illicit discharges related to sewer system problems or public maintenance or construction activities are contained, tracked and recovered using vacuum trucks at storm drain locations downstream. (See attachments.)

c) Are all Permittee owned and/or operated vehicle/equipment wash areas self-contained, covered, equipped with a clarifier, and properly connected to the sanitary sewer? Yes No

If not, what is the status of implementing this requirement?

The City yard has two open vehicle wash pads, which are not used during inclement weather. Low-flow runoff is directed to a clarifier and then to the City's sanitary sewer system. The yard has one additional clarifier and a CDS unit to capture debris, oils and other hydrocarbons from the parking lot areas. The CDS unit is also equipped with floating filters that capture hydrocarbons before diverting runoff to the MS4. Appropriate BMPs have been put in place and we do not have plans to build a sheltered wash area.

- d) How many Permittee owned and/or operated vehicle/equipment wash areas are scheduled to be redeveloped to include the BMPs listed above? **0**

4. Landscape and Recreational Facilities Management

- a) Has your agency developed a standardized protocol for the routine and non-routine application of pesticides, herbicides (including pre-emergents), and fertilizers?

Yes No

Briefly describe this protocol:

- **The City's Maintenance Superintendent applies to the County agricultural commissioner annually for a restricted materials permit**
- **Annually, the city's PCA licensed Maintenance Superintendent reviews pesticide recommendations provided by a state certified Pest Control Officer (PCO).**
- **Every City location and facility has a list of PCA recommended chemicals and this list is reviewed annually. Also, contract sprayers are limited to only applying listed chemicals.**
- **The contract sprayer must give the City's Maintenance Superintendent two-week notification and a list of what types of chemicals and quantities will be sprayed.**
- **The Maintenance Superintendent then has final approval on any pesticide and herbicide applications.**

- b) How does your agency ensure that there is no application of pesticides or fertilizers immediately before, during, or immediately after a rain event or when water is flowing off the area to be applied?

All City pesticide and fertilizer contracts include statement restricting contract workers from spraying chemicals before, during and after rain events. IPM (Integrated Pest Management) techniques are utilized to minimize the amount of pesticides that are applied as detailed in the City's Least-Toxic Integrated Pest Management Policy No chemicals or pesticides of any kind are to be used in tot lots and/or children's play areas, regardless of play surface (sand or wood chip)

As a safeguard, the City's Maintenance Superintendent has final approval on all spraying activities

- c) Are any banned pesticides, herbicides, fungicides, or rodenticides stored or applied in your agency's jurisdiction that you know of? Yes No

If so, list them:

N/A

- d) What percentage of your agency's staff that apply pesticides are certified by the California Department of Food and Agriculture, or are under the direct supervision of a certified pesticide applicator? **N/A City Staff does not apply pesticides**

- e) Describe procedures your agency has implemented to encourage retention and planting of native vegetation and to reduce water, fertilizer, and pesticide needs:

The City's Public Works staff plant native vegetation where appropriate. We also have a botanical garden demonstrating xeriscaping in conjunction with native vegetation. Additionally, as mentioned above, we incorporate an Integrated Pesticide Management approach and restrictive statements in City contracts.

5. Storm Drain Operation and Management

- a) Did your agency designate catch basin inlets within its jurisdiction as Priority A; Priority B; and Priority C? Yes No

- b) How many of each designation exist in your jurisdiction?

Priority A: **18**
 Priority B: **34**
 Priority C: **390 plus approx. 80 privately owned but maintained by City**

- c) Is your city subject to a trash TMDL? Yes No
- d) If yes, describe the activities and/or implementation measures that your agency conducted pursuant to the TMDL and any other trash reduction efforts that occurred.

The Santa Monica Bay Nearshore and Offshore Marine Debris TMDL became effective March 20, 2012. The City will be submitting a Trash Monitoring and Reporting Plan by September 20, 2012.

The City instituted a variety of trash control and reduction measures well before the Marine Debris TMDL was adopted. These measures include but are not limited to:

- **The City has installed and maintains ten (10) hydrodynamic separators (CDS units) within the storm drain system.**
- **The City installed trash exclusion devices on high priority catch basin openings.**
- **When installing trash cans in municipal parks and the public right-of-way, the City utilizes cans with lids— usually the type with a small hole in the center that allows the user to deposit trash but prevents trash from being blown out of the trash can by wind and also deters birds and other animals from spreading trash.**

Due to increased effectiveness of source control BMPs for trash and litter as well as the installation of trash exclusion devices on catch basin openings, the City has been able to reduce the frequency of catch basin cleaning and has re-designated to Priority B or C catch basins which in previous years were Priority A or B.

- e) How many times were all Priority A basins cleaned last year? **Four times**
- f) How many times were all Priority B basins cleaned last year? **Two or more times**
- g) How many times were all Priority C basins cleaned last year? **Once or twice**
- h) How much total waste was collected in tons from catch basin clean-outs last year? **20.54 CY from catch basins, 14.2 CY from CDS units.** **34.74 cubic yards**
- i) Attach a record of all catch basins in your jurisdiction. This shall identify each basin as City or County owned, and Priority A, B, or C. For all basins that are owned and operated by your agency, include dates that each was cleaned out over the past year. **See attached—electronic file.**
- j) Did your agency place and maintain trash receptacles at all transit stops within its jurisdiction. Yes No
- k) How many new trash receptacles were installed last year? **None last year. The City has already installed far in excess of the required number of trash receptacles with some 459 located throughout the City. An additional 126 receptacles for glass, plastic and aluminum beverage containers are located along the strand and in the business districts.**
- l) Did your agency place special conditions for events that generated substantial quantities of trash and litter including provisions that:
- (1) Provide for the proper management of trash and litter generated from the event? Yes No
 - (2) Arrange for temporary screens to be placed on catch basins? Yes No
 - (3) Or for catch basins in that area to be cleaned out subsequent to the event and prior to any rain? Yes No

- m) Did your agency inspect the legibility of the catch basin stencil or labels? Yes No
What percentage of stencils were legible? **90%**
35 were re-stenciled
- n) Were illegible stencils recorded and re-stenciled or re-labeled within 180 days of inspection? Yes No
- o) Did your agency visually monitor Permittee-owned open channel storm drains and other drainage structures for debris at least annually and identify and prioritize problem areas of illicit discharge for regular inspection? Yes No
Is the prioritization attached? **The City has only one open channel.** Yes No
- p) Did your agency review its maintenance activities to assure that appropriate storm water BMPs are being utilized to protect water quality? Yes No
What changes have been made?

The City adjusts the prioritization of catch basins for cleaning annually based on accumulation of material. Screens on catch basin inlets have reduced the frequency of necessary catch basin cleaning.

- q) Did your agency remove trash and debris from open channel storm drains a minimum of once per year before the storm season? Yes No
- r) How did your agency minimize the discharge of contaminants during MS4 maintenance and clean outs?

The City's Public Works team used a vacuum and sewer cleaning truck during normal maintenance inspections. The cleaning system uses high pressure and low flow of water to remove and capture contaminants from the MS4. Field crews also control water flow in the area and dam the catch basins to prevent any runoff from maintenance activities.

- s) Where is removed material disposed of?

Trash waste and green waste was collected by Waste Management Inc. and sent to Puente Hills Landfill for disposal or recycling. Cement and asphalt waste was sent to Blue Diamond Crushing Plant for recycling. Liquid waste collected from City clarifiers was removed by Safety Kleen for recycling or disposal.

6. Streets and Roads Maintenance

a) Did your agency designate streets and/or street segments within its jurisdiction as one of the following:

(1) Priority A – streets and/or street segments that are designated as consistently generating the highest volumes of trash and/or litter? Yes No

(2) Priority B - streets and/or street segments that are designated as consistently generating moderate volumes of trash and/or litter? Yes No

(3) Priority C – streets and/or street segments that are designated as generating low volumes of trash and/or litter? Yes No

b) Did your agency perform all street sweeping in compliance with the permit and according to the following schedule:

(1) Priority A – These streets and/or street segments shall be swept at least two times per month? Yes No

(2) Priority B - Each Permittee shall ensure that each streets and/or street segments is cleaned at least once per month? Yes No

(3) Priority C – These streets and/or street segments shall be cleaned as necessary but in no case less than once per year? Yes No

- c) Did your agency require that saw cutting wastes be recovered and disposed of properly and that in no case shall waste be left on a roadway or allowed to enter the storm drain? Yes No
- d) Did your agency require that concrete and other street and road maintenance materials and wastes be managed to prevent pollutant discharges? Yes No
- e) Did your agency require that the washout of concrete trucks and chutes only occur in designated areas and never into storm drains, open ditches, streets, or catch basins leading to the storm drain system? Yes No
- f) Did your agency train its employees in targeted positions (whose interactions, jobs, and activities affect storm water quality) regarding the requirements of the storm water management program to:
- (1) Promote a clear understanding of the potential for maintenance activities to pollute storm water? and Yes No
- (2) Identify and select appropriate BMPs? Yes No

7. Parking Facilities Management

- a) Did your agency ensure that Permittee-owned parking lots be kept clear of debris and excessive oil buildup and cleaned no less than 2 times per month and/or inspected no less than 2 times per month to determine if cleaning is necessary. Yes No
- b) Were any Permittee-owned parking lots cleaned less than once a month? Yes No
How many? **N/A**

8. Public Industrial Activities Management

a) Did your agency, for all municipal activity considered an industrial activity under USEPA Phase I storm water regulations, obtain separate coverage under the State of California General Industrial Activities Storm Water Discharge Permit no later than December 31, 2001? **N/A we do not have any municipal activities considered industrial under USEPA Phase I.**

N/A

Yes No

b) Does your agency serve a population of less than 100,000 people?

Yes No

9. Emergency Procedures

a) In case of real emergencies, did your agency repair essential public services and infrastructure in a manner to minimize environmental damage?

Yes No

b) Were BMPs implemented to the extent that measures did not compromise public health and safety?

Yes No

10. Feasibility Study

a) Did your agency cooperate with the County Sanitation Districts of Los Angeles County to prepare a study which investigates the possible diversion of dry weather flows or the use of alternative treatment control BMPs?

Yes No

b) Did your agency review its individual prioritized list and create a watershed based priority list of drains for potential diversion and submit a listing of priority diversions to the Regional Board Executive Officer?

Yes No

F. Illicit Connections and Illicit Discharges (IC/ID) Elimination Program (Part 4.G)

1. Attach a copy of your agency's IC/ID Elimination Implementation Program (Part 4.G.1.a.). **The City of Manhattan Beach has implemented the SQMP requirements as outlined in the County of Los Angeles NPDES permit requirements. We use the model programs available on the Los Angeles County website. http://www.ladpw.org/wmd/NPDES/model_links.cfm** along with the City's Sewer Overflow Response Plan for responding to all reports of illicit discharge.
2. Attach a map of your storm drain system showing all permitted connections (if available), and the locations of all illicit connections and discharges that occurred last year (Part 4.G.1.b). If your agency has not completed this requirement, describe the status of the development of a baseline map, including an expected completion date.

See attached

3. Describe your enforcement procedures for eliminating illicit discharges and terminating illicit connections.

Process:

1. **Identify source of discharge and/or illicit connection and, if appropriate, film using the city's video camera.**
2. **Immediately notify the offender of the problem and request that they clean up the illicit discharge and, if and illicit connection is also discovered, notify that that connection must be terminated or be approved (permitted) by the city and county. Initial notification is given in person to the offending party at the discharge site, then through letter and/or phone calls. Additionally, a violation warning or citation may also be issued.**
3. **The city's maintenance staff assists with or monitors the cleanup of the illicit discharge.**
4. **Staff performs their assessment within 21 days. This assessment includes locating the source of runoff and making a determination regarding the legality of the connection.**

All illicit connections are then terminated within 180 days and findings are documented for future enforcement actions, if appropriate.

4. Describe your record keeping system to document all illicit connections and discharges.

The City's Utility Manager keeps an Excel spreadsheet log of all illicit connections identified during the course of the year. This log includes the location of the connections, the test conducted to determine the extent of the problem (usually a smoke test), the requested remedy, due date, and status. The locations are shared with the GIS Analyst who then plots the information on a map. The City's Management Analyst keeps an Excel spreadsheet log of all illicit discharges identified during the course of the year. This log includes the location of the discharge, the type of discharge, the action taken to address the discharge, and contact information for the responsible party.

5. What is the total length of open channel that your agency owns and operates? **550 feet**
6. What length was screened last year for illicit connections? **0 - completed in prior year**
7. What is the total length of closed storm drain that your agency owns and operates? **18 miles**
8. What length was screened last year for illicit connections? **0 - completed in prior year**
9. Describe the method used to screen your storm drains.

During the course of the 5-year NPDES permit, City Public Works hired an outside contractor to video screen high priority drains for illicit connections and overall condition. Suspect connections were smoke tested to discover the source. City Public Works staff also screen the storm drains during their regular annual cleaning activities and continually field screen for problems that would be indicated by situations such as sink holes.

10. Provide the reporting data for illicit connections as suggested in the following table (you may submit a spreadsheet from your database that contains the information).

Year	Total # reported/ identified	Total # investigated	# that conveyed exempt discharges or NPDES permitted	# that conveyed illicit discharges that were terminated	# that were removed	# that resulted in enforcement action	# that resulted in <i>other</i> actions
01/02	0	0	0	0	0	0	0
02/03	0	0	0	0	0	0	0
03/04	0	0	0	0	0	0	0
04/05	1	1	0	0	0	0	0
05/06	0	0	0	0	0	0	0
06/07	0	0	0	0	0	0	0
07/08	0	0	0	0	0	0	0
08/09	0	0	0	0	0	0	0
09/10	0	0	0	0	0	0	0
10/11	0	0	0	0	0	0	0
11/12	0	0	0	0	0	0	0

11. Explain any *other* actions that occurred in the last year.

12. What is the average time it takes your agency to initiate an illicit connection investigation after it is reported? **15-60 minutes**

a) Were all identified connections terminated within 180 days? **N/A no identified connections** Yes No

b) If not, explain why.

N/A

13. Provide the reporting data for illicit discharges as suggested in the following table (you may submit a spreadsheet from you database that contains this information).

Year	Total # reported	Total # that were discontinued/ cleaned up voluntarily through enforcement and the source was identified	# that were cleaned up but the source could not be identified	# that resulted in no evidence of discharge to storm drain system	# that were determined to be conditionally exempt	# that were exempt or in compliance and the source identified	# that resulted in enforcement action
01/02	7	7	0	0	0	0	N/A
02/03	8	8	0	8	0	0	0
03/04	13	13	0	13	0	0	3
04/05	29	28	1	28	0	0	7
05/06	32	32	3	32	0	0	8
06/07	27	26	1	4	0	0	11
07/08	18	16	2	2	0	0	8
08/09	8	8	0	4	0	0	1
09/10	3	3	0	2	0	0	0
10/11	37	37	0	13	0	0	0
11/12	3	3	0	0	0	0	0

14. What is the average response time after an illicit discharge is reported? **15 minutes (30-45 after hours)**

a) Did any response times exceed 72 hours? Yes No

b) If yes, explain why.

N/A

15. Describe the your agency's spill response procedures.

Staff follows the same procedures described in the Sewer Overflow Response Plan for illicit discharge incidents considered "spills". For those that do not require public works staff involvement the following procedures apply: Dispatch a Police Code Enforcement Officer to the site in question. CEO performs a site inspection, questions the offending party and immediately request the clean up and further prevention of contaminant runoff. The CEO then monitors the site until cleanup activities are completed. The Police Code Enforcement Officer either serves a warning or a Notice of Violation.

16. What would you do differently to improve your agency's IC/ID Elimination Program?

The City anticipates revising the program with the next permit adoption.

17. Attach a list of all permitted connections to your storm sewer system.
N/A, no permitted connections.

V. Monitoring

Briefly describe any storm water monitoring activities that are not required by Order No. 01-182 that your municipality conducted, participated in, or received funding to conduct in the past fiscal year. These activities should correspond with the dollar amount you listed in Table 2.

We have implemented a coordinated shoreline monitoring plan, along with the other responsible agencies, for the Santa Monica Bay Beaches Bacteria TMDL. There are 3 locations in Manhattan Beach that are monitored for indicator bacteria levels.

VI. Assessment of Program Effectiveness

- A. Attach a summary of the effectiveness of your storm water management program. This summary should include, at a minimum, the following:
(see attached)
1. An assessment of your agency's compliance with permit requirements, based on your responses to the questions in this form;
 2. Descriptions of any evaluation methods that your agency uses to determine the effectiveness of your storm water management program;
 3. A summary of the strengths and weaknesses of your agency's storm water management program;
 4. A list of specific program highlights and accomplishments;
 5. A description of water quality improvements or degradation in your watershed over the past fiscal year;
 6. Interagency coordination between cities to improve the storm water management program;
 7. Future plans to improve your agency's storm water management program; and
 8. Suggestions to improve the effectiveness of your program or the County model programs.
- B. On a scale of 1 to 10 (10 being full implementation of requirements by their deadlines), rate your municipality's level of compliance with Order No. 01-182.
10
- C. List any suggestions your agency has for improving program reporting and assessment.

ATTACHMENT H-6

Los Angeles County Municipal Storm Water Permit (Order 01-182)

Individual Annual Report Form

Attachment U-4

This form summarizes the requirements in Order No. 01-182. Each Permittee must complete this form in its entirety, except for those requirements applicable only to the Principal Permittee. Only report activities that were performed during the previous fiscal year. Upon completion, this form shall be submitted to the Principal Permittee, by the date specified by the Principal Permittee, for inclusion in the unified Annual Storm Water Program Report. Attachments should be included where necessary to provide sufficient information on program implementation.

The goals of this Report are to: 1) concisely document implementation of the Storm Water Quality Management Program (SQMP) during the past fiscal year; 2) evaluate program results for continuous improvement; 3) to determine compliance with Order 01-182; and 4) to share this information with other Permittees, municipal decision makers, and the public.

!	YOU MUST FILL OUT ALL THE INFORMATION REQUESTED <i>Do not leave any of the sections blank.</i>
N/A	If the question does not apply to your municipality, please indicate N/A in the space provided and provide a brief explanation
U	If the information requested is currently unavailable, please indicate U in the space provided and give a brief explanation.

This Report Form consists of the following sections:

SECTION	PAGE
I. Program Management	2-4
II. Receiving Water Limitations	5
III. SQMP Implementation	5-7
IV. Special Provisions	8
IV.A. Public Information and Participation Program	8-16
IV.B. Industrial/Commercial Facilities Program	17-20
IV.C. Development Planning Program	21-24
IV.D. Development Construction Program	25-27
IV.E. Public Agency Activities Program	27-36
IV.F. IC/ID Elimination Program	37-40
V. Monitoring	41
VI. Assessment of Program Effectiveness	41-42
VII. Certification	Separate Attachment

Los Angeles County Municipal Storm Water Permit (Order 01-182)

Individual Annual Report Form

Attachment U-4

Reporting Year 2011 - 2012

I. Program Management

- A. Permittee Name: City of Norwalk
- B. Permittee Program Supervisor: Dan Garcia
 Title: City Engineer
 Address: 12700 Norwalk Blvd
 City: Norwalk Zip Code: 90650
 Phone: 562-929-5727 Fax: 562-929-5584
- C. In the space below, briefly describe how the storm water program is coordinated within your agency's departments and divisions. Include a description of any problems with coordination between departments. To facilitate this, complete the Table 1.

The City Engineer is responsible for the implementation and coordination of the City's Stormwater Quality Management Program. The City Engineer collects and distributes program information, directs departmental activities and serves as the contact point for city contractors, consultants (including site visit inspections), Los Angeles County (Principal Permittee) and other co-permittees. The City's Administration Department coordinates the outreach and public education activities as well as being responsible for managing the trash collection contract. Additional business facility inspections are conducted by the Property Maintenance Division. Building and Construction permits are issued by Building & Safety (private property) and Engineering (public property). IC/IDs are investigated by the Property Maintenance inspectors. Street sweeping is performed under a contract administered by the Public Services Department. All catch basins are cleaned at least annually by the county's contractor and any additional cleaning needed is conducted by the City Contractor which is also under the Public Services Department. Spill response is handled by Public Services with assistance from the County Fire (Haz Mat) Dept. New Development projects are reviewed by the Planning and Engineering Divisions and applicable BMP and SUSMP requirements are applied.

TABLE 1 - Program Management

Storm Water Management Activity	Division/Department	# of Individuals Responsible for Implementing
1. Outreach & Education	Administration	1
2. Industrial/Commercial Inspections (site visits)	Engineering	Consultant
3. Construction Permits/Inspections	Building & Safety and Engr. Div	4
4. IC/ID Inspections	Building & Safety	2
5. Street sweeping	Public Services	1+contractor
6. Catch Basin Cleaning	Public Services	1+contractor
7. Spill Response	Public Services	3+County
8. Development Planning (SUSMP) review and approval)	Planning/Engineering and Building & Safety	3
9. Trash Collection	Administration	1+contractor

Los Angeles County Municipal Storm Water Permit (Order 01-182)

Individual Annual Report Form

Attachment U-4

D. Staff and Training

Attach a summary of staff training over the last fiscal year. This shall include the staff name, department, type of training, and date of training.

Training is conducted on an annual basis with informal training occurring throughout the year. The most recent training sessions were conducted on 6/13/2012 and 7/10/2012. See attached.

E. Budget Summary

1. Does your municipality have a storm water utility? Yes No

If no, describe the funding source(s) used to implement the requirements of Order No. 01-182.

<p>General fund with limited assistance from the Used Oil Fund.</p>

2. Are the existing financial resources sufficient to accomplish all required activities? Yes No

Funding for the required activities of this unfunded State mandate necessitated reductions in funding for other City services, programs and capital projects.

3. Complete Table 2 to the extent that accurate information is available (indicate U in the spaces where the information is unavailable), and report any supplemental dedicated budgets for the same categories on the lines below the table.

4. List any additional state/federally funded projects related to storm water.

<p>N/A</p>

Los Angeles County Municipal Storm Water Permit (Order 01-182)

Individual Annual Report Form

Attachment U-4

Program Element	Expenditures in Fiscal Year 2011-2012	Estimated Amount Needed to implement Order 01-182
1. Program management a. Administrative costs b. Capital costs	\$13,100	\$616,033
2. Public Information and Participation a. Public Outreach/Education b. Employee Training c. Corporate Outreach d. Business Assistance	\$7,840	\$ 88,364
3. Industrial/Commercial inspection/ site visit activities	\$ 2,832	\$154,000
4. Development Planning	\$3,830	\$88,502
5. Development Construction a. Construction inspections	\$2,100	\$88,161
6. Public Agency Activities a. Maintenance of structural and treatment control BMPs including Transportation center GIASP and water wells b. Municipal street sweeping c. Catch basin cleaning d. Trash collection/recycling e. Capital costs	a. \$39,100 b. \$655,000 c. \$1,500 d. Not tracked by city	\$1,280,000 \$4,026,000 \$63,470 N/A \$200,000
7. IC/ID Program a. Operations and Maintenance b. Capital Costs	a. \$1,030 b. \$	\$49,722
8. Monitoring	by LA County	\$0
9. Other TMDL	\$5,000	\$0
10. TOTAL	\$ 731,000	\$ 6,654,252

List any supplemental dedicated budgets for the above categories:

--

List any activities that have been contracted out to consultants/other agencies:

Site visits (inspections) - consultant Catch Basin cleaning - county Trash hauling - contractor Street sweeping -contractor
--

Los Angeles County Municipal Storm Water Permit (Order 01-182)

Individual Annual Report Form

Attachment U-4

II. Receiving Water Limitations (Part 2)

- A. Are you aware, or have you been notified, of any discharges from your MS4 that cause or contribute to a condition of nuisance or to the violation of any applicable water quality standards? Yes No
- B. Has the Regional Board notified you that discharges from your MS4 are causing or contributing to an exceedance of water quality standards? Yes No
- C. If you answered Yes to either of the above questions, you must attach a Receiving Water Limitations (RWL) Compliance Report. The Report must include the following:
1. A description of the pollutants that are in exceedance and an analysis of possible sources;
 2. A plan to comply with the RWL (Permit, Part 2);
 3. Changes to the SQMP to eliminate water quality exceedances;
 4. Enhanced monitoring to demonstrate compliance; and
 5. Results of implementation.

III. SQMP Implementation (Part 3)

- A. Has your agency implemented the SQMP and any additional controls necessary to reduce the discharges of pollutants in storm water to the maximum extent practicable? Yes No
- B. If your agency has implemented additional or different controls than described in the countywide SQMP, has your agency developed a local SQMP that reflects the conditions in its jurisdiction and specifies activities being implemented under the appropriate elements described in the countywide SQMP? Yes No
- C. Describe the status of developing a local SQMP in the box below.

The City follows the Countywide SQMP.

Los Angeles County Municipal Storm Water Permit (Order 01-182)

Individual Annual Report Form

Attachment U-4

- D. If applicable, describe an additional BMP, in addition to those in the countywide SQMP, that your city has implemented to reduce pollutants in storm water to the maximum extent practicable.

N/A

- E. Watershed Management Committees (WMCs)

- 1. Which WMC are you in?
San Gabriel River Watershed
- 2. Who is your designated representative to the WMC?
John L. Hunter & Associates
- 3. How many WMC meetings did you participate in last year?
All meetings were attended
- 4. Describe specific improvements to your storm water management program as a result of WMC meetings.

The San Gabriel River Watershed Management Committee meetings provide a valuable opportunity for the exchange of ideas and discussion of pertinent issues.

- 5. Attach any comments or suggestions regarding your WMC.
None at this time

- F. Storm Water Ordinance

- 1. Have you adopted a storm water and urban runoff ordinance to enforce all requirements of Order 01-182? Yes No
If not, describe the status of adopting such an ordinance.

N/A

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

2. If yes, have you already submitted a copy of the ordinance to the Regional Board? Yes No
If not, please attach a copy to this Report.
3. Were any amendments made to your storm water ordinance during the last fiscal year? Yes No
If yes, attach a copy of amendments to this Report.

G. Discharge Prohibitions

1. List any non-storm water discharges you feel should be further regulated:

None at this time

2. List any non-storm water discharges you feel should be exempt, and provide an explanation for each:

None at this time

Los Angeles County Municipal Storm Water Permit (Order 01-182)

Individual Annual Report Form

Attachment U-4

IV. Special Provisions (Part 4)

A. Public Information and Participation (Part 4.B)

In addition to answering the following questions, attach a summary of all storm water education activities that your agency conducted or participated in last year.

1. No Dumping Message

a) How many storm drain inlets does your agency own? 58

b) How many storm drain inlets were marked with a no dumping message in the last fiscal year? Completed in a previous reporting cycle and re-stenciled as necessary

c) What is the total number of storm drain inlets that are legibly marked with a no dumping message? 58

If this number is less than the number in question 1.b, describe why all inlets have not been marked, the process used to implement this requirement, and the expected completion date.

The County re-stencils as needed as part of their clean-out activities

d) How many public access points to creeks, channels, and other water bodies within your jurisdiction have been posted with no dumping signage in the past year? N/A

Describe your agency's status of implementing this requirement by the date required in Order No. 01-182.

No City owned access points.

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

2. Reporting Hotline

- a) Has your agency established its own hotline for reporting and for general storm water management information? Yes No
- b) If so, what is the number? Day time number is (562) 929-5727
- c) Is this information listed in the government pages of the telephone book? Yes No
- d) If no, is your agency coordinated with the countywide hotline? Yes No
- e) Do you keep record of the number of calls received and how they were responded to? Yes No

f) How many calls were received in the last fiscal year?

N/A

g) Describe the process used to respond to hotline calls.

The caller's information (name, date, time etc.) is recorded on a standard city form. The report is forwarded to the appropriate department.

h) Have you provided the Principal Permittee with your current reporting contact information? Yes No

i) Have you compiled a list of the general public reporting contacts for all Permittees and posted it on the www.888CleanLA.com web site (Principal Permittee only)? Yes No

If not, when is this scheduled to occur? N/A

3. Outreach and Education

a) Describe the strategy developed to provide outreach and bilingual materials to target ethnic communities. Include an explanation of why each community was chosen as a target, how program effectiveness will be determined, and status of implementation. (Principal Permittee only)

N/A

Los Angeles County Municipal Storm Water Permit (Order 01-182)

Individual Annual Report Form

Attachment U-4

b) Did the Principal Permittee organize quarterly Public Outreach Strategy meetings that you were aware of? Yes No

How many Public Outreach Strategy meetings did your agency participate in last year? 4- JLHA attended all

Explain why your agency did not attend any or all of the organized meetings.

N/A

Identify specific improvements to your storm water education program as a result of these meetings:

The City received updates from the county and would consider those into making outreach planning in the upcoming fiscal year.

List suggestions to increase the usefulness of quarterly meetings:

None at this time

If quarterly Public Outreach Strategy meetings were not organized, explain why not and when this requirement will be implemented (Principal Permittee only).

N/A

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

- c) Approximately how many impressions were made last year on the general public about storm water quality via print, local TV, local radio, or other media?

A stormwater pollution prevention during rainy season reminder was published in the city's newspaper "Norwalk Now" in November. Total impressions would be about 30,000.

- d) Describe efforts your agency made to educate local schools on storm water pollution.

The city reached out to all 5th grade school teachers with environmental wall calendars and encourage schools to be more environmentally concerned. In addition, presentations and materials were available to local schools upon request.

- e) Did you provide all schools within each school district in Los Angeles County with materials necessary to educate a minimum of 50 percent of all school children (K-12) every 2 years on storm water pollution (*Principal Permittee only*)? Yes No
If not, explain why.

N/A

- f) Describe the strategy developed to measure the effectiveness of in-school educational programs, including assessing students' knowledge of storm water pollution problems and solutions before and after educational efforts (*Principal Permittee only*).

N/A

For Permit Years 2-5, attach an assessment of the effectiveness of in-school storm water education programs.

Los Angeles County Municipal Storm Water Permit (Order 01-182)

Individual Annual Report Form

Attachment U-4

- g) What is the behavioral change target that was developed based on sociological data and other studies (*Principal Permittee only*)?

N/A

If no target has been developed, explain why and describe the status of developing a target.

N/A

What is the status of meeting the target by the end of Year 5?

N/A

4. Pollutant-Specific Outreach

- a) Attach a description of each watershed-specific outreach program that your agency developed (*Principal Permittee only*). All pollutants listed in Table 1 (Section B.1.d.) must be included.
- b) Did your agency cooperate with the Principal Permittee to develop specific outreach programs to target pollutants in your area? Yes No
- c) Did your agency help distribute pollutant-specific materials in your city? Yes No
- d) Describe how your agency has made outreach material available to the general public, schools, community groups, contractors and developers, etc...

The city places informational materials at the City Hall counters, and from time to time includes stormwater program information in the city's newspaper.

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

5. Businesses Program

- a) Briefly describe the Corporate Outreach Program that has been developed to target gas stations and restaurant chains (*Principal Permittee only*).

N/A

- b) How many corporate managers did your agency (*Principal Permittee only*) reach last year? N/A

- c) What is the total number of corporations to be reached through this program (*Principal Permittee only*)? N/A

- d) Is your agency meeting the requirement of reaching all gas station and restaurant corporations once every two years (*Principal Permittee only*)? N/A Yes No

If not, describe measures that will be taken to fully implement this requirement.

The city of Norwalk implemented its restaurant outreach program by sending a mailer to local restaurant owners. The annual outreach targets all restaurants with an emphasis on sidewalk, patio and parking lot cleaning and maintenance. 57 restaurants were reached during this reporting period.

- e) Has your agency developed and/or implemented a Business Assistance Program? Yes No

If so, briefly describe your agency's program, including the number of businesses assisted, the type of assistance, and an assessment of the program's effectiveness.

Several BMP pamphlets are available, including a brochure (also a mailer) "A Business Guide to Stormwater Pollution Prevention" addressing proper BMPs compliance to business owners. The brochure/mailer was also made available to send out to businesses with violations or complaint.

Los Angeles County Municipal Storm Water Permit (Order 01-182)

Individual Annual Report Form

Attachment U-4

6. Did you encourage local radio stations and newspapers to use public service announcements? Yes No

If yes, How many media outlets were contacted?
Which newspapers or radio stations ran them?

The city's monthly newspaper "Norwalk Now" constantly publishes stormwater or environmental news and program updates.

Who was the audience?

Residents and businesses

7. Did you supplement the County's media purchase by funding additional media buys? Yes No

Estimated dollar value/in-kind contribution: N/A
Type of media purchased: N/A
Frequency of the buys: N/A

Did another agency help with the purchase? Yes No

8. Did you work with local business, the County, or other Permittees to place non-traditional advertising? Yes No

If so, describe the type of advertising.

Stormwater educational information is made available at the city department counter.

9. Did you establish local community partnerships to distribute educational storm water pollution prevention material? Yes No

Describe the materials that were distributed:

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

The city distributed outreach material developed for general industrial, commercial facilities, automotive services facilities and restaurants during site visits and inspections. The city also distributed program information via local events.

Who were the key partners? The business community
Who was the audience (businesses, schools, etc.)?

General public and businesses

10. Did you participate in or publicize workshops or community events to discuss storm water pollution? Yes No

How many events did you attend? 1
Rabies Clinic Event (June 7, 2011)

11. Does your agency have a website that provides storm water pollution prevention information? Yes No
If so, what is the address?

The city has linked its website to the County environmental website:
www.888cleanLA.com

12. Has awareness increased in your community regarding storm water pollution? Yes No
Do you feel that behaviors have changed? Yes No

Explain the basis for your answers. Include a description of any evaluation methods that are used to determine the effectiveness of your agency's outreach.

No scientific or statistical surveys have been conducted, while out at events. The public's overall understanding and awareness of the program has been steadily increasing.

13. How would you modify the storm water public education program to improve it on the City or County level?

No suggestions at this time.

Los Angeles County Municipal Storm Water Permit (Order 01-182)

Individual Annual Report Form

Attachment U-4

B. Industrial/Commercial Facilities Program

1. Critical Source Inventory Database

Did you (individually or jointly) update the Database for Critical Sources Inventory? Yes No

Comments/Explanation/Conclusion:

During the 2011-12 reporting year, the database was updated using information collected by the City inspectors and using information supplied by the city's business license Department.
--

2. Inspection Program

Provide the reporting data as suggested in the following tables.

Category	Initial Number of Facilities at the start of cycle proposed for inspection by categories (after the initial year, the updated number based on the new data)	Number of facilities inspected in the current reporting year	% Completed at the time of this report for present cycle (from the initial value, and from the updated value after first cycle)	Total number since permit adoption
Industrial/Commercial	Although there is currently no reporting cycle. The city has continued inspections.	4	100% (Completed during previous reporting cycle)	169
Automotive	Although there is currently no reporting cycle. The city has continued inspections.	14	100% (Completed during previous reporting cycle)	150
Restaurants	Although there is currently no reporting cycle. The city has continued inspections.	25	100% (Completed during previous reporting cycle)	226

Comments/Explanation/Conclusion:

The City of Norwalk completed the required 2nd round of inspections for industrial/commercial facilities before the December 12, 2006 deadline. The City has exceeded permit requirements by continuing to conduct industrial/commercial and restaurant inspections. During FY 2011-2012, the City completed a total of 43 industrial/commercial, automotive, and restaurant inspections.

Los Angeles County Municipal Storm Water Permit (Order 01-182)

Individual Annual Report Form

Attachment U-4

3. BMPs Implementation

Provide the reporting data as suggested in the following table.

Category	Number of facilities inspected by category in this reporting year	Number of facilities identified as adequately implementing BMPs as specified in this reporting year	% adequately implementing out of total in this reporting year	Number of facilities required to implement or upgrade in this reporting year	Number of facilities inspected by category in this reporting cycle	Number of facilities identified as adequately implementing BMPs as specified in this reporting cycle	% adequately implementing out of total in this reporting cycle	Number of facilities required to implement or upgrade in this reporting cycle	Total Number during this permit adequately implementing	Total Number during this permit required to implement or upgrade
Industrial/Comm	4	4	100%	0	N/A – Currently no reporting cycle.	N/A – Currently no reporting cycle.	N/A – Currently no reporting cycle.	N/A – Currently no reporting cycle.	N/A – Currently no reporting cycle.	N/A – Currently no reporting cycle.
Auto.	14	14	100%	0	N/A – Currently no reporting cycle.	N/A – Currently no reporting cycle.	N/A – Currently no reporting cycle.	N/A – Currently no reporting cycle.	N/A – Currently no reporting cycle.	N/A – Currently no reporting cycle.
Rest.	25	23	92%	2	N/A – Currently no reporting cycle.	N/A – Currently no reporting cycle.	N/A – Currently no reporting cycle.	N/A – Currently no reporting cycle.	N/A – Currently no reporting cycle.	N/A – Currently no reporting cycle.

Comments/Explanation/Conclusion:

The City of Norwalk has completed all 1st and 2nd cycle inspections in compliance with the permit. The City has exceeded permit requirements by continuing to inspect approximately 20% of all Industrial/Commercial facilities and Restaurants during the permit extension.

Los Angeles County Municipal Storm Water Permit (Order 01-182)

Individual Annual Report Form

Attachment U-4

4. Enforcement Activities

Provide the reporting data as suggested in the following tables.

Enforcement Actions by categories (e.g. Warning letter, NOV, referral to D.A., etc.)	Number of facilities issued enforcement actions in the current reporting year	Number of facilities issued enforcement actions in the current reporting cycle	Number of facilities (re)inspected due to enforcement actions in current reporting year	Number of facilities (re)inspected due to enforcement actions in current reporting cycle	Number of facilities brought into compliance in the current reporting year	Number of facilities brought into compliance in current reporting cycle	Total number of enforcement actions since permit adoption (by category)
Verbal Warning	2	N/A	2	N/A	2	N/A	N/A
NOV	0	N/A	N/A	N/A	N/A	N/A	N/A

*Verbal Warnings are generally corrected while inspector is onsite; therefore, no re-inspection is necessary.

Facilities by category	Number of Warning letters	Number of NOVs	Number of Referral	Number of follow up inspections
Indust./Comm.	0	0	0	0
Automotive	0	0	0	0
Restaurants	0	0	0	2
Comments/Explanation/Conclusion:		N/A		

Los Angeles County Municipal Storm Water Permit (Order 01-182)**Individual Annual Report Form****Attachment U-4**

5. Program Implementation Effectiveness Assessment

Please give a brief assessment of the implementation of the program in removing pollutants from the storm water discharges. Please provide an explanation. Suggested improvements or adjustments based on the knowledge gained through this reporting period activities must be reflected in a change in the SQMP, if warranted.

Highly Effective Somewhat Effective Non-effective

Comments/Explanation/Conclusion:

The overall understanding and support has increased since the start of the program. Outreach materials distributed during routine site inspections help open discussion of necessary BMP's and the reasons why they need to be implemented. Facility owners, managers and staff generally respond well to inspectors' requests for changes in operations to meet requirements for compliance.

6. You must also submit a quarterly electronic submittal of your Industrial/Commercial Facilities Program activities. The principle permittee has informed us that they are not accepting this information at this time.

Los Angeles County is not accepting this information at this time.

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

C. Development Planning Program (Part 4.D)

1. Does your agency have a process to minimize impacts from storm water and urban runoff on the biological integrity of natural drainage systems and water bodies in accordance with requirements under CEQA, Section 404 of the CWA, local ordinances, and other legal authorities? Yes No

Attach examples showing how storm water quality impacts were addressed in environmental documents for projects over the past year.

2. Does your agency have procedures to include the following requirements in all priority development and redevelopment projects:

- a) Maximize the percentage of permeable surfaces to allow more percolation of storm water into the ground? Yes No

- b) Minimize the quantity of storm water directed to impermeable surfaces and the MS4? Yes No

- c) Minimize pollution emanating from parking lots through the use of appropriate treatment control BMPs and good housekeeping practices? Yes No

- d) Provide for appropriate permanent measures to reduce storm water pollutant loads from the development site? Yes No

3. List the types and numbers of BMPs that your agency required for priority projects to meet the requirements described above.

1- Biofiltration (1)
2- capture and reuse (1)

4. Describe the status of the development or implementation of peak flow controls in Natural Drainage Systems.

N/A

Los Angeles County Municipal Storm Water Permit (Order 01-182)

Individual Annual Report Form

Attachment U-4

5. Has your agency amended codes and/or ordinances to give legal effect to the SUSMP changes required in the Permit? Yes No

6. Describe the process your agency uses to include SUSMP design standards in new development and redevelopment project approvals.

Requirements are added to projects through conditions of approval. Due in part to the economic downturn, no projects meeting the SUSMP threshold were reviewed by the city in this reporting period.

7. How many of each of the following projects did your agency review and condition to meet SUSMP requirements last year?

- a) Residential
- b) Commercial 1
- c) Industrial
- d) Automotive Service Facilities
- e) Retail Gasoline Outlets
- f) Restaurants
- g) Parking Lots
- h) Projects located in or directly adjacent to or discharging directly to an environmentally sensitive area
- i) Total number of permits issued to priority projects 1

8. What is the percentage of total development projects that were conditioned to meet SUSMP requirements? Less than 1%

9. How has your agency prepared to reduce the SUSMP threshold for industrial/commercial facilities to 1 acre from 100,000 square feet in 2003?

Previously implemented.

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

10. After 2003, how many additional projects per year will require/did require implementation of SUSMP requirements as a result of the lower threshold? 5-10
11. Does your agency participate in an approved regional or sub-regional storm water mitigation program to substitute in part or wholly SUSMP requirements for new development? Yes No
12. Has your agency modified its planning procedures for preparing and reviewing CEQA documents to consider potential storm water quality impacts and provide for appropriate mitigation? Yes No

If no, provide an explanation and an expected date of completion.

13. Did your agency update any of the following General Plan elements in the past year?
- a) Land Use Yes No
 - b) Housing Yes No
 - c) Conservation Yes No
 - d) Open Space Yes No

If yes, please describe how watershed and storm water quality and quantity management considerations were included.

No significant updates to the General Plan elements were prepared in the 2011-2012 reporting year.

Los Angeles County Municipal Storm Water Permit (Order 01-182)**Individual Annual Report Form****Attachment U-4**

14. How many targeted staff were trained last year? 39
15. How many targeted staff are trained annually? 39-40
16. What percentage of total staff are trained annually? 90-100%
17. Has your agency developed and made available development planning guidelines? Yes No
18. If no, what is the expected date that guidelines will be developed and available to developers? N/A
19. What is the status of completion of the technical manual for siting and design of BMPs for the development community?

The County has taken the lead on this project.

Los Angeles County Municipal Storm Water Permit (Order 01-182)

Individual Annual Report Form

Attachment U-4

D. Development Construction Program

1. Describe your agency's program to control runoff from construction activity at all construction sites within its jurisdiction.

- Erosion control plans are required as part of the grading permit application.
- Erosion control measures are required to be in place for grading between October 15th and April 15th of each year
- Inspection of grading sites includes review of erosion control measures
- Inspection of grading sites after rainstorms.

2. Does your agency require the preparation, submittal, and implementation of a Local Storm Water Pollution Prevention Plan (Local SWPPP) prior to the issuance of a grading permit for all sites that meet one or all of the following criteria?

- a) Will result in soil disturbance of one acre or greater Yes No
- b) Is within, directly adjacent to, or is discharging directly to an environmentally sensitive area Yes No
- c) Is located in a hillside area N/A Yes No

3. Attach one example of a local SWPPP
See previous annual reports.

4. Describe the process your agency uses to require proof of filing a Notice of Intent for coverage under the State General Construction Activity Storm Water permit and a certification that a SWPPP has been prepared prior to issuing a grading permit?

A copy of the NOI and copy of the SWPPP is required to be submitted prior to issuance of grading or building permits for projects 1 acre or greater. The city also obtains a copy of the letter from the State Water Resources Control Board issuing the WDID number for the project

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

- 5. How many building/grading permits were issued to sites requiring Local SWPPPs last year? LSWPPPs are general Confirm: zero projects with disturbed areas greater than 1 acre 7
- 6. How many building/grading permits were issued to sites requiring coverage under the General Construction Activities Storm Water Permit last year? 4
- 7. How many building/grading permits were issued to construction site less than one acre in size last year? 805
- 8. How many construction sites were inspected during the last wet season? 480
- 9. Complete the table below.

Type of Violation	# of Violations	% of Total Inspections	# of Follow-up Inspections	# of Enforcement Actions
Off-site discharge of sediment	5	1%	5	0
Off-site discharge of other pollutants	0	N/A	0	0
No or inadequate SWPPP	2	<1%	2	0
Inadequate BMP/SWPPP implementation	3	<1%	3	0

- 10. Describe the process for taking enforcement actions against construction site violations, including the types of actions that are taken.

A Notice of Violation is issued upon discovery of a violation, requiring the correction or implementation of BMPs. This correction, clean-up or implementation is required to become the priority activity on the construction site. A stop work notice will be issued if the required actions have not been completed within the specified time frame. Site has the potential to receive citations if further noncompliance continues.

- 11. Describe the system that your agency uses to track the issuance of grading permits.

The city uses a computer based permit tracking system

Los Angeles County Municipal Storm Water Permit (Order 01-182)

Individual Annual Report Form

Attachment U-4

E. Public Agency Activities (Part 4.F)

1. Sewage System Maintenance, Overflow, and Spill Prevention
(only applicable to agencies that own and/or operate a sanitary sewer system)

- a) Has your agency developed and implemented a response plan for sanitary sewer overflows that includes the requirements in Order 01-182? Yes No
- b) How many sanitary sewer overflows occurred within your jurisdiction? 3
- c) How many did your agency respond to? 3
- d) Did your agency investigate all complaints received? Yes No
- e) How many complaints were received? 3
- f) Upon notification, did your agency immediately respond to overflows by containment? Yes No
- g) Did your agency notify appropriate sewer and public health agencies when a sewer overflowed to the MS4? Yes No
- h) Did your agency implement a program to prevent sewage spills or leaks from sewage facilities from entering the MS4? Yes No

If so, describe the program:

The City continues to implement a program to prevent sewerage spills from entering the MS4. The City developed a SSMP to address sanitary sewer overflows.

- i) Did your agency implement a program to identify, repair, and remediate sanitary sewer blockages, exfiltration, overflow, and wet weather overflows from sanitary sewers to the MS4? Yes No

If so, describe the program:

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

The city implemented and continues to implement a program of preventive measures including the following: (1) suspected trouble spots such as pipe segments subject to root intrusion, that are identified by video are identified and cleaned as needed. (2) repeat trouble spots are cleaned twice a year, (3) all lift stations are cleaned out three times a year, (4) the entire sanitary sewer system is cleaned once every 3 years (one third of the system every year).

2. Public Construction Activities Management

a) What percentage of public construction sites 5 acres or greater in size did your agency obtain coverage under the State of California General Construction Activities Storm Water Discharge Permit? N/A %

b) Give an explanation for any sites greater than 5 acres that were not covered:

There are no public projects subject to the State's General Construction Permit during this reporting year.

c) What is the total number of active public construction sites? 2
How many were 5 acres or greater in size? 0

d) (After March, 2003) Did your agency obtain coverage under the State of California General Construction Activities Storm Water Discharge Permit coverage for public construction sites for sites one acre or greater? N/A Yes No

3. Vehicle Maintenance/Material Storage Facilities/Corporation Yards Management

a) Did your agency implement pollution prevention plans for each public vehicle maintenance facility, material storage facility, and corporation yard? Yes No

The Public Services/Transportation Center is operating under the State's General Industrial Permit.

Los Angeles County Municipal Storm Water Permit (Order 01-182)

Individual Annual Report Form

Attachment U-4

b) Briefly describe how your agency implements the following, and any additional, BMPs to minimize pollutant discharges in storm water:

- (1) Good housekeeping practices
- (2) Material storage control
- (3) Vehicle leaks and spill control
- (4) Illicit discharge control

The above listed BMP's are routinely implemented through training of the appropriate personnel. The Pollution Prevention Plan (PPP) for the Public Services/Transportation Center provides guidelines to performing Good Housekeeping practices. Specific BMP's may include:

- Random inspections are conducted.
- There is a designated vehicle wash area discharging to the sanitary sewer.
- Vehicle repair and storage are indoors.

c) Are all Permittee owned and/or operated vehicle/equipment wash areas self-contained, covered, equipped with a clarifier, and properly connected to the sanitary sewer? Yes No
 If not, what is the status of implementing this requirement?

N/A

d) How many Permittee owned and/or operated vehicle/equipment wash areas are scheduled to be redeveloped to include the BMPs listed above? N/A, Previously completed

4. Landscape and Recreational Facilities Management

a) Has your agency developed a standardized protocol for the routine and non-routine application of pesticides, herbicides (including pre-emergents), and fertilizers? Yes No

Briefly describe this protocol:

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

All materials are applied by, or under the direct supervision of, a State licensed Pesticide Certified Advisor and Certified Qualified Applicator. All city applicator personnel and City landscaping contractors have adequate training and supervision to ensure that proper protocols are followed. The City contractor and city staff hold a permit (renewed annually) issued by the L. A. County Ag commissioner. At the beginning of every calendar, the City files a Pesticide Use Recommendation report with the County describing the material and procedures the City plans to implement.

- b) How does your agency ensure that there is no application of pesticides or fertilizers immediately before, during, or immediately after a rain event or when water is flowing off the area to be applied?

This is covered in the training described above.

- c) Are any banned pesticides, herbicides, fungicides, or rodenticides stored or applied in your agency's jurisdiction that you know of?

Yes No

If so, list them:

N/A

- d) What percentage of your agency's staff that apply pesticides are certified by the California Department of Food and Agriculture, or are under the direct supervision of a certified pesticide applicator?

100%

- e) Describe procedures your agency has implemented to encourage retention and planting of native vegetation and to reduce water, fertilizer, and pesticide needs:

The City encourages the use of native vegetation and drought tolerant plants throughout the City.

Los Angeles County Municipal Storm Water Permit (Order 01-182)

Individual Annual Report Form

Attachment U-4

5. Storm Drain Operation and Management

a) Did your agency designate catch basin inlets within its jurisdiction as Priority A; Priority B; and Priority C? Yes No

b) How many of each designation exist in your jurisdiction?

Priority A: 0
Priority B: 0
Priority C: 58 county owned
884 county owned

c) Is your city subject to a trash TMDL? Yes No

d) If yes, describe the activities and/or implementation measures that your agency conducted pursuant to the TMDL and any other trash reduction efforts that occurred.

N/A

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

- e) How many times were all Priority A basins cleaned last year? N/A

- f) How many times were all Priority B basins cleaned last year? N/A

- g) How many times were all Priority C basins cleaned last year? Once a year
Cleaned in Sept 2011.

- h) How much total waste was collected in tons from catch basin clean-outs last year? City owned:
0.33 tons
County owned:
County has this information

- i) Attach a record of all catch basins in your jurisdiction. This shall identify each basin as City or County owned, and Priority A, B, or C. For all basins that are owned and operated by your agency, include dates that each was cleaned out over the past year.
 The County has this information. City has maps.

- j) Did your agency place and maintain trash receptacles at all transit stops within its jurisdiction. Yes No
 The City continued its daily, weekly, and bi-weekly cleaning of the 242 transit stops which included the maintaining of trash receptacles.

- k) How many new trash receptacles were installed last year? 0

- l) Did your agency place special conditions for events that generated substantial quantities of trash and litter including provisions that:
 - (1) Provide for the proper management of trash and litter generated from the event? Yes No

 - (2) Arrange for temporary screens to be placed on catch basins? Yes No

 - (3) Or for catch basins in that area to be cleaned out subsequent to the event and prior to any rain? Yes No

Los Angeles County Municipal Storm Water Permit (Order 01-182)

Individual Annual Report Form

Attachment U-4

m) Did your agency inspect the legibility of the catch basin stencil or labels? Standard procedure by the County contractor Yes No

What percentage of stencils were legible? 100%

n) Were illegible stencils recorded and re-stenciled or re-labeled within 180 days of inspection? Yes No

o) Did your agency visually monitor Permittee-owned open channel storm drains and other drainage structures for debris at least annually and identify and prioritize problem areas of illicit discharge for regular inspection?

Previously conducted Yes No

Is the prioritization attached? N/A

Only one open channel Yes No

p) Did your agency review its maintenance activities to assure that appropriate storm water BMPs are being utilized to protect water quality? Yes No

What changes have been made?

Included in annual staff training. Other changes as necessary.

q) Did your agency remove trash and debris from open channel storm drains a minimum of once per year before the storm season? Yes No

r) How did your agency minimize the discharge of contaminants during MS4 maintenance and clean outs?

The Channel is cleaned approximately quarterly by the city's landscape contractors. The open channel has no usable outlet

s) Where is removed material disposed of?

At a legal point of disposal.

Los Angeles County Municipal Storm Water Permit (Order 01-182)

Individual Annual Report Form

Attachment U-4

6. Streets and Roads Maintenance
- a) Did your agency designate streets and/or street segments within its jurisdiction as one of the following:
- (1) Priority A – streets and/or street segments that are designated as consistently generating the highest volumes of trash and/or litter? N/A
All streets are swept at priority A frequencies Yes No
- (2) Priority B - streets and/or street segments that are designated as consistently generating moderate volumes of trash and/or litter? N/A Yes No
- (3) Priority C – streets and/or street segments that are designated as generating low volumes of trash and/or litter? N/A Yes No
- b) Did your agency perform all street sweeping in compliance with the permit and according to the following schedule:
- (1) Priority A – These streets and/or street segments shall be swept at least two times per month? N/A, All streets are swept at priority A frequencies a minimum of twice per month Yes No
- (2) Priority B - Each Permittee shall ensure that each streets and/or street segments is cleaned at least once per month? N/A Yes No
- (3) Priority C – These streets and/or street segments shall be cleaned as necessary but in no case less than once per year? N/A Yes No

Los Angeles County Municipal Storm Water Permit (Order 01-182)

Individual Annual Report Form

Attachment U-4

- c) Did your agency require that saw cutting wastes be recovered and disposed of properly and that in no case shall waste be left on a roadway or allowed to enter the storm drain? Yes No
- d) Did your agency require that concrete and other street and road maintenance materials and wastes be managed to prevent pollutant discharges? Yes No
- e) Did your agency require that the washout of concrete trucks and chutes only occur in designated areas and never into storm drains, open ditches, streets, or catch basins leading to the storm drain system? Yes No
- f) Did your agency train its employees in targeted positions (whose interactions, jobs, and activities affect storm water quality) regarding the requirements of the storm water management program to:
- (1) Promote a clear understanding of the potential for maintenance activities to pollute storm water? and Yes No
- (2) Identify and select appropriate BMPs? Yes No
7. Parking Facilities Management
- a) Did your agency ensure that Permittee-owned parking lots be kept clear of debris and excessive oil buildup and cleaned no less than 2 times per month and/or inspected no less than 2 times per month to determine if cleaning is necessary. Yes No
- b) Were any Permittee-owned parking lots cleaned less than once a month? Yes No
How many? N/A

Los Angeles County Municipal Storm Water Permit (Order 01-182)

Individual Annual Report Form

Attachment U-4

8. Public Industrial Activities Management
- a) Did your agency, for all municipal activity considered an industrial activity under USEPA Phase I storm water regulations, obtain separate coverage under the State of California General Industrial Activities Storm Water Discharge Permit no later than December 31, 2001? Yes No
- b) Does your agency serve a population of less than 100,000 people? Yes No
9. Emergency Procedures
- a) In case of real emergencies, did your agency repair essential public services and infrastructure in a manner to minimize environmental damage? Yes No
- b) Were BMPs implemented to the extent that measures did not compromise public health and safety? Yes No
10. Feasibility Study
- a) Did your agency cooperate with the County Sanitation Districts of Los Angeles County to prepare a study which investigates the possible diversion of dry weather flows or the use of alternative treatment control BMPs? Yes No
- b) Did your agency review its individual prioritized list and create a watershed based priority list of drains for potential diversion and submit a listing of priority diversions to the Regional Board Executive Officer? N/A Yes No

Los Angeles County Municipal Storm Water Permit (Order 01-182)**Individual Annual Report Form****Attachment U-4**

- F. Illicit Connections and Illicit Discharges (IC/ID) Elimination Program (Part 4.G)
1. Attach a copy of your agency's IC/ID Elimination Implementation Program (Part 4.G.1.a.). The City has adopted and implements the Countywide model program for IC/IDs.
 2. Attach a map of your storm drain system showing all permitted connections (if available), and the locations of all illicit connections and discharges that occurred last year (Part 4.G.1.b). If your agency has not completed this requirement, describe the status of the development of a baseline map, including an expected completion date.

The City does not issue permits for maintaining connections to storm drains.

3. Describe your enforcement procedures for eliminating illicit discharges and terminating illicit connections.

Site is ordered to immediately cease any type of illicit discharge or illicit connection. Site is then instructed to clean up the illicit discharge and/or disconnect the illicit connection. Follow-up inspections are conducted as necessary. Site is required to implement and maintain these permanent corrective measures.

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

4. Describe your record keeping system to document all illicit connections and discharges.

Property Maintenance tracks/maintains a database.

5. What is the total length of open channel that your agency owns and operates? 1,500 ft

6. What length was screened last year for illicit connections? Screened in a previous reporting year.

7. What is the total length of closed storm drain that your agency owns and operates? 16,360 ft

8. What length was screened last year for illicit connections? 0

9. Describe the method used to screen your storm drains.

Completed in a previous reporting cycle.

10. Provide the reporting data for illicit connections as suggested in the following table (you may submit a spreadsheet from your database that contains the information).

Year	Total # reported/ identified	Total # investigated	# that conveyed exempt discharges or NPDES permitted	# that conveyed illicit discharges that were terminated	# that were removed	# that resulted in enforcement action	# that resulted in <i>other</i> actions
01/02	0	0	0	0	0	0	0
02/03	0	0	0	0	0	0	0

10/11	0	0	0	0	0	0	0
11/12	0	0	0	0	0	0	0

11. Explain any *other* actions that occurred in the last year.

N/A

12. What is the average time it takes your agency to initiate an illicit connection investigation after it is reported?

Less than 24 hours

a) Were all identified connections terminated within 180 days? N/A

Yes No

b) If not, explain why.

None found this reporting cycle.

13. Provide the reporting data for illicit discharges as suggested in the following table (you may submit a spreadsheet from you database that contains this information).

Year	Total # reported	Total # that were discontinued/ cleaned up voluntarily through enforcement and the source was identified	# that were cleaned up but the source could not be identified	# that resulted in no evidence of discharge	# that were determined to be conditionally exempt	# that were exempt or in compliance and the source identified	# that resulted in enforcement action

11/12	19	19	0	0	0	0	0

14. What is the average response time after an illicit discharge is reported? Less than 24 hours

a) Did any response times exceed 72 hours? Yes No

b) If yes, explain why.

N/A

15. Describe your agency's spill response procedures.

If it is a suspected hazardous material, the fire Department is called out. If not, the Public Services Dept takes the lead. The spill is contained and prevented from entering the storm drain system to the extent possible (sand bags, etc.). Spilled materials are collected using appropriate equipment and properly disposed of in accordance with applicable regulations.

16. What would you do differently to improve your agency's IC/ID Elimination Program?

No suggestions at this time.

17. Attach a list of all permitted connections to your storm sewer system.

The City does not permit connections to the storm drain system.

Los Angeles County Municipal Storm Water Permit (Order 01-182)**Individual Annual Report Form****Attachment U-4****V. Monitoring**

Briefly describe any storm water monitoring activities that are not required by Order No. 01-182 that your municipality conducted, participated in, or received funding to conduct in the past fiscal year. These activities should correspond with the dollar amount you listed in Table 2.

LA County is currently responsible for monitoring activities

VI. Assessment of Program Effectiveness

A. Attach a summary of the effectiveness of your storm water management program. This summary should include, at a minimum, the following:

1. An assessment of your agency's compliance with permit requirements, based on your responses to the questions in this form;

The City of Norwalk is in full compliance with applicable requirements of the MS4 permit.

2. Descriptions of any evaluation methods that your agency uses to determine the effectiveness of your storm water management program;

The City used: the completion and evaluation of this annual report, assessment of trash and debris amounts collected from city streets and catch basins, informal information from citizens, studies by scientific groups as they come to the attention of the city, and participation in watershed events.

3. A summary of the strengths and weaknesses of your agency's storm water management program;

Strengths include: Active participant in watershed meetings and Executive Advisory committees, aggressive street sweeping, annual education and training, and public outreach.

4. A list of specific program highlights and accomplishments;

See the San Gabriel River Watershed Area Management Committee's annual assessment

Los Angeles County Municipal Storm Water Permit (Order 01-182)**Individual Annual Report Form****Attachment U-4**

5. A description of water quality improvements or degradation in your watershed over the past fiscal year;
The City is unaware of any water quality improvements or degradation in this reporting period.
6. Interagency coordination between cities to improve the storm water management program;
Coordination between cities to improve the storm water management program is made through actively participating in the San Gabriel River Watershed Management Committee.
7. Future plans to improve your agency's storm water management program; and
The City intends to continue improving its stormwater program where possible.
8. Suggestions to improve the effectiveness of your program or the County model programs.
None at this time

- B. On a scale of 1 to 10 (10 being full implementation of requirements by their deadlines), rate your municipality's level of compliance with Order No. 01-182.

10

- C. List any suggestions your agency has for improving program reporting and assessment.

None at this time

ATTACHMENT H-7

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

This form summarizes the requirements in Order No. 01-182. Each Permittee must complete this form in its entirety, except for those requirements applicable only to the Principal Permittee. Only report activities that were performed during the previous fiscal year. Upon completion, this form shall be submitted to the Principal Permittee, by the date specified by the Principal Permittee, for inclusion in the unified Annual Storm Water Program Report. Attachments should be included where necessary to provide sufficient information on program implementation.

The goals of this Report are to: 1) concisely document implementation of the Storm Water Quality Management Program (SQMP) during the past fiscal year; 2) evaluate program results for continuous improvement; 3) to determine compliance with Order 01-182; and 4) to share this information with other Permittees, municipal decision makers, and the public.

!	YOU MUST FILL OUT ALL THE INFORMATION REQUESTED <i>Do not leave any of the sections blank.</i>
N/A	If the question does not apply to your municipality, please indicate N/A in the space provided and provide a brief explanation
U	If the information requested is currently unavailable, please indicate U in the space provided and give a brief explanation.

This Report Form consists of the following sections:

SECTION	PAGE
I. Program Management	2-4
II. Receiving Water Limitations	5
III. SQMP Implementation	5-7
IV. Special Provisions	8
IV.A. Public Information and Participation Program	8-14
IV.B. Industrial/Commercial Facilities Program	15-17
IV.C. Development Planning Program	18-21
IV.D. Development Construction Program	22-23
IV.E. Public Agency Activities Program	24-33
IV.F. IC/ID Elimination Program	34-37
V. Monitoring	38
VI. Assessment of Program Effectiveness	38
VII. Certification	39

Reporting Year 2011- 2012

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

I. Program Management

- A. Permittee Name: City of Westlake Village
- B. Permittee Program Supervisor: John F. Knipe
 Title: City Engineer
 Address: 31200 Oak Crest Drive
 City: Westlake Village Zip Code: 91361
 Phone: (800) 706-1613 Fax: (805) 643-0791
- C. In the space below, briefly describe how the storm water program is coordinated within your agency's departments and divisions. Include a description of any problems with coordination between departments. To facilitate this, complete the Table 1.

The City Engineer provides supervision and oversight of the Stormwater Program Manager in the Engineering Department. The Stormwater Program Manger is responsible for implementation of all aspects of the NPDES Permit and coordinates activities with the other City departments and LA County Departments from which we contract services.

For Development Planning and Construction, the City contracts plan review and approval as well as construction inspection services with LA County Building and Safety. The City does review development applications and applies conditions of approval, with the NPDES compliance conditions being contributed by the Engineering Department. Then the applicant proceeds through the permitting process with LA County, including submitting SUSMP and SWPPP documents for review and approval prior to issuance of local permits. The City's Stormwater Program Manager and the County Building and Safety Division review the SUSMP and SWPPP documents simultaneously, with the developer being required to obtain approvals from both agencies prior to issuance of grading or building permits. Once permits are issued, the County inspectors oversee development construction activities, enforcing compliance with the approved SUSMP, SWPPP and WVECP's. LA County Building and Safety then reports the necessary record keeping information back to City staff.

TABLE 1 - Program Management

Storm Water Management Activity	Division/Department	# of Individuals Responsible for Implementing
1. Outreach & Education	Engineering	1
2. Industrial/Commercial Inspections	Engineering	1
3. Construction Permits/Inspections	Engineering (Contract to LAC Building & Safety)	1
4. IC/ID Inspections	Engineering & Public Works	2
5. Street sweeping	Engineering	1
6. Catch Basin Cleaning	Engineering (Contract to LACFCD)	1
7. Spill Response	Engineering & Public Works	3
8. Development Planning (project/SUSMP review and approval)	Engineering (Contract to LAC Building and Safety)	2
9. Trash Collection	Planning (Contract to Polis Associates)	2

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

D. Staff and Training

Attach a summary of staff training over the last fiscal year. This shall include the staff name, department, type of training, and date of training.

E. Budget Summary

1. Does your municipality have a storm water utility? Yes No
If no, describe the funding source(s) used to implement the requirements of Order No. 01-182.

General Fund.

2. Are the existing financial resources sufficient to accomplish all required activities? Yes No

3. Complete Table 2 to the extent that accurate information is available (indicate U in the spaces where the information is unavailable), and report any supplemental dedicated budgets for the same categories on the lines below the table.

4. List any additional state/federally funded projects related to storm water.

Three Springs Storm Water Quality Improvement, Prop 13 Phase II Project
Malibu Creek Watershed –Wide Monitoring Program, Prop 13 Phase II Project
Proposition 50 – Citywide Landscape and Irrigation Retrofit Program

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

TABLE 2

Program Element	Expenditures in Previous Fiscal Year	Estimated Amount Needed to implement Order 01-182
1. Program management a. Administrative costs b. Capital costs	\$184,825 \$3,120	U
2. Public Information and Participation a. Public Outreach/Education b. Employee Training c. Corporate Outreach d. Business Assistance	\$1,699 \$744 \$0 \$0	U
3. Industrial/Commercial inspection/ site visit activities	\$0	U
4. Development Planning	\$2,914	U
5. Development Construction a. Construction inspections	\$601	U
6. Public Agency Activities a. Maintenance of structural and treatment control BMPs b. Municipal street sweeping c. Catch basin cleaning d. Trash collection/recycling e. Capital costs f. Other	\$1007 \$21,828 \$1,370 \$2,960 \$0 \$0	U
7. IC/ID Program a. Operations and Maintenance b. Capitol Costs	\$686 \$0	U
8. Monitoring	\$13,356	U
9. Other	\$14,285	U
10. TOTAL	\$249,393	U

List any supplemental dedicated budgets for the above categories:

- * Proposition 50, Chapter 8 provided \$103,871.43 for the \$446,564 Citywide Landscape and Irrigation Retrofit Project (Prior year)
- * Total Street Sweeping Budget = \$115,581 (estimated 19.2% increase for NPDES BMP's implemented in 1996, therefore \$22,200 annual implementation cost)
- * Recycling Services is approximately \$105,000

List any activities that have been contracted out to consultants/other agencies:

Portions of the Development Planning/Development Construction is contracted to LA County Building & Safety. Stormwater Program Management is handled through the City Engineering services contract with Willdan (contract City staff). Catch basin cleaning is contracted to LA County Flood Control District. Sanitary Sewer maintenance is contracted to the consolidated sewer maintenance district.

Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4

II. Receiving Water Limitations (Part 2)

- A. Are you aware, or have you been notified, of any discharges from your MS4 that cause or contribute to a condition of nuisance or to the violation of any applicable water quality standards? Yes No
- B. Has the Regional Board notified you that discharges from your MS4 are causing or contributing to an exceedance of water quality standards? Yes No
- C. If you answered Yes to either of the above questions, you must attach a Receiving Water Limitations (RWL) Compliance Report. The Report must include the following:
1. A description of the pollutants that are in exceedance and an analysis of possible sources;
 2. A plan to comply with the RWL (Permit, Part 2);
 3. Changes to the SQMP to eliminate water quality exceedances;
 4. Enhanced monitoring to demonstrate compliance; and
 5. Results of implementation.

III. SQMP Implementation (Part 3)

- A. Has your agency implemented the SQMP and any additional controls necessary to reduce the discharges of pollutants in storm water to the maximum extent practicable? Yes No
- B. If your agency has implemented additional or different controls than described in the countywide SQMP, has your agency developed a local SQMP that reflects the conditions in its jurisdiction and specifies activities being implemented under the appropriate elements described in the countywide SQMP? Yes No
- C. Describe the status of developing a local SQMP in the box below.

The City is currently working with other Malibu Creek and Lagoon Bacteria TMDL responsible agencies to implement measures developed in the Integrated Total Maximum Daily Load Implementation Plan for the Malibu Creek Watershed. The plan is aimed toward implementation of the SQMP and any additional programs suitable to the Malibu Creek Watershed through a regionally consistent, economically efficient approach.

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

- D. If applicable, describe an additional BMP, in addition to those in the countywide SQMP, that your city has implemented to reduce pollutants in storm water to the maximum extent practicable.

Weekly street sweeping citywide, measures identified in the above mentioned Implementation Plan.

E. Watershed Management Committees (WMCs)

1. Which WMC are you in? Malibu Creek and Rural SMB Watersheds
2. Who is your designated representative to the WMC? Joe Bellomo
3. How many WMC meetings did you participate in last year? 11
4. Describe specific improvements to your storm water management program as a result of WMC meetings.

The WMC meetings enable the watershed Cities to share information, success on pilot programs, and combine resources to be more effective at implementing programs that apply regionally. The Cities continue to use the WMC to combine resources for local public education and outreach activities. The Cities also use the WMC to move forward supplemental plans to achieve water quality improvements such as grants and TMDL programs such as the Total Integrated TMDL Implementation Plan for the Malibu Creek Watershed, and Trash Monitoring and Reporting Plan.

5. Attach any comments or suggestions regarding your WMC.

F. Storm Water Ordinance

1. Have you adopted a storm water and urban runoff ordinance to enforce all requirements of Order 01-182? Yes No
If not, describe the status of adopting such an ordinance.

N/A

2. If yes, have you already submitted a copy of the ordinance to the Regional Board? Yes No
If not, please attach a copy to this Report.
3. Were any amendments made to your storm water ordinance during the last fiscal year? Yes No
If yes, attach a copy of amendments to this Report.

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

G. Discharge Prohibitions

- 1. List any non-storm water discharges you feel should be further regulated:

None

- 2. List any non-storm water discharges you feel should be exempt, and provide an explanation for each:

None

IV. Special Provisions (Part 4)

A. Public Information and Participation (Part 4.B)

In addition to answering the following questions, attach a summary of all storm water education activities that your agency conducted or participated in last year.

1. No Dumping Message

a) How many storm drain inlets does your agency own? 42

b) How many storm drain inlets were marked with a no dumping message in the last fiscal year? U

c) What is the total number of storm drain inlets that are legibly marked with a no dumping message? 409 (42 city, 367 county)
If this number is less than the number in question 1.b, describe why all inlets have not been marked, the process used to implement this requirement, and the expected completion date.

N/A

d) How many public access points to creeks, channels, and other water bodies within your jurisdiction have been posted with no dumping signage in the past year? 0
Describe your agency's status of implementing this requirement by the date required in Order No. 01-182.

There are no public access points requiring signage in the City.

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

2. Reporting Hotline

- a) Has your agency established its own hotline for reporting and for general storm water management information? Yes No
- b) If so, what is the number? N/A
- c) Is this information listed in the government pages of the telephone book? Yes No
- d) If no, is your agency coordinated with the countywide hotline? Yes No
- e) Do you keep record of the number of calls received and how they were responded to? Yes No
- f) How many calls were received in the last fiscal year? N/A
(County of Los Angeles does not have city specific totals available.)
- g) Describe the process used to respond to hotline calls.

When a hotline call is received by 888cleanla, they either respond directly or refer the call to our Stormwater Program Manger who investigates the report upon receipt of notification (next business day). If clean-up is needed, a service request is issued to LA County Flood control for response.
- h) Have you provided the Principal Permittee with your current reporting contact information? Yes No
- i) Have you compiled a list of the general public reporting contacts for all Permittees and posted it on the www.888CleanLA.com web site (Principal Permittee only)? N/A Yes No
If not, when is this scheduled to occur? N/A

3. Outreach and Education

- a) Describe the strategy developed to provide outreach and bilingual materials to target ethnic communities. Include an explanation of why each community was chosen as a target, how program effectiveness will be determined, and status of implementation. (Principal Permittee only)

N/A

Los Angeles County Municipal Storm Water Permit (Order 01-182)

Individual Annual Report Form

Attachment U-4

- b) Did the Principal Permittee organize quarterly Public Outreach Strategy meetings that you were aware of? Yes No

How many Public Outreach Strategy meetings did your agency participate in last year? All

Explain why your agency did not attend any or all of the organized meetings.

We coordinate representation at the Public Outreach Strategy meetings through our Watershed Management Committee. One representative from the WMC attends the meetings, taking ideas/suggestions from the WMC forum and then reported back to the WMC on what happened at the meeting.

Identify specific improvements to your storm water education program as a result of these meetings:

The Public Outreach Strategy meetings provide a forum for the County to share their outreach activities, and make their already developed advertising materials available to the Cities for use in their specific programs. This allows the sharing of resources that otherwise would not be available to individual city programs because of costs.

List suggestions to increase the usefulness of quarterly meetings:

For more cities to share their experiences and ideas for outreach in their communities.

If quarterly Public Outreach Strategy meetings were not organized, explain why not and when this requirement will be implemented (*Principal Permittee only*).

N/A

- c) Approximately how many impressions were made last year on the general public about storm water quality via print, local TV, local radio, or other media? Greater than 100,000

- d) Describe efforts your agency made to educate local schools on storm water pollution.

In collaboration with Los Angeles County's school outreach program, we ensure local schools are exposed to watershed education material. In addition, the City's Schools program included water quality elements to White Oak Elementary 4th graders in their annual outreach.

Los Angeles County Municipal Storm Water Permit (Order 01-182)

Individual Annual Report Form

Attachment U-4

- e) Did you provide all schools within each school district in Los Angeles County with materials necessary to educate a minimum of 50 percent of all school children (K-12) every 2 years on storm water pollution (*Principal Permittee only*)? N/A Yes No
If not, explain why.

N/A

- f) Describe the strategy developed to measure the effectiveness of in-school educational programs, including assessing students' knowledge of storm water pollution problems and solutions before and after educational efforts (*Principal Permittee only*).

N/A

For Permit Years 2-5, attach an assessment of the effectiveness of in-school storm water education programs.

- g) What is the behavioral change target that was developed based on sociological data and other studies (*Principal Permittee only*)?

N/A

If no target has been developed, explain why and describe the status of developing a target.

N/A

What is the status of meeting the target by the end of Year 5?

N/A

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

4. Pollutant-Specific Outreach

- a) Attach a description of each watershed-specific outreach program that your agency developed (*Principal Permittee only*). All pollutants listed in Table 1 (Section B.1.d.) must be included.
- b) Did your agency cooperate with the Principal Permittee to develop specific outreach programs to target pollutants in your area? Yes No
- c) Did your agency help distribute pollutant-specific materials in your city? Yes No
- d) Describe how your agency has made outreach material available to the general public, schools, community groups, contractors and developers, etc...

There are handouts always available at our public counter at the City Hall and the Westlake lake management office. We periodically place info on BMPs in the Westlake Village "City News," and have included pollutant specific articles. The "City News" is a full color, two-sided newsletter that goes to every City resident monthly. We are able to provide guidance on BMPs and alternate ways to conduct these activities in a Lake-friendly manner. We distribute the Living Lightly in Our Watershed Guide and other like materials to the community.

5. Businesses Program

- a) Briefly describe the Corporate Outreach Program that has been developed to target gas stations and restaurant chains (*Principal Permittee only*).

N/A

- b) How many corporate managers did your agency (*Principal Permittee only*) reach last year? N/A
- c) What is the total number of corporations to be reached through this program (*Principal Permittee only*)? N/A
- d) Is your agency meeting the requirement of reaching all gas station and restaurant corporations once every two years (*Principal Permittee only*)? N/A Yes No
If not, describe measures that will be taken to fully implement this requirement.

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

N/A

- e) Has your agency developed and/or implemented a Business Assistance Program? Yes No
If so, briefly describe your agency's program, including the number of businesses assisted, the type of assistance, and an assessment of the program's effectiveness.

Through site visits and inspections City staff has educated the business community about Stormwater regulations, and followed up through check up visits to ensure all environmental laws are being followed.

6. Did you encourage local radio stations and newspapers to use public service announcements? Yes No
How many media outlets were contacted? 2
Which newspapers or radio stations ran them?

Westlake Village "City News", and Westlake Village close circuit TV.

Who was the audience?

Westlake Village residents and businesses.

7. Did you supplement the County's media purchase by funding additional media buys? Yes No
Estimated dollar value/in-kind contribution: \$2,500
Type of media purchased: Promotional
Frequency of the buys: annually
Did another agency help with the purchase? Yes No

8. Did you work with local business, the County, or other Permittees to place non-traditional advertising? Yes No
If so, describe the type of advertising.

The Malibu Creek Watershed revised and reprinted the Living Lightly in Our Watershed Guide and continually distributes the guide. Through the Watershed Coordinator the City participates in many other outreach programs and advertising programs. The City partnered with Agoura Hills, Calabasas, and LVMWD in the Watershed Stewardship Project video.

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

9. Did you establish local community partnerships to distribute educational storm water pollution prevention material? Yes No

Describe the materials that were distributed:

During this permit cycle, the City distributed a drainage map that the students can trace from their home to the discharge point at a major waterbody. Seeds, organic pot, and potting soil were distributed to each student to grow at home. A number of other informational handouts are distributed during City events.

Who were the key partners? None

Who was the audience (businesses, schools, etc.)?

4th Graders and parents.

10. Did you participate in or publicize workshops or community events to discuss storm water pollution? Yes No

How many events did you attend? At least 4

11. Does your agency have a website that provides storm water pollution prevention information? Yes No

If so, what is the address? <http://www.wlv.org/directoryofcityservices/engineeringandpublicworks/docStormWater.aspx>

12. Has awareness increased in your community regarding storm water pollution? Yes No

Do you feel that behaviors have changed? Yes No

Explain the basis for your answers. Include a description of any evaluation methods that are used to determine the effectiveness of your agency's outreach.

The educational site visits have increased the awareness at commercial facilities. Site inspections of commercial businesses for the past five years have resulted in fewer violations with each subsequent series of inspections. As in years past, this reported fiscal year made use of the City's public access channel to air stormwater type PSAs and announcements. Residential awareness primarily benefited from this practice as well as from Lightly Guides. Awareness is evident through public reports of illicit discharges such as mobile carwashes to the City for follow-up.

13. How would you modify the storm water public education program to improve it on the City or County level?

Increase the frequency of PSAs and distribution of stormwater quality material to commercial and residential. These will be implemented throughout the watershed as we intended through the Integrated TMDL Implementation Plan for the Malibu Creek Watershed and Integrated Regional Water Management Programs at the Leadership and Subregional level.

NPDES No. CAS 004001

Order No. 01-182

Los Angeles County Municipal Storm Water Permit (Order 01-182)

Individual Annual Report Form**

Attachment U-4

B. Industrial/Commercial Facilities Program

1. Critical Source Inventory Database

Did you (individually or jointly) update the Database for Critical Sources Inventory? Yes No

Comments/Explanation/Conclusion:

The database has been updated and to include a breakdown of all industrial/commercial businesses that are identified under the countywide NPDES stormwater permit for participation in the Industrial/Commercial Facilities Control Program. The vast majority of these businesses consist of retail gasoline outlets, restaurants, and automotive service facilities. This database is utilized in the coordination of the inspections of these facilities for implementation of the appropriate BMPs as required under the countywide NPDES permit.

2. Inspection Program

Provide the reporting data as suggested in the following tables.

Category	Initial Number of Facilities at the start of cycle proposed for inspection by categories (after the initial year, the updated number based on the new data)	Number of facilities inspected in the current reporting year	% Completed at the time of this report for present cycle (from the initial value, and from the updated value after first cycle)	Total number since permit adoption
Landfills	0	0	N/A	0
TSDf	0	0	N/A	0
Retail Gasoline Outlets	3	0	100%	7
Restaurants	32	0	100%	71
Automotive Services	10	0	100%	21
Phase 1 Facilities	1	0	100%	1
Comments/Explanation/Conclusion:			None	

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form**

Attachment U-4

3. BMPs Implementation

Provide the reporting data as suggested in the following table.

Category	Number of facilities inspected by category in this reporting year	Number of facilities identified as adequately implementing BMPs as specified in this reporting year	% adequately implementing out of total in this reporting year	Number of facilities required to implement or upgrade in this reporting year	Number of facilities inspected by category in this reporting cycle	Number of facilities identified as adequately implementing BMPs as specified in this reporting cycle	% adequately implementing out of total in this reporting cycle	Number of facilities required to implement or upgrade in this reporting cycle	Total Number during this permit adequately implementing	Total Number during this permit required to implement or upgrade
Landfills	0	N/A	N/A	N/A	0	0	0	0	0	0
TSDf	0	N/A	N/A	N/A	0	0	0	0	0	0
Retail Gasoline Outlets	0	N/A	N/A	N/A	3	3	100	1	3	1
Restaurants	0	N/A	N/A	N/A	32	31	97	7	32	7
Automotive Services	0	N/A	N/A	N/A	10	10	100	1	10	1

Comments/Explanation/Conclusion: Most recent inspections did not identify any major stormwater violations.

4. Enforcement Activities

Provide the reporting data as suggested in the following tables.

Enforcement Actions by categories (e.g. Warning letter, NOV, referral to D.A., etc.)	Number of facilities issued enforcement actions in the current reporting year	Number of facilities issued enforcement actions in the current reporting cycle	Number of facilities (re)inspected due to enforcement actions in current reporting year	Number of facilities (re)inspected due to enforcement actions in current reporting cycle	Number of facilities brought into compliance in the current reporting year	Number of facilities brought into compliance in current reporting cycle	Total number of enforcement actions since permit adoption (by category)
Warning Letter	0	10	0	10	0	10	10
NOV	0	0	0	0	0	0	0
Referral to DA	0	0	0	0	0	0	0

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form**

Attachment U-4

Facilities by category	Number of Warning letters	Number of NOVs	Number of Referral	Number of Other
Retail Gasoline Outlets	0	0	0	N/A
Restaurants	0	0	0	N/A
Automotive Servies	0	0	0	N/A
Comments/Explanation/Conclusion:		None		

5. Program Implementation Effectiveness Assessment

Please give a brief assessment of the implementation of the program in removing pollutants from the storm water discharges. Please provide an explanation. Suggested improvements or adjustments based on the knowledge gained through this reporting period activities must be reflected in a change in the SQMP, if warranted.

Highly Effective

Somewhat Effective

Non-effective

Comments/Explanation/Conclusion:

Inspection Program found most facilities to be in compliance with stormwater quality regulations and implementing BMPs adequately. A violation noted in a prior reporting year at a majority of the facilities was open trash bin lids. Upon further investigation, this common problem was due to the trash collectors pinning the trash bin lids behind the bin after collection. A letter was sent to the two companies that provide service to the City and copy sent to all inspected facilities requesting the collectors to ensure that lids are closed after collection to help the facilities maintain a closed trash bin lid. Since the letter was sent out, no complaints have been filed in regards to this issue and no open trash bin lids have been observed. The one facility with violations that required a follow-up visit met compliance during second visit and the general feeling from all facilities in Westlake Village was interest in preventing stormwater violations and responsiveness to the programs objectives.

6. You must also submit a quarterly electronic submittal of your Industrial/Commercial Facilities Program activities.

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

C. Development Planning Program (Part 4.D)

1. Does your agency have a process to minimize impacts from storm water and urban runoff on the biological integrity of natural drainage systems and water bodies in accordance with requirements under CEQA, Section 404 of the CWA, local ordinances, and other legal authorities? Yes No
 Attach examples showing how storm water quality impacts were addressed in environmental documents for projects over the past year.

2. Does your agency have procedures to include the following requirements in all priority development and redevelopment projects:
 - a) Maximize the percentage of permeable surfaces to allow more percolation of storm water into the ground? Yes No
 - b) Minimize the quantity of storm water directed to impermeable surfaces and the MS4? Yes No
 - c) Minimize pollution emanating from parking lots through the use of appropriate treatment control BMPs and good housekeeping practices? Yes No
 - d) Provide for appropriate permanent measures to reduce storm water pollutant loads from the development site? Yes No

3. List the types and numbers of BMPs that your agency required for priority projects to meet the requirements described above.

There are a number of planning priority projects, which have been conditioned to provide stormwater management and mitigation measures through the provisions of the SUSMP. An example, a commercial development met the stormwater management conditions of approval by the installation of in-line treatment devices (CDS units), catch basin filter inserts, or a combination thereof, prior to discharge of stormwater flows from the site. These sites do not have any significant slopes that would require stabilization measures.

4. Describe the status of the development or implementation of peak flow controls in Natural Drainage Systems.

The SUSMP requirement for developers to demonstrate no increase in peak flows where there is potential for downstream erosion has been implemented. Increase to peak flows due to development were mitigated by requiring on-site detention facilities whose design requirements included volumes generated by inflow-outflow hydrographs. In addition, the required Peak Flow Control Feasibility Study is being coordinated via LA County (Principal Permittee).

Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4

5. Has your agency amended codes and/or ordinances to give legal effect to the SUSMP changes required in the Permit? Yes No
6. Describe the process your agency uses to include SUSMP design standards in new development and redevelopment project approvals.

The City contracts all Building and Safety services through LA County. Each new development application is reviewed by all City Departments and conditions of approval are imposed. The Engineering Department conditions projects to meet all requirements per the NPDES Permit and SUSMP. LA County Building and Safety conducts development plan review and approvals, issues grading/building permits and oversees development construction. When a development project is submitted to County and it includes any grading or new construction, it is referred to the drainage and grading plan check engineer. In Addition to basic drainage and grading review, the plan check engineer enforces SUSMP and SWPPP/WWECP requirements. The plan check engineer obtains, reviews and approves the SUSMP mitigated flow rate calculations (Qpm/Vpm) from the developer and then refers the developer to the County Environmental Programs Division (EPD) for review and approval of their proposed SUSMP devices. The EPD checks the submitted SUSMP devices against the approved Qpm/Vpm calculation and confirms that the proposed devices provide sufficient filtration capacity and appropriate pollutant removal qualities for the associated land use. EPD also requires developers to obtain Industrial Waste Permits for annual inspection of any proposed structural BMP devices. The developer returns the EPD-approved SUSMP to the Buildings and Safety Department for final approval and permit issuance, including confirmation that the proposed SUSMP devices are included in the construction drawings. Prior to final approvals, the County contacts WLVP and requests confirmation that the City departments have established compliance with all conditions of approval. Once all SUSMP, SWPPP and WWECP requirements are met, a building or grading permit can be issued.

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

7. How many of each of the following projects did your agency review and condition to meet SUSMP requirements last year?
- | | |
|---|---|
| a) Residential | 0 |
| b) Commercial | 0 |
| c) Industrial | 0 |
| d) Automotive Service Facilities | 0 |
| e) Retail Gasoline Outlets | 0 |
| f) Restaurants | 1 |
| g) Parking Lots | 0 |
| h) Projects located in or directly adjacent to or discharging directly to an environmentally sensitive area | 0 |
| i) Total number of permits issued to priority projects | 0 |
8. What is the percentage of total development projects that were conditioned to meet SUSMP requirements? 0.8%
9. How has your agency prepared to reduce the SUSMP threshold for industrial/commercial facilities to 1 acre from 100,000 square feet in 2003?

All of our review sheets indicate the reduced threshold. Every permittee that applies for a building permit is subject to the reduced threshold of 1 acre.

10. After 2003, how many additional projects per year will require/did require implementation of SUSMP requirements as a result of the lower threshold? U
11. Does your agency participate in an approved regional or sub-regional storm water mitigation program to substitute in part or wholly SUSMP requirements for new development? Yes No
12. Has your agency modified its planning procedures for preparing and reviewing CEQA documents to consider potential storm water quality impacts and provide for appropriate mitigation? Yes No

If no, provide an explanation and an expected date of completion.

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

N/A

13. Did your agency update any of the following General Plan elements in the past year?

- a) Land Use Yes No
- b) Housing Yes No
- c) Conservation Yes No
- d) Open Space Yes No

If yes, please describe how watershed and storm water quality and quantity management considerations were included.

N/A

- 14. How many targeted staff were trained last year? 5
- 15. How many targeted staff are trained annually? 5
- 16. What percentage of total staff are trained annually? 100%
- 17. Has your agency developed and made available development planning guidelines? Yes No
- 18. If no, what is the expected date that guidelines will be developed and available to developers? N/A
- 19. What is the status of completion of the technical manual for siting and design of BMPs for the development community?

This has been completed by Los Angeles County and is posted on their website (http://ladpw.org/wmd/NPDES/Dev_Construction). We contract all Building and Safety Services with LA County, and as such we adopted the technical manual provided by the County.

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

D. Development Construction Program

1. Describe your agency's program to control runoff from construction activity at all construction sites within its jurisdiction.

All applicants are required to prepare a Wet Weather Erosion Control Plan and/or Local Storm Water Pollution Prevention Plan (LSWPPP) based on the guidelines described in the BMP Construction Handbook. Based on the approved plans, the inspector ensures that the contractor has installed all necessary BMPs and that the site and adjacent properties are protected from runoff.

2. Does your agency require the preparation, submittal, and implementation of a Local Storm Water Pollution Prevention Plan (Local SWPPP) prior to the issuance of a grading permit for all sites that meet one or all of the following criteria?

- a) Will result in soil disturbance of one acre or greater Yes No
- b) Is within, directly adjacent to, or is discharging directly to an environmentally sensitive area Yes No
- c) Is located in a hillside area Yes No

3. Attach one example of a local SWPPP

4. Describe the process your agency uses to require proof of filing a Notice of Intent for coverage under the State General Construction Activity Storm Water permit and a certification that a SWPPP has been prepared prior to issuing a grading permit?

We require the following information prior to all grading plan approvals:

1. A copy of the filed NOI
2. The issued WDID number
3. The Local SWPPP

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

- 5. How many building/grading permits were issued to sites requiring Local SWPPPs last year? 0
- 6. How many building/grading permits were issued to sites requiring coverage under the General Construction Activities Storm Water Permit last year? 0
- 7. How many building/grading permits were issued to construction site less than one acre in size last year? 126
- 8. How many construction sites were inspected during the last wet season?
(Verify with inspector for information.) U
- 9. Complete the table below.

Type of Violation	# of Violations	% of Total Inspections	# of Follow-up Inspections	# of Enforcement Actions
Off-site discharge of sediment	0	0	0	0
Off-site discharge of other pollutants	0	0	0	0
No or inadequate SWPPP	0	0	0	0
Inadequate BMP/SWPPP implementation	0	0	0	0

- 10. Describe the process for taking enforcement actions against construction site violations, including the types of actions that are taken.

We contract all Building and Safety Services with LA County. The County inspectors require SWPPP implementation on areas to be disturbed prior to beginning of construction. Once construction is underway, the inspector visits the site a minimum of once per week and confirms complete and appropriate SWPPP implementation. If any off-site discharge or inadequate SWPPP implementation is observed, the inspector will write up a notice of correction. The notice of correction specifies what needs correction and indicates that if the corrections are not made within 24 hours, a stop work will be issued until the site is brought into full SWPPP compliance. A follow-up inspection is conducted in 24 hours and if the site is still not in compliance a stop work is enforced until the requested corrections are made. If the correction is a minor thing (ie: moving sand bags, etc), the inspector has it done immediately while they are on site. There were no violations this year that were not immediately corrected in the field at the time of the visit/inspection.

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

11. Describe the system that your agency uses to track the issuance of grading permits.

We contract all Building and Safety Services with LA County. LA County uses a computerized database (DAPTS) to track all grading and building permits issued.

E. Public Agency Activities (Part 4.F)

1. Sewage System Maintenance, Overflow, and Spill Prevention (only applicable to agencies that own and/or operate a sanitary sewer system)

- a) Has your agency developed and implemented a response plan for sanitary sewer overflows that includes the requirements in Order 01-182? Yes No
- b) How many sanitary sewer overflows occurred within your jurisdiction? 1
- c) How many did your agency respond to? 1
- d) Did your agency investigate all complaints received? Yes No
- e) How many complaints were received? 1
- f) Upon notification, did your agency immediately respond to overflows by containment? Yes No
- g) Did your agency notify appropriate sewer and public health agencies when a sewer overflowed to the MS4? Yes No
- h) Did your agency implement a program to prevent sewage spills or leaks from sewage facilities from entering the MS4? Yes No

If so, describe the program:

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

The Consolidated Sewer Maintenance District (CSMD) is responsible for sewer maintenance services of City owned collectors CSMD has a formalized CMOM program and does routine maintenance inspections of sewer manholes to prevent unexpected blockages and resulting overflows. When an overflow does occur, the County is notified immediately and responds with containment.

- i) Did your agency implement a program to identify, repair, and remediate sanitary sewer blockages, exfiltration, overflow, and wet weather overflows from sanitary sewers to the MS4? Yes No

If so, describe the program:

The Consolidated Sewer maintenance District (CSMD) is responsible for sewer maintenance services of City owned collectors. CSMD has a formalized CMOM program and does routine maintenance inspections of sewer manholes to prevent unexpected blockages and resulting overflows. When an overflow does occur, the County is notified immediately and responds with containment.

2. Public Construction Activities Management

- a) What percentage of public construction sites 5 acres or greater in size did your agency obtain coverage under the State of California General Construction Activities Storm Water Discharge Permit ? 100 %
- b) Give an explanation for any sites greater than 5 acres that were not covered:

All were covered.

- c) What is the total number of active public construction sites? 2
 How many were 5 acres or greater in size? 1

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

- d) (After March, 2003) Did your agency obtain coverage under the State of California General Construction Activities Storm Water Discharge Permit coverage for public construction sites for sites one acre or greater? Yes No

3. Vehicle Maintenance/Material Storage Facilities/Corporation Yards Management

- a) Did your agency implement pollution prevention plans for each public vehicle maintenance facility, material storage facility, and corporation yard? N/A Yes No

We do not have any vehicle maintenance facility, material storage facility, or corporation yard. We contract major services through LA County.

- b) Briefly describe how your agency implements the following, and any additional, BMPs to minimize pollutant discharges in storm water:
 - (1) Good housekeeping practices
 - (2) Material storage control
 - (3) Vehicle leaks and spill control
 - (4) Illicit discharge control

We do not have any vehicle maintenance facility, material storage facility, or corporation yard. We contract major services through LA County.

- c) Are all Permittee owned and/or operated vehicle/equipment wash areas self-contained, covered, equipped with a clarifier, and properly connected to the sanitary sewer? N/A Yes No
If not, what is the status of implementing this requirement?

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

We do not own or operate any vehicle / equipment wash areas.

- d) How many Permittee owned and/or operated vehicle/equipment wash areas are scheduled to be redeveloped to include the BMPs listed above? N/A

4. Landscape and Recreational Facilities Management

- a) Has your agency developed a standardized protocol for the routine and non-routine application of pesticides, herbicides (including pre-emergents), and fertilizers? Yes No

Briefly describe this protocol:

We contract landscape activities to a professional contractor. Our work agreement includes requirements for compliance with the NPDES permit and copies of the Permit requirements are provided to the landscape contractor. The City Inspector oversees the landscape maintenance contract, enforcing the implementation of NPDES requirements.

- b) How does your agency ensure that there is no application of pesticides or fertilizers immediately before, during, or immediately after a rain event or when water is flowing off the area to be applied?

The landscaping contractor is required to follow this procedure.

- c) Are any banned pesticides, herbicides, fungicides, or rodenticides stored or applied in your agency's jurisdiction that you know of? Yes No
- If so, list them:

N/A

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

- d) What percentage of your agency's staff that apply pesticides are certified by the California Department of Food and Agriculture, or are under the direct supervision of a certified pesticide applicator? N/A
- e) Describe procedures your agency has implemented to encourage retention and planting of native vegetation and to reduce water, fertilizer, and pesticide needs:

All residential and commercial landscaping plans are required to be reviewed and approved by the City's planning staff prior to issuance of building permits. Through this process, the planning staff encourages the use of native vegetation, with minimal watering and fertilizing need for all new development. The landscape maintenance consultant is also required to manage public landscaping in light of these requirements.

5. Storm Drain Operation and Management

- a) Did your agency designate catch basin inlets within its jurisdiction as Priority A; Priority B; and Priority C? Yes No
- b) How many of each designation exist in your jurisdiction?

Priority A:	0
Priority B:	0
Priority C:	367
	LACFCD
	42 City
- c) Is your city subject to a trash TMDL? Yes No
- d) If yes, describe the activities and/or implementation measures that your agency conducted pursuant to the TMDL and any other trash reduction efforts that occurred.

The Trash Monitoring and Reporting Plan/Minimum Frequency and Collection Program was drafted and submitted to the Regional Board Executive Office for review and approval. In addition to the efforts contained within that plan, the City sweeps streets citywide on a weekly basis, and daily collection of trash within City Rights-of-Way.

Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4

- e) How many times were all Priority A basins cleaned last year? N/A
- f) How many times were all Priority B basins cleaned last year? N/A
- g) How many times were all Priority C basins cleaned last year? 2
- h) How much total waste was collected in tons from catch basin clean-outs last year? 0.54
- i) Attach a record of all catch basins in your jurisdiction. This shall identify each basin as City or County owned, and Priority A, B, or C. For all basins that are owned and operated by your agency, include dates that each was cleaned out over the past year.
- j) Did your agency place and maintain trash receptacles at all transit stops within its jurisdiction. Yes No
- k) How many new trash receptacles were installed last year? 0
- l) Did your agency place special conditions for events that generated substantial quantities of trash and litter including provisions that:
- (1) Provide for the proper management of trash and litter generated from the event? Yes No
- (2) Arrange for temporary screens to be placed on catch basins? Yes No
- (3) Or for catch basins in that area to be cleaned out subsequent to the event and prior to any rain? Yes No
- m) Did your agency inspect the legibility of the catch basin stencil or labels? Yes No
 What percentage of stencils were legible? 100%

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

- n) Were illegible stencils recorded and re-stenciled or re-labeled within 180 days of inspection? Yes No

- o) Did your agency visually monitor Permittee-owned open channel storm drains and other drainage structures for debris at least annually and identify and prioritize problem areas of illicit discharge for regular inspection? Yes No
 County owns most open channels in the City.
 Is the prioritization attached? N/A Yes No

- p) Did your agency review its maintenance activities to assure that appropriate storm water BMPs are being utilized to protect water quality? Yes No
 What changes have been made?

We took over maintenance of the open channel drain at Foxfield Drive from LACFCD and had our landscaping contractor maintain the oil and trash boom. Accumulated debris is removed weekly, and an inspection log was kept on file documenting the amount and type of debris found. In 2009 we turned maintenance back over to the County.

- q) Did your agency remove trash and debris from open channel storm drains a minimum of once per year before the storm season? Yes No

- r) How did your agency minimize the discharge of contaminants during MS4 maintenance and clean outs?

County maintains MS4 system. When the City was responsible for maintenance of the Foxfield Drive open channel, it performed weekly removing algae growth with a net, dried in sunlight and disposed with grass clippings. Trash debris is pulled out weekly (if any) and disposed of in near by trash bin. Sediment is removed by County service twice a year, prior to a rainy season and after the rainy season.

- s) Where is removed material disposed of?

Biomaterial is dried and added to landscapers grass clippings for proper disposal. Infrequent trash material is disposed of in near by trash bin and emptied weekly. Sediment is removed and disposed of by County service.

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

6. Streets and Roads Maintenance

- a) Did your agency designate streets and/or street segments within its jurisdiction as one of the following:
- (1) Priority A – streets and/or street segments that are designated as consistently generating the highest volumes of trash and/or litter? Yes No
All streets are designated "A" since we sweep weekly.
 - (2) Priority B - streets and/or street segments that are designated as consistently generating moderate volumes of trash and/or litter? Yes No
 - (3) Priority C – streets and/or street segments that are designated as generating low volumes of trash and/or litter? Yes No
- b) Did your agency perform all street sweeping in compliance with the permit and according to the following schedule:
- (1) Priority A – These streets and/or street segments shall be swept at least two times per month? Yes No
 - (2) Priority B - Each Permittee shall ensure that each streets and/or street segments is cleaned at least once per month? Yes No
 - (3) Priority C – These streets and/or street segments shall be cleaned as necessary but in no case less than once per year? Yes No

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

- c) Did your agency require that saw cutting wastes be recovered and disposed of properly and that in no case shall waste be left on a roadway or allowed to enter the storm drain? Yes No
- d) Did your agency require that concrete and other street and road maintenance materials and wastes be managed to prevent pollutant discharges? Yes No
- e) Did your agency require that the washout of concrete trucks and chutes only occur in designated areas and never into storm drains, open ditches, streets, or catch basins leading to the storm drain system? Yes No
- f) Did your agency train its employees in targeted positions (whose interactions, jobs, and activities affect storm water quality) regarding the requirements of the storm water management program to:
 - (1) Promote a clear understanding of the potential for maintenance activities to pollute storm water? and Yes No
 - (2) Identify and select appropriate BMPs? Yes No

7. Parking Facilities Management

- a) Did your agency ensure that Permittee-owned parking lots be kept clear of debris and excessive oil buildup and cleaned no less than 2 times per month and/or inspected no less than 2 times per month to determine if cleaning is necessary. Yes No
- b) Were any Permittee-owned parking lots cleaned less than once a month? Yes No
How many? 0

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

8. Public Industrial Activities Management
- a) Did your agency, for all municipal activity considered an industrial activity under USEPA Phase I storm water regulations, obtain separate coverage under the State of California General Industrial Activities Storm Water Discharge Permit no later than December 31, 2001? N/A We do not have any city industrial activity
- b) Does your agency serve a population of less than 100,000 people? Yes No
9. Emergency Procedures
- a) In case of real emergencies, did your agency repair essential public services and infrastructure in a manner to minimize environmental damage? Yes No
- b) Were BMPs implemented to the extent that measures did not compromise public health and safety? N/A No emergency occurred
10. Feasibility Study
- a) Did your agency cooperate with the County Sanitation Districts of Los Angeles County to prepare a study which investigates the possible diversion of dry weather flows or the use of alternative treatment control BMPs? Yes No
- b) Did your agency review its individual prioritized list and create a watershed based priority list of drains for potential diversion and submit a listing of priority diversions to the Regional Board Executive Officer? N/A List prepared by LA County

Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4

F. Illicit Connections and Illicit Discharges (IC/ID) Elimination Program (Part 4.G)

1. Attach a copy of your agency's IC/ID Elimination Implementation Program (Part 4.G.1.a.).
2. Attach a map of your storm drain system showing all permitted connections (if available), and the locations of all illicit connections and discharges that occurred last year (Part 4.G.1.b). If your agency has not completed this requirement, describe the status of the development of a baseline map, including an expected completion date.

Local storm drains are owned and maintained by Los Angeles County Flood Control District.

3. Describe your enforcement procedures for eliminating illicit discharges and terminating illicit connections.

Illicit dischargers are notified to cease this activity in person (if caught in the act) and in writing (all occasions) and given educational material relative to the nature of the discharge. We have not had a single occasion where a discharger repeated the offense upon notification and education. However, should the discharger persist, the process would be to give a second written notice with information regarding legal actions that will be brought if the discharge persists. After second notice, the City Attorney would bring a civil or criminal action to abate, enjoin or otherwise compel the cessation of the illicit discharge.

Illicit connections are handled similarly.

4. Describe your record keeping system to document all illicit connections and discharges.

Illicit dischargers and connection incidents are put into the City's Service Request Database. Investigations and follow-up are documented through the database of the service request. For service requests involving discharges or connections, a record is also placed in our excel spreadsheet of ICIDs for annual update on our GIS map and then a hard copy placed on file in the NPDES ICID Program File.

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

- 5. What is the total length of open channel that your agency owns and operates? 0
- 6. What length was screened last year for illicit connections? 0
- 7. What is the total length of closed storm drain that your agency owns and operates? U
- 8. What length was screened last year for illicit connections? 0
- 9. Describe the method used to screen your storm drains.

The majority of the storm drain system in the City of Westlake Village is under the jurisdiction of the LA County Flood Control District. Based on communication with Flood Control staff, it is our understanding that they conducted the field screening of all flood control channels and storm drains in their jurisdiction per NPDES Permit requirements for the discovery of any existing illicit connections.

- 10. Provide the reporting data for illicit connections as suggested in the following table (you may submit a spreadsheet from your database that contains the information).

Year	Total # reported/ identified	Total # investigated	# that conveyed exempt discharges or NPDES permitted	# that conveyed illicit discharges that were terminated	# that were removed	# that resulted in enforcement action	# that resulted in <i>other</i> actions
01/02	0	0	0	0	0	0	0
02/03	0	0	0	0	0	0	0
03/04	0	0	0	0	0	0	0
04/05	0	0	0	0	0	0	0
05/06	0	0	0	0	0	0	0

10/11	0	0	0	0	0	0	0
11/12	0	0	0	0	0	0	0

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

11. Explain any *other* actions that occurred in the last year. N/A
12. What is the average time it takes your agency to initiate an illicit connection investigation after it is reported? 24 hrs

a) Were all identified connections terminated within 180 days? N/A – None identified Yes No

b) If not, explain why.

None have been identified to date

13. Provide the reporting data for illicit discharges as suggested in the following table (you may submit a spreadsheet from you database that contains this information).

Year	Total # reported	Total # that were discontinued/ cleaned up voluntarily through enforcement and the source was identified	# that were cleaned up but the source could not be identified	# that resulted in no evidence of discharge	# that were determined to be conditionally exempt	# that were exempt or in compliance and the source identified	# that resulted in enforcement action
01/02	3	2	0	0	0	0	0
02/03	2	2	0	0	0	0	0
03/04	4	3	0	1	0	0	0

05/06	8	7	0	0	0	0	0
06/07	6	4	1	1	0	0	4
07/08	5	3	0	2	0	0	1
08/09	15	11	0	4	0	11	0
09/10	7	6	0	1	0	5	0
10/11	6	4	0	2	0	0	0
11/12	5	4	0	1	0	3	0

**Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4**

14. What is the average response time after an illicit discharge is reported? 2 hrs

a) Did any response times exceed 72 hours? Yes No

b) If yes, explain why.

N/A

15. Describe the your agency's spill response procedures.

The NPDES Coordinator is notified of the discharge-related service request by the administrative staff. The City Inspector is notified and responds to the location of the discharge, reporting his findings back to the NPDES Coordinator. The City Inspector will stop the discharge and give educational materials to the violator if caught-in-the-act. If the situation needs further follow-up, the NPDES Coordinator will conduct necessary investigations as necessary to identify and send written correction/education notices to the violator.

16. What would you do differently to improve your agency's IC/ID Elimination Program?

At this point this program is operating effectively.
--

17. Attach a list of all permitted connections to your storm sewer system.

N/A –There are no permitted connections to the city's storm sewer system

Los Angeles County Municipal Storm Water Permit (Order 01-182)
Individual Annual Report Form
Attachment U-4

V. Monitoring

Briefly describe any storm water monitoring activities that are not required by Order No. 01-182 that your municipality conducted, participated in, or received funding to conduct in the past fiscal year. These activities should correspond with the dollar amount you listed in Table 2.

The Malibu Creek Watershed was awarded Prop 13 Grant funding in a past fiscal year to conduct a watershed-wide monitoring program. The grant was in the amount of \$510,000. The watershed contributed a match amount of \$269,000 for a total monitoring program amount of \$779,000. The City of Calabasas is spearheading this effort on behalf of the watershed cities. The program was geared towards filling data gaps in existing monitoring data.

A Baseline report was completed and submitted during the 2nd quarter of the 2006-07 Fiscal Year. The final report was filed in FY07/08 and the project is closed out.

On March 11, 2008 a number of the Malibu Creek Watershed agencies subject to the Malibu Creek and Lagoon Bacteria TMDL began the Compliance Monitoring Program which conducts weekly sampling at a number of locations for bacteria indicators. The annual cost is around \$124,000.

Lastly, the City began a roving mobile carwash inspection program due to a number of these operations in town. The first year this program was implemented the inspector conducted 15 inspections, all of which now properly conduct BMPs or have not returned. This reporting year, no compliance issues have been found.

Los Angeles County Municipal Storm Water Permit (Order 01-182)**Individual Annual Report Form****Attachment U-4****VI. Assessment of Program Effectiveness**

- A. Attach a summary of the effectiveness of your storm water management program. This summary should include, at a minimum, the following:
1. An assessment of your agency's compliance with permit requirements, based on your responses to the questions in this form;
 2. Descriptions of any evaluation methods that your agency uses to determine the effectiveness of your storm water management program;
 3. A summary of the strengths and weaknesses of your agency's storm water management program;
 4. A list of specific program highlights and accomplishments;
 5. A description of water quality improvements or degradation in your watershed over the past fiscal year;
 6. Interagency coordination between cities to improve the storm water management program;
 7. Future plans to improve your agency's storm water management program; and
 8. Suggestions to improve the effectiveness of your program or the County model programs.
- B. On a scale of 1 to 10 (10 being full implementation of requirements by their deadlines), rate your municipality's level of compliance with Order No. 01-182.
10—full implementation of requirements by their deadlines
- C. List any suggestions your agency has for improving program reporting and assessment. None

IV. IDENTIFICATION OF EFFECTIVE/INEFFECTIVE BMPS:43

The Ballona Creek Watershed Management Committee
Annual Assessment 2011-12

I. Introduction:

The NPDES Municipal Storm Water and Urban Runoff Permit (Order 01-182) requires that an annual watershed-wide assessment be conducted by each Watershed Management Committee. This assessment is to be incorporated into the Unified Annual Report covering the period July 1 through June 30 of each year which is to be submitted to the Los Angeles Regional Water Quality Control Board no later than October 15 of each year.

The overall assessment of effectiveness includes:

- a) Summary of common activities conducted by all permittees;
- b) WMA BMP implementation;
- c) Identification of management measures proven to be effective and/or ineffective at reducing urban runoff pollutants and flow;
- d) Permittee level of effort, as indicated in their Individual Annual Report self evaluations; and
- e) Integrated summary of Monitoring Program Results.

This assessment addresses items a, b and c above. Item d is included in the individual annual reports. Item e is addressed by the Monitoring Report being prepared by the Principle Permittee. This assessment is based upon the information submitted by the individual municipal permittees of the Watershed specifically for this assessment between July 1, 2011 and September 10, 2012.

II. Summary of Common Activities:

Permittees of the Ballona Creek watershed continue to implement a wide variety of BMPs in accordance with the Stormwater Quality Management Program (SQMP). These include:

Active participation in the Watershed and EAC meetings;
Adoption of adequate legal authority;
Implementation of BMPs specifically for “Pollutants of Concern”;
Employee Training;
Erosion control BMPs at construction sites;
Street Sweeping;
Continued cleanout of catch basins on a regular basis;
Screening or cleaning of catch basins during and immediately after major events;
Illegal connection and illicit discharge control; and
Critical source inspections

While these activities are more fully detailed within the individual annual reports, individual permittee highlights include:

The Ballona Creek Watershed Management Committee
Annual Assessment 2011-12

III. Summary of Cities:

City of Beverly Hills

FY 2011/12 WMC Assessment for the City of Beverly Hills

Regional Watershed Works:

The Ballona Creek TMDL group started the ambient monitoring for the Metals and Toxics and Bacteria TMDL. The watershed has submitted the Implementation Plan to the Regional Board for review and approval. The City of Beverly Hills paid approximately \$138,000 to the cost of the TMDL MOAs. The watershed group is currently working on a new MOA for the three TMDLs it has been managing.

Employee Training:

One staff member attended three days' worth of training in FY 2011/12. Staff attended the annual CASQA event held in Monterey, California, September 26 -28. The conference theme was "Stormwater Management: Practical Solutions to Changing Conditions."

Catch Basin Inspection and Management:

At the end of FY 2011/12, the City has 513 catch basins surfgates. No additional catch basin surfgates were installed in this fiscal year due to the Stormwater Fund's annual operating deficit. These catch basin surfgates have deterred a total of 5 -tons of solids from going into the storm drain system. In addition, the enhanced six-day per week street sweeping program has collected a total of 1,200 tons of debris from entering the storm drain system. These numbers are significantly higher than previous fiscal years.

Public Educational Activities:

Like last year, budget constraints have prevented the program from publishing educational notes in the annual Consumer Confidence Report (CCR). Instead, staff utilized the City's website to inform stakeholders of the latest General Construction Permit requirements for SWPPP and SWPPP certified preparers. The City also utilized LA County's collateral

City of Beverly Hills

materials. The City used these materials for Earth Day, Woofstock and the Affair in the Gardens events.

The City of Beverly Hills provides tours to Beverly Hills High School students and UCLA Nursing Program. In these tours, the City educated these students on the importance of watershed quality and water resource issues.

The City continues to support LA County's PIPP program by donating \$3,700 in their media contribution fund.

Commercial/Industrial Inspection Activities:

Budget constraints contributed towards the eliminations of one Environmental Program Inspector in recent years. The remaining inspector inspected 106 restaurants this past fiscal year. 5 out of 5 retail gasoline stations were inspected and 10 out of 10 automotive service stations were inspected, as well. 100% of all facilities have been inspected during the permit cycle.

Construction Inspection Activities:

The Environmental Program Inspector visited 14 construction sites in FY 2011/12. 95% of these sites were in compliance during their 1st inspection and were 100% compliant in their second and follow up visits. These sites have implemented minimum BMPs. The success of our program is a result of our aggressive educational program and also require these BMPs during the plan check process.

Sanitary Sewer Overflow Management:

In FY 2011/12, there were 7 SSO events. All spills were responded to and mostly contained and returned to the sanitary sewer system. All SSO events were reported to the CIWQS database. The low number of SSO events is a result of our aggressive wastewater maintenance program which includes 7-day per week coverage.

Illicit Discharge and Illicit Connection Management:

In FY 2011/12, there were no illicit connections discovered and reported to the City. The illicit connection inspection is included during catch basin inspection.

The Ballona Creek Watershed Management Committee
Annual Assessment 2011-12

City of Beverly Hills

In FY 2009/10, there were 11 illicit discharge events. The majority of these events are due to cleaning agents in the sidewalk and human trash activities. There were occurrences of illegal pool discharge to the sidewalk. Since the inception of the program, there has been a steady decrease of illicit discharges in the city thanks to a proactive monitor activity conducted by all city field staff.

The Ballona Creek Watershed Management Committee
Annual Assessment 2011-12

City of Culver City

Culver City has complied and will continue to implement the MS4 NPDES Permit until the new version has been adopted. Given that FY11-12 was tough, economically, Culver City was able to sustain its storm water program.

Some highlights that staff worked on are:

- Prop 50 grant was decreased from \$1.25 million to \$1.1 million. Luckily the prices of the full capture devices have significantly gone down. This grant will install 672 full capture devices in catch basins throughout the City. It will also fund 4 rain gardens and place 50 trash and recycling bins in high trash volume areas.
 - The catch basin inserts have had a setback due to attaining LA County permits and sizing issues to the screens. Culver City is working with the County to push and have all units installed by FY12-13.
 - Of the 4 rain gardens, 2 are built and 2 are in design phase. The first built one resides in a residential area and treats drainage that once was flowing directly to Ballona Creek. The second built garden is located on the bike path of Ballona Creek, it is a much larger rain garden that was designed to handle the discharges from the elementary/middle schools.
 - The trash and recycling bins design have been selected and once the units are shipped, they will be placed appropriately throughout the City.
- The City hired a consultant to continue the commercial/industrial inspections; however, there were no inspections this year. Inspections will commence next year once the new permit is adopted.
- New public outreach materials are designed and awaiting approval from management to be released with the adoption of the new permit. The brochures will be used in conjunction with the inspections program.
- All stakeholders have signed all of the TMDL MOAs. Monitoring and special studies have been completed or will continue and the implementation phase will begin soon.
- Other aspects of the permit are sustained and each subsection will be upgraded and modified to comply with the new permit.

City of El Segundo

City of El Segundo

WMC Assessment Summary for 2011/2012

The primary mission of the City of El Segundo is to provide effective and responsive public services, which enhance the safety and quality of life in the community. As a result, the City takes a proactive approach to implementing storm water policies or procedures and the permit itself is viewed as a citywide responsibility with many departments working together as a team.

A large portion of the City's success with its storm water program can be contributed to the effort provided by its staff. All city employees are knowledgeable about the importance of eliminating stormwater pollution. They are very motivated, informed and educated in storm water activities. Staff is also effective at educating the public and promoting storm water BMP's by distributing fliers and brochures to residents, businesses and contractors. In addition, the Fire Department is very active with our Industrial Waste Permit Program and the Community Development and Building Safety Departments ensure that all construction activities are conducted within the guidelines of the permit.

Accomplishments and on-going efforts over the past year have included:

- The City performed enhanced street sweeping in commercial areas.
- The City continues to work on identified water quality projects that will be constructed as part of the Santa Monica Bay Beaches Bacteria Total Maximum Daily Load Implementation Plan. These projects will divert runoff from the ocean and conserve water.
- The City has prepared a best management practice "Help Keep Our Waterways and Oceans Clean" handout for all walk-in's at its City Maintenance Facility. The information is provided to inform residents and City staff how their everyday behaviors and activities can influence water quality. General tips and guidelines regarding landscaping and garden activities, pet waste, car washing, and household hazardous and electronic waste were covered, all of which can help prevent urban runoff and contaminants from reaching the storm drain system, and eventually the ocean. This publication is distributed throughout the City.
- The City has continued to promote and advertise the permanent S.A.F.E. Collection Center Hyperion Plant that is administered by the City of Los Angeles. This site has

The Ballona Creek Watershed Management Committee
Annual Assessment 2011-12

City of El Segundo

given residents an easy and convenient way to dispose of hazardous and electronic waste.

In conclusion, the City plans to continue to improve storm water quality by continued inspection, installing debris guards on catch basins in heavy use areas, public education, staff training and implementation of the TMDL's. The City will also continue to evaluate its program on an ongoing basis for ways to improve storm water quality.

City of Hermosa Beach

Hermosa Beach WMC Summary FY11-2

The City of Hermosa Beach is a small, historic beach town that encompasses only 1.4 square miles, with two miles of popular beaches and is home to over 19,500 residents. As a coastal city focused on surfing and other ocean-oriented activities as well as tourism, maintaining high water quality is an important issue for the City of Hermosa Beach. The City's residents are strongly supportive of proactive environmental measures and actions to protect water quality and the environment. City staff is innovative, progressive and strongly committed to protecting water quality.

Notable accomplishments and highlights of our program include:

A new city ordinance (H.B.M.C. Section 8.40.020) established smoke-free zones at: all public parks; Pier Plaza, the heart of the city's downtown; the Hermosa Beach Pier; outdoor dining areas, including within five feet of the outdoor dining areas; the Strand, which is the sidewalk and bike path adjacent to and running the full length of the beach; the Greenbelt, which is the pedestrian path running the length of the City between Valley Drive and Ardmore Avenue, and City-owned public parking lots. Smoking had already been prohibited on the beach, in city buildings and inside of restaurants.

The City of Hermosa Beach has secured a \$410,000 grant from the state's Strategic Growth Council to create a comprehensive, long-term plan for reducing and eventually eliminating the city's carbon footprint. The funding will be used to hire experts who will update and integrate the city's General Plan and Coastal Land Use Plan to create a "Comprehensive Blueprint for Sustainability and a Low Carbon Future."

The City has completed the final report on the Phase I Hermosa Strand Infiltration Trench, an award-winning full-scale pilot project to evaluate the effectiveness of subsurface infiltration on the beach as an alternative to low flow diversions to the sanitary sewer for compliance with Bacteria Total Maximum Daily Loads. The system effectively removes the bacteria load from the diverted runoff thereby eliminating the bacterial load to the shoreline from the diverted runoff and eliminating REC-1 exceedances associated with discharges from the storm drain during dry weather so long as the system is operating properly. During the first twelve months of operation, alone, the Phase I Hermosa Strand Infiltration Trench system diverted and filtered more than 1.6 million gallons of dry weather and some wet weather runoff from the relatively small but intensely developed drainage area of the Pier Avenue storm drain, effectively removing 100% of the bacteria load from the diverted water. A presentation on the project's

City of Hermosa Beach

effectiveness was delivered at the annual Headwaters to Ocean Conference in May 2012 held in San Diego.

The City completed the effectiveness assessment report on the **Pier Avenue Improvement Project**, a “green” multi-benefit streetscape improvement which retrofits the City’s main street to capture and treat stormwater/urban runoff from residential areas and commercial development in the downtown corridor (36-acre drainage area). It was determined from monitoring data that dry weather flows were eliminated through infiltration and wet weather runoff flows were estimated to be reduced by as much as 71% throughout the project area.

The City installed **certified trash full capture exclusion devices** on 14 City-owned catch basins within the downtown commercial area (four years in advance of the first milestone in the newly adopted Santa Monica Bay Nearshore and Offshore Marine Debris TMDL).

Pier Avenue Improvement Project, Hermosa Beach, CA

In 2010 the City adopted low impact development (LID) requirements as a customized amendment to the California Green Building Code. These LID requirements apply to new

City of Hermosa Beach

development commercial and residential projects regardless of size (i.e., even new development projects not subject to SUSMP under the MS4 Permit are subject to these requirements.

Hermosa Beach has instituted a Water Conservation and Drought Management Plan Ordinance and a Water Efficient Landscape Ordinance that far exceeds State requirements. The City actively enforces the water conservation ordinance which reduces dry weather runoff to Santa Monica Bay as a result of the reduction in outside water use and waste.

The City of Hermosa Beach has instituted a Green Matrix of requirements for special events in the City. The requirements include measures to:

- Reduce waste and single-use items
- Limit and reduce the size of handouts and flyers
- Control litter, contain wastes and prohibit hosing of surfaces
- Increase recycling and solid waste diversion rates
- Provide educational outreach to the public

The section of Hermosa Avenue which runs parallel to the beach from 27th to 35th Streets is equipped with a series of seven (7) filter/infiltration boxes designed by the City's engineering staff to intercept, filter, and infiltrate low flows conveyed down side streets from the areas east of Hermosa Avenue prior to entry into catch basin inlets on Hermosa Avenue.

The City's Dog Regulations include a leash law for all public and private property. Owners are required to carry a visible doggie bag when walking their dogs and must immediately remove and properly dispose of feces. The City has installed and maintains dispensers for pet waste collection bags in municipal parks and along the linear greenbelt. Dogs are prohibited on the beach.

The City has installed Drain Pac® inserts on 31 City-owned catch basins plus an additional 10 County-owned basins. The City cleans both the City-owned catch basins and the ten County-owned basins equipped with Drain Pac®.

The County through grant funding has installed debris excluders on 35 high priority catch basins in the City's commercial district along Hermosa Avenue and Pier Avenue. This has reduced the accumulation of trash and debris in the catch basins and the frequency of required catch basin cleaning. The debris excluders also increase the effectiveness of street sweeping.

The City plumbing code requires grease removal systems for food service establishments

City of Hermosa Beach

(FSEs) and provides for annual inspection of the grease recovery systems. Only facilities which do no frying of food can be exempted, e.g., coffee shops, or sandwich shops with no grilling.

The City of Hermosa Beach cooperates with other agencies on a number of other initiatives:

The City of Hermosa Beach, along with the cities of Manhattan Beach, Redondo Beach, and Torrance in cooperation with the Santa Monica Bay Restoration Commission, has implemented the Clean Bay Restaurant Certification program targeting food service establishments with exposure to stormwater. The agencies developed a comprehensive 28-point storm water inspection checklist that requires 100% compliance in order for the facility to be awarded a Clean Bay Restaurant Certification by the Santa Monica Bay Restoration Commission—this checklist far exceeds the minimum requirements of the current MS4 Permit as does the frequency of inspection which is annual instead of twice in five years under the permit. Compliance with the FOG ordinance is an additional provision of earning the Clean Bay Restaurant Certificate.

The City contributed \$70,000 to jointly fund implementation activities over several years under the Jurisdictional Groups 5 and 6 (J5&6) Implementation Plan which in combination with contributions from other J5&6 agencies totaled \$591,028 in joint implementation activities. While the implementation plan focuses ostensibly on winter dry weather and wet weather compliance measures, benefits are also realized for summer dry weather. The J5&6 Implementation Plan is a three-pronged approach incorporating programmatic/institutional elements, source identification and control, and structural BMP siting.

Jurisdictional Groups 5 & 6 also conduct ongoing joint monitoring under the Coordinated Shoreline Monitoring Plan through a memorandum of agreement.

The City hosts an annual joint household hazardous waste and electronic waste collection event in cooperation with the County of Los Angeles and also promotes the City of Los Angeles' permanent collection centers. The City supports the joint Clean LA campaign headed by the County of Los Angeles

The City's representative participates in the monthly Executive Advisory Committee of the Los Angeles County Municipal Stormwater Permittees, the quarterly Santa Monica Bay-Ballona Creek WMC meetings, the quarterly countywide public education coordination meetings, and monthly Jurisdictional Group 5 & 6 coordination meetings to ensure that the City stays abreast of important storm water/NPDES issues.

The Ballona Creek Watershed Management Committee
Annual Assessment 2011-12

City of Hermosa Beach

The City is also an active participant in the South Bay Cities Council of Governments and its committees, working groups, task forces and other special meetings. Ocean Friendly Landscaping Workshops are conducted through cooperation with the South Bay Environmental Services Center (a non-profit center established by the South Bay Council of Governments), West Basin Municipal Water District and Surfrider Foundation.

The City is a voting member of the Santa Monica Bay Restoration Commission Watershed Advisory Council, and the Mayor of Hermosa Beach is currently serving as an alternate member of the Governing Board of the Santa Monica Bay Restoration Commission.

The Ballona Creek Watershed Management Committee
Annual Assessment 2011-12

City of Los Angeles

Ballona Creek and Santa Monica Bay Watershed Management Committee **Annual Assessment 2011-2012**

The City of Los Angeles is a member of the Ballona Creek and Santa Monica Bay Watershed Management Committee. Los Angeles follows a multifaceted approach to comply with the provisions of the Stormwater NPDES Permit with increased emphasis placed on complying with newly established as well as anticipated TMDL standards.

- All the Stormwater Program’s social media elements experienced growth during this reporting period. The program redesigned and re-launched its web site (www.LAStormwater.org) and experienced more than 4 million hits. The LA Stormwater Group on Facebook currently boasts 1,793 fans, and a blog (www.LAStormwater.org/blog) receives regular posts from interested stakeholders with the program publishing 87 educational posts. The City’s quarterly e-newsletter, entitled LA Stormwater, continues to experience an increase in the number of subscribers. In 2011, the total number of e-newsletter subscribers was 7,279.
- During this reporting period, the program presented educational assemblies to 9,669 elementary-aged students at 69 schools. On June 7, 2012, the City co-sponsored the 19th annual Kids Ocean Day Beach Clean-Up at Dockweiler Beach with the Malibu Foundation for Environmental Education, Keep Los Angeles Beautiful and the California Coastal Commission. More than 5,000 Los Angeles area students cleaned the beach, collecting several tons of trash and creating a message in the sand (a picture of a shark with the message “Defend the Sea”). Kids Ocean Day received coverage on television, radio, print and online media throughout the world, in the United States, England, Brazil and the Philippines.
- Beginning in 2004, the City has committed \$128.8 million from the City’s Proposition O – Clean Water Bond for nine projects in the watershed designated to improve water quality as well as provide additional benefits. The largest of these projects are the upgrades of the low flow diversion facilities and three projects that target wet weather capture and treatment, all with the goal of assisting the City in achieving compliance with the Santa Monica Bay Beaches Bacteria TMDL standards.
Projects that completed construction during this reporting period:
 - Mar Vista Recreation Center Stormwater BMP
 - Santa Monica Bay Low Flow Diversion (SMB LFD) Upgrades Package #1 (Marquez Ave., Bay Club Drive, Thornton Ave., Venice Pavilion, and Imperial

City of Los Angeles

- Hwy. LFDs)
 - SMB LFD Upgrades Package #2 (Temescal Canyon LFD)
 - SMB LFD Upgrades Package #4 (Santa Monica Canyon and Palisades Park LFDs)
 - Westside Park Rainwater Irrigation
- Projects in construction at the close of the reporting period:
- Penmar Water Quality Improvement Phase I
 - SMB LFD Upgrades Package #3 (Coastal Interceptor Relief Sewer)
 - Temescal Canyon Park Stormwater BMP Phase I
- Projects in planning/design at the close of the reporting period:
- Penmar Water Quality Improvement Phase II
 - SMB LFD Upgrades Package #3 - Phase II of the Coastal Interceptor Relief Sewer
 - Temescal Canyon Park Stormwater BMP Phase II
 - Westchester Stormwater BMP
- The City installed additional 1638 new catch basin opening screens to prevent the discharge of trash into the Ballona Creek. The City is already on target of having reached over 90% reduction in trash discharges into the Ballona Creek as required by the Trash TMDL by September 2012.
 - As specified in the respective Coordinated Monitoring Plans, the City continued monitoring of: a) bacteria along Santa Monica Bay shoreline; b) bacteria in Marina del Rey Harbor; c) bacteria in Ballona Creek, Ballona Estuary, and Del Rey Lagoon; d) metals in Ballona Creek; and e) toxics in Ballona Estuary. These monitoring activities are being cost-shared by all TMDL responsible agencies. In July 2011, the City contracted the services of Brown & Caldwell to provide permanent power to the Ballona Creek automatic water samplers. While currently still operating on battery power, these samplers have been fully operational for collecting flow-weighted composite samples during storm events of the 2011/12 wet season. It is expected that permanent power will be in place prior to the start of the 2012/13 wet season. The City continued the collaboration with the County of Los Angeles and the other Marina del Rey watershed agencies regarding the implementation of the Coordinated Monitoring Plan for the Marina del Rey Toxics TMDL. In addition, the Marina del Rey watershed agencies submitted two special studies to the RWQCB that are required by the Toxics TMDL: the Partitioning Coefficient and the Low Detection Level Special Studies.
 - In June 2012, the City resubmitted the Implementation Plan for the Ballona Creek Estuary Toxic Pollutants TMDL after receiving comments from the RWQCB in March 2012. The draft Implementation Plan for the Marina del Rey Harbor Toxic Pollutants

The Ballona Creek Watershed Management Committee
Annual Assessment 2011-12

City of Los Angeles

TMDL, addressing the upstream portion of the watershed that is under the jurisdiction of the City, Culver City and Caltrans, was submitted in March 2011 and is awaiting review by the RWQCB before final submittal.

- The City continues to pursue grant opportunities and partnerships with non-City agencies to implement “green” infrastructure projects. In August 2011, the Santa Monica Bay Restoration Commission awarded \$510,000 in grant funding for the University Park Rain Gardens project. The City is partnering with the Los Angeles Conservation Corps, TreePeople, the University of Southern California (USC), and others to install rain gardens that will capture, infiltrate, and biofiltrate dry weather and a portion of stormwater runoff from streets in the vicinity of USC.

City of Manhattan Beach

Manhattan Beach WMC Summary 2010-11

The City of Manhattan Beach fronts 2.1 miles of southern California beaches with a scenic 928-foot long fishing pier. There are 48 acres of parkland in addition to the 21-acre Manhattan Beach Parkway in the 3.88 square mile city. According to the 2010 census, approximately 35,135 people reside in Manhattan Beach. As a coastal city focused on surfing and beach-oriented recreational activity, maintaining high water quality is very important to its residents and City officials.

Specific program highlights and accomplishments include:

On July 14, 2011 the City of Manhattan Beach was notified that it had prevailed in its effort to ban plastic bags through a unanimous California Supreme Court decision in its favor against a challenge by the Save the Plastic Bag Coalition. The City's plastic bag ordinance began implementation on January 14, 2012.

On August 2nd, 2011 the City Council approved an ordinance expanding the areas where outdoor smoking is prohibited to include the Strand walkway adjacent to the beach and Veterans Parkway (the Valley/Ardmore Greenbelt). Previously in 2004 the City Council

City of Manhattan Beach

had prohibited smoking on the beach, the pier and at recreational facilities such as parks, athletic fields and tennis and basketball courts.

The City has completed design of the Greenbelt Infiltration Trench project being funded in part by a grant from Prop 84 Santa Monica Bay Restoration Commission. The project will utilize the linear greenbelt parkland which runs through the City of Manhattan Beach (City) to intercept and infiltrate dry weather and wet weather low flows from existing storm drains to effectively retrofit 55 acres of fully developed residential area.

The Post Office Demonstration Garden as proposed by the City's Environmental Task Force redesigned the landscape surrounding the Manhattan Beach Post Office to create a demonstration garden with high visibility for the community. The City partnered with the Leadership Manhattan Beach 2012 class to fully realize the Sustainable Garden project, which demonstrates the principles and practices of the City's Landscape Sustainability Audit and Community Mulch programs. The Sustainable Garden project was installed in the spring of 2012; the design utilizes recycled materials, climate-appropriate plants, and water-wise irrigation materials to create a beautiful example of sustainable landscaping.

Ten (10) CDS® gross pollutant hydrodynamic separators are installed on major storm drains within the City. The City has also installed approximately sixty (60) debris screens on catch basin openings that have historically required frequent cleaning (Priority A). These screens have significantly reduced trash deposited into catch basins and frequency of catch basin cleaning and together with the CDS units have reduced the discharge of trash and debris to the ocean.

Seven (7) municipal parking lots are retrofit with porous paving. For the 128,226 square feet of porous paving installed, an effective pervious area of 892,951 square feet was achieved.

The 11,000 square feet of median between Aviation Boulevard and Aviation Way is planted with native/drought-tolerant plants and is serviced by a water-saving drip irrigation system. The project eliminates 100% of dry weather runoff.

The City's Fats Oils and Grease (FOG) ordinance requires the installation of grease interceptors and their proper maintenance for all food service establishments that have the potential to generate FOG, and prohibits food grinders. Discharges from food grinders and grease to the sanitary sewer system can be significant contributors to sewer line clogs and sanitary sewer overflows.

City of Manhattan Beach

Manhattan Beach adopted a strict water conservation ordinance that became effective July 2, 2009. This water conservation reduces dry weather runoff to Santa Monica Bay as a result of the reduction in outside water use and waste.

The City has installed and maintains pet waste collection stations equipped with disposable bags for collecting and disposing of pet waste in municipal parks and along the linear greenbelt with a high frequency of use by residents with dogs. The City strictly enforces its leash law in all public parks—although ostensibly for public safety, this law has the secondary effect of reducing the likelihood that a dog will leave a deposit without the owner's knowledge.

The City of Manhattan Beach maintains more than 450 trash receptacles in municipal parks and the public right-of-way. The City utilizes trash receptacles with lids—usually the type with a small hole in the center that allows the user to deposit trash but prevents trash from being blown out of the trash can by wind and also deters birds and other animals from spreading trash. The City also maintains more than 125 additional receptacles for recyclable glass, plastic and aluminum beverage containers along the Strand, the Pier and adjacent parking lots, in the downtown Manhattan Business District and in the North End Business District.

The Manhattan Village Soccer Park is surfaced in synthetic turf which eliminates the need for fertilizer, pesticides or irrigation, thereby reducing pollutant loads and nuisance flows. Dry methods (vacuuming) are used to maintain the fields.

The City of Manhattan Beach cooperated with other cities on a number of activities:

The City expended \$176,913 of its limited funds over several years to jointly fund implementation activities under the Jurisdictional Groups 5 and 6 (J5&6) Implementation Plan which in combination with contributions from other J5&6 agencies totaled \$591,028 in Phase I and Phase II implementation activities. The J5&6 Implementation Plan is a three-pronged approach incorporating programmatic/institutional elements, source identification and control, and structural BMP siting.

Jurisdictional Groups 5 & 6 also conduct joint monitoring under the Coordinated Shoreline Monitoring Plan through a memorandum of agreement.

The City's representative participates in the monthly Executive Advisory Committee of the

The Ballona Creek Watershed Management Committee
Annual Assessment 2011-12

City of Manhattan Beach

Los Angeles County Municipal Stormwater Permittees, the quarterly Ballona Creek WMC meetings, the quarterly Countywide public education coordination meetings, and the monthly Jurisdictional Group 5 & 6 coordination meetings.

The City of Manhattan Beach is also an active participant in the South Bay Cities Council of Governments and its committees, working groups, task forces and other special meetings. The City participates in the Green Task Force of the South Bay COG which is an advisory group that serves as a clearinghouse for policies, programs and projects on energy efficiency, air quality, resource conservation and climate action.

The City of Manhattan Beach hosts the quarterly Santa Monica Bay-Ballona Creek WMC meetings and the City's representative serves as the watershed representative to the Executive Advisory Committee of the Los Angeles County Municipal Stormwater Permittees. The City also participates in the quarterly Countywide public education coordination meetings, and the monthly Jurisdictional Group 5 & 6 coordination meetings.

City of Palos Verdes Estates

Palos Verdes Estates WMC Summary FY11-12

The City of Palos Verdes Estates is a small city of 14,000 residents located on the Palos Verdes Peninsula. The City is primarily residential with a small commercial area consisting of small office spaces and restaurants. There are no industrial areas located within the City. The City of Palos Verdes Estates (City) has implemented programs that are consistent with the County's Storm Water Quality Management Plan (SQMP). The City is in full compliance with all applicable Permit requirements.

Highlights of our program include:

The City is implementing a plan to install full capture devices to achieve compliance with the Machado Lake Trash TMDL. Thirteen (13) Connector Pipe Screens have been installed to date in catch basins throughout the City. In order to minimize the litter/trash discarded on City streets, the City prohibits the use of top-loading trash trucks in the City. Any leaks and spills generated by trash trucks may be subject to City fines.

The City completed the required two inspection cycles of commercial facilities (there are approximately ten within the city, mostly restaurants) during the permit term and continues to inspect its commercial facilities every other year or more often if necessary.

All City landscaping projects are designed with drought tolerant, native plants. The City has a full-time forester who reviews all landscape plans.

The City has developed and implemented code enforcement measures to reduce irrigation/landscape overspray. The City has begun issuing code warnings and violations to residents, and businesses, that allow overspray into storm drains. The City has noticed a reduction of dry-weather flow rates and volumes as a result of this effort.

The City continues to implement an aggressive educational and outreach program. Ongoing educational/outreach efforts include:

- The City maintains an environmental webpage within the City's website, featuring storm water and pollution prevention information. The environmental webpage provides valuable information to the public regarding storm water best management practices, links to other environmental websites, and information on pollution prevention and recycling. In addition, information on storm water pollution and other environmental issues are periodically

City of Palos Verdes Estates

highlighted in the City's newsletter.

- Each year, the City participates in at least two community events. Depending on the event, stormwater outreach may utilize an EnviroScape™ Stormwater Model to educate residents on storm water pollution. The model is an interactive tool which demonstrates how storm water pollution enters the storm drain system from various land uses and is well received by the community.
- Palos Verdes Estates also hosts a Coastal Clean-up Day site and utilizes the event to distribute informational materials to the community.
- The City regularly distributes flyers for Household Hazardous Waste, E-waste, and for all nearby roundup events via public counter, hardware store, and used oil recycling center.
- The City actively works with local schools to promote environmental and stormwater education. Staff provide assistance to the local high school in implementing its recycling program and is working with students to develop an environmental awareness calendar.

The City cooperates with other agencies on a number of initiatives:

The City in cooperation with sister cities on the Palos Verdes Peninsula this year completed the first eleven months of monthly monitoring under the Palos Verdes Peninsula Coordinated Monitoring Plan for the Machado Lake Nutrient TMDL.

The Palos Verdes Peninsula Cities Implementation Plan for the Machado Lake Nutrient TMDL includes joint coordination of public outreach programs, e.g., the incorporated cities on the Palos Verdes Peninsula ran a quarterly full-color add in the Palos Verdes Peninsula News on stormwater pollution prevention targeting source control of nutrient pollution.

Participation in Jurisdictional Group 7 coordination meetings to work together to protect beach water quality along the Peninsula shoreline--three of the shoreline monitoring locations on the Palos Verdes Peninsula were listed on Heal the Bay's 2011-12 Honor Roll including Bluff Cove adjacent to the City of Palos Verdes Estates.

The City participates in the required watershed management committee meetings for Santa Monica Bay-Ballona Creek Watershed as well as additional meetings among the Peninsula

The Ballona Creek Watershed Management Committee
Annual Assessment 2011-12

City of Palos Verdes Estates

cities and with the Dominguez Channel Watershed Management Committee. These meetings provide cities an opportunity to discuss important information regarding Permit issues and to address issues of problems and concerns encountered while implementing individual programs.

The City of Palos Verdes Estates also contributed funding to the County-wide storm water pollution prevention campaign and participated in the County-led quarterly LA County Public Outreach Strategy meetings.

City of Rancho Palos Verdes

The City continues to remain in compliance with MS4 permit requirements by implementing the tasks designated in the permit on schedule and meeting all required deadlines. In addition, the City continues to collaborate with other outside agencies to mitigate stormwater pollution to the maximum extent practicable. The City has also been very proactive in outreaching to the public, below is a list of outreach efforts the city made during this reporting period:

- A community earth day event was hosted on April 22 by a homeowner association in the City to promote the awareness of green lifestyles/products and natural world. The news about the event was published in the PV News on April 19.
- The annual Household Hazardous Waste /E-waste roundup event (May 5, 2012) was well promoted to its residents via city's newsletter, City website, list server emails, banners, Peninsula Newsletter For Active Seniors, Palos Verdes News articles, Peninsula People magazine, and the City's waste hauler newsletter mailer. As a result, 1525 households were served and more than 15,800 lbs of household hazardous waste, as well as hundreds of gallons of used oil were properly recycled.
- The City continued to implement the Clean Bay Restaurant Certification Program in partnership with the Santa Monica Bay Restoration Commission. During this reporting period, 31 restaurants were awarded with the certification.
- Rancho Palos Verdes continued its efforts, along with the County's, to implement the annual restaurant outreach program. The program consists of annual outreach to all restaurants through a mailer which emphasizes sidewalk, patio & parking lot cleaning and maintenance management practices.
- The City continued to be the lead agency in Jurisdiction 7 for the Santa Monica Bay Bacteria TMDLs, and will continue these efforts in the upcoming reporting year.
- The City was active in the Peninsula Cities TMDL work group which developed Monitoring and Implementation Plans for the Machado Lake Nutrient TMDL this year. As part of the Implementation Plan, the Peninsula Cities are developing a joint outreach as addressing potential nutrients sources.
- The City's Stormwater and Used Oil programs collaborated to produce an advertisement with tips to prevent stormwater pollution. The ad was published in the Palos Verdes News on March 29.

The Ballona Creek Watershed Management Committee
Annual Assessment 2011-12

City of Rancho Palos Verdes

- The City's Stormwater and Used oil programs collaborated to produce an advertisement with tips to prevent stormwater pollution. The ad was published in the annual Concours d'Elegance Car Show magazine in September 2011.
- The City continued to air informational programming on its local station, Channel 33 to inform residents about the stormwater related issue.
- The City promoted various recycling events and composting workshops throughout the year in city newsletter, City website, Palos Verdes News articles, press releases, list server emails, banners, as well as in its waste hauler's newsletter.
- The City contributed to the County stormwater pollution media campaign.
- The City continuously promotes the use of the Gaffey SAFE center for the proper disposal of HHW and e-waste via the City website, newsletter, and hauler newsletter and at the City's various events. The center is open every weekend.
- The City has participated in 4 events throughout the year
 - 4th of July Celebration (7/4/2011)
 - Annual Coastal Clean Up Day (9/17/2011)
 - Whale of A Day (3/3/2012), and
 - Pet Vaccination Clinic (5/23, 2012)

City of Redondo Beach

City of Redondo Beach
Storm Water Program Summary Highlights
The Watershed Assessment Report
FY 2011-12

SMBBB TMDLs

- The City is the lead agency for Jurisdictions 5&6 of the SMBBB TMDL, a group effort that developed the joint monitoring and the Implementation Plan to comply with the TMDL's. The Implementation Plan includes programmatic and structural programs' BMPs. These tasks have been individually distinguished and separately assigned with specific deliverables for proper implementations.
- Programmatic tasks such as outreach to schools, graphic art contest, conducting a survey, design of inspection manual, inspectors round table, Parks and Recs activities evaluation and checklist, website design, compiling a list of available stormwater educational videos and DVDs, identifying appropriate speakers, designating targeted audience, developing restaurant and pet waste BMP brochures, website design, installation and monitoring it have been the main accomplishments of the Implementation phase of the Plan.
- The City has also started implementing the structural BMP tasks of the Plan by conducting initial studies and obtaining samples to determine the most adequate catchments for such BMPs. The study included samples of dry weather at various locations of the storm drain system within the Jurisdictions as wells as samples near the sanitary sewers to determine any possible leakages. The J5/6 agencies have already completed Phase I of the Site-Specific Structural BMP management approach of the IP utilizing available grant funding to pilot various structural BMPs. Consistent with Phase II of the Site-Specific Structural BMP management approach of the IP, evaluation of the performance of these pilot projects were completed. Based on experience with the BMP pilot projects, the agencies decided to move forward with Phase III of the Structural BMP management approach utilizing infiltration-based structural BMPs in the two high priority drainage areas if funds are available. A structural BMP siting study is underway and the study was completed in FY 11/12.. The structural BMPs for the IP are a major component in achieving compliance with the SMBBB TMDL. However, it is anticipated that the Programmatic Solutions and Source Identification and Control components will also help achieve compliance through less intrusive, less expensive routes and therefore it should not be necessary that 100% compliance be achieved with the Structural BMPs

City of Redondo Beach

alone. A full report of findings is available at the City.

- The City has obtained a permit from the Los Angeles County Beaches and Harbors Department and installed a Dry-Weather diversion facility to stop all discharges from the Sapphire Street storm drain during dry weather year around. This facility was made operational in July 2010.
- Rain Water Harvesting is an important means of helping meet the water needs of Southern California. The City operates a facility that captures rain since May 2011. This facility can divert and capture up to six million gallons of rain water a year for irrigation use or infiltration into the underground soils. Diversions from the storm drain system will reduce the amount of rain water, along with the bacteria and other pollutants it carries, from being discharged into the Santa Monica Bay – thus improving water quality and reducing the number of days bacteria concentrations in the water exceed healthful standards. Since December 2011, when diversion recorder keeping began, the facility has diverted 1.6 million gallons of rain water and urban runoff.
- The City worked with the Sanitation District and the Los Angeles Conservation Corps to conduct a study of ocean water quality around the pier in order to identify the source or sources of bacteria. The study was completed in February 2010
- The City has installed thirty eight (38) smart manhole covers that monitor the sewer level and alarm the City when the level rises.

The “Restaurant Certification Program”

- This program was launched and developed. The city jointly with the Santa Monica Bay Restoration Commission and the neighboring agencies implemented the “Clean Bay Restaurant Certification Program”. This program has been designed to target restaurants and modify the operator’s behaviors by providing incentives to encourage the implementation of appropriate BMPs.
- The City has inspected the restaurants regularly with the goal of visiting each establishment at least twice per year. This is far above and beyond the NPDES permit requirement of once every thirty months. The critical sources have also been the target establishments to be inspected by the City at a minimum of once every 30 months.
- Clean Bay Restaurant Certification Student Participation program- Participants on this field trip included 26 students from a Redondo Union High School AP Environmental

City of Redondo Beach

Science class and 8 students from Perras Middle School's Club Earth. Each student group was taught storm water quality management in the form of Best Management Practices for a restaurant's indoor and out door areas. Fats, oils and grease handling included use of grease removal devices and proper storage and recycling of used fry oil. Runoff pollution control included maintaining trash bins, storage areas and parking lots. This field trip helped the students understand, appreciate and remember the importance of pollution prevention. The restaurants were representative of corporate owned establishments (McDonald's, Panda Express, Subway) as well as small family owned (The Standing Room, Ham Supreme Shops). The students were given posters and brochures for further class room discussion and reinforcement of practices.

Trash Reduction BMPs

- The City has received a state grant for \$600,000 to install structural BMPs designed to reduce the accumulation of trash. The construction of the first BMP continuous deflection system (CDS) was completed in November of 2002. A second CDS unit was installed in Oct. 2003. A Third CDS unit was installed in April 2005 and a fourth was installed in May 2005.
- The \$350,000 State Grant was received for improving water quality around the City's Municipal Pier. Improvements funded by the grant include replacing sewer mains under the pier, installation of a fish cleaning station, constructing covered trash enclosures and replace trash receptacles on the pier. Installation of a low flow diversion on a storm drain that discharges under the pier was completed in April 2005.
- The City completed the installation of two pilot projects in the harbor area. These projects include the installation of trash filters in the drain inlets and re-routing roof

City of Redondo Beach

gutters on the pier diverting runoff from direct discharge in to the ocean. Construction was completed in February 2010.

Public Education BMPs

- The City has continued the pet waste awareness program in conjunction with the animal control and pet related businesses (i.e. veterinarians, pet stores). The City's website provides helpful tips for the pet owners. The City has an on-going program to hand out free pet waste collection bags at the City Engineering Counter.
 - The City's Quarterly Newsletter ads published information regarding the City's storm water program as well as promoting the various related events and helpful tips.
 - The Mayor and City Council formed a Water Quality Task Force in August 2005 made up of a diverse cross section of the community include individuals from teachers, youth, boaters, non-profit, general public, chamber of commerce, and harbor businesses. The Task Force is to provide the City Council with recommendations that will address water quality in the harbor and other waterfront areas of the City.
 - The Green Task Force was established in January 2007, for the purpose of improving community knowledge of environmental topics and encouraging practices which protect the environment. This task force has been served as a model in the region which considers the tremendous growth of interest in green issues and environmental concerns.
 - The City council approved an increase in the wastewater sewer user fee. This fee increase will help fund new State sewer system operational mandates to reduce sewer overflows.
 - The City adopted the Non-Smoking Beach Ordinance
-

City of Rolling Hills

City of Rolling Hills WMC Summary 2011-12

The City of Rolling Hills is a private, entirely residential community of single-family homes located on the Palos Verdes Peninsula. The City has a very small population of 1,860 residents in three square miles. There are just 684 single-family one-story homes, only 15 undeveloped lots remain with an additional 13 undevelopable lots in a landslide area. Minimum lot size is 1 acre; the average lot size is 2.7 acres. There is no public infrastructure, and no City-owned or maintained storm drains, roads, sewers, sidewalks or curb-and-gutter. Accordingly, many of the NPDES Permit requirements do not apply to the City, however the City of Rolling Hills is in full compliance with applicable permit requirements.

Highlights of the City's stormwater pollution prevention programs include:

Rolling Hills, as a municipality and in its geography, is unique. The City is by design a low density, low impact, rural residential community with primary drainage conveyed via natural canyons. Dry weather flows and small rainfall events are infiltrated within the natural soft-bottom canyons which are the primary drainage system. Storm water from private property drains into largely undisturbed heavily vegetated natural soft bottom canyons; there is no continuous improved storm drain system throughout the City. Source control is the primary means available to the City for maintaining and improving water quality; structural control/treatment devices are neither feasible nor environmentally appropriate in natural canyons nor does the City have easements in the canyons.

The City of Rolling Hills has now completed a second year of monitoring in accordance with the Trash Monitoring and Reporting Plan. The results for the second year of monitoring demonstrate that the City's current BMPs (the City's low-impact characteristics and routine maintenance practices) achieved 99.96% reduction of trash from annual trash generation rate and 99.98% load reduction when measured against the baseline waste load allocation. This additional data confirms previous results which established that the City is not now and has not previously been contributing trash to Machado Lake and that the City of Rolling Hills is not contributory to the 303d listing of Machado Lake nor the Santa Monica Bay Marine Debris listing.

The City of Rolling Hills is a hillside community and some areas of the City are prone to unstable geology and landslides, which limit onsite retention of stormwater beyond that which can be achieved by preserving pervious area and natural topography and vegetation. The City's Zoning Ordinance contains strict standards for development ratios on each property. Only 40% of the net lot area of a lot may be disturbed for construction. Only 35% of the net

City of Rolling Hills

lot area may be developed with impervious surfaces, including all structures, patios and other paved areas. Given that the minimum lot size in the City is one acre, this provision promotes infiltration of storm waters into the ground instead of onto streets. Residential roof runoff is also required to be diverted to vegetated areas before discharge.

The City's Zoning Ordinance precludes large impervious surfaces, i.e., driveways may not cover more than 20% of the area of the yard in which they are located; uncovered motor courts/parking pads may not cover more than 10% of the yard in which they are located. Tennis and sports courts are encouraged to have pervious surfaces.

The City encourages residents to install pervious surfaces when landscaping or installing/reconstructing driveways. Many residents have resurfaced their driveways with porous material. Stable access-ways may not be entirely paved and are encouraged to be 100% gravel.

City ordinance requires that residential solid waste containers be stored within a trash enclosure located in the side or rear yard. Trash enclosures must be designed with a solid wood fence or concrete wall six feet high on a cement or asphalt base with self-locking gate. Manure collection and recycling service for horse owners is available through the City's franchise hauler. The City's franchise solid waste hauler collects manure at no extra charge to residents. Alternatively if a larger bin for manure storage and hauling is needed, the solid waste franchise hauler will provide a special bin for such purpose for an additional fee.

Community association maintenance staff picks up any stray trash observed along roadsides or trails during daily rounds and every Friday conducts systematic patrol of roadways and trails specifically to collect stray litter or trash.

The City of Rolling Hills' newsletter is prepared by staff and mailed to every residence twice per month and includes frequent articles on storm water pollution prevention as well as related environmental issues. Brochures and flyers on various storm water best management practices (BMPs) are also available at the City Hall counter and at the Rolling Hills Community Association offices.

The City of Rolling Hills cooperated with other cities on the Palos Verdes Peninsula in a number of activities including:

- The City in cooperation with sister cities on the Palos Verdes Peninsula this year completed the first eleven months of monthly monitoring under the Palos Verdes

The Ballona Creek Watershed Management Committee
Annual Assessment 2011-12

City of Rolling Hills

Peninsula Coordinated Monitoring Plan

- Implementation of the Palos Verdes Peninsula Cities Implementation Plan for the Machado Lake Nutrient TMDL with joint coordination of public outreach—the incorporated cities on the Palos Verdes Peninsula ran a quarterly full-color add in the Palos Verdes Peninsula News on stormwater pollution prevention targeting source control of nutrient pollution.
- Participation in Jurisdictional Group 7 coordination meetings to work together to ensure that beach water quality on the Peninsula is protected--three of the shoreline monitoring locations on the Palos Verdes Peninsula were listed on Heal the Bay's 2011-12 Honor Roll.
- Partnership with the City of Rolling Hills Estates in staffing a stormwater quality educational booth at the local Earth Day event with the assistance of local youth
- Promotion of local household hazardous waste and electronic waste collection events.

The City's consultant also attends the monthly Executive Advisory Committee of the Los Angeles County Municipal Permittees, the quarterly Ballona Creek WMC meetings, the quarterly countywide public education coordination meetings to ensure that the City stays abreast of important storm water/NPDES issues.

The City is represented in the South Bay Cities Council of Governments and its committees, working groups, task forces and other special meetings including the Green Task Force of the South Bay COG which is an advisory group that serves as a clearinghouse for policies, programs and projects on energy efficiency, air quality, resource conservation and climate action.

Don't Drown Our Waterways in Pollution...
...Instead be the Pollution Solution!

You Can Be the Solution to Pollution

Watch how you use and dispose of different materials around your home. Fertilizers, yard clippings, automotive fluids, and animal waste can all be sources of pollution in our waterbodies. Please take care with these materials around your home, because your actions DO make a difference.

- Apply Fertilizers and Pesticides SPARINGLY and never apply these materials prior to rain!
- Make sure all leaf blowers, if used, do not blow yard clippings into the street or canyons.
- Talk to your gardener or landscaper about proper ways to dispose of yard waste and debris.
- Do not dump manure or yard waste into streets, or canyons, or on slopes; it can make GREAT composting material and can also be recycled.
- Clean up after pets and dispose of waste into a trash can, don't let them wash away.
- Collect and recycle used oil and filters when servicing your vehicle.
- Fix all oil leaks and use an absorbent material such as kitty litter to clean up spills.
- For more information on protecting our precious resources log onto: www.888CLEANLA.com

Nutrients can change the delicate balance of food and oxygen in fresh and coastal waters. An abundance of nutrients can result in algae blooms, dead zones, die offs, and change marine habitat. Nutrients are often found in fertilizers and other garden chemicals, along with animal waste, including manure.

Reduce - Reuse - Recycle

A message from the Cities of Rancho Palos Verdes, Rolling Hills Estates, Rolling Hills and Palos Verdes Estates.
Funded in part by a grant from Caltrans.

City of Rolling Hills Estates

Rolling Hills Estates WMC Summary FY2011-12

The City of Rolling Hills Estates is a small contract city of approximately 8,000 residents with a small full-time staff. The City, which is located on the Palos Verdes Peninsula in Southwest Los Angeles County, is predominantly residential, encompassing 4.2 square miles with a significant equestrian community, a central commercial district, and very little industrial zoning.

The City has a significant amount of dedicated open space including six parks, 25 miles of equestrian trails. Significant portions of the City's drainage system consist of natural, unimproved, canyons. The City has dedicated the George F Canyon Nature Center and Stein-Hale Nature Trail as a riparian preserve for public enjoyment with both passive and active education programs. We have partnered with the Palos Verdes Peninsula Land Conservancy in the preservation and restoration of coastal sage habitat and the endangered Palos Verdes Blue Butterfly at the Linden S. Chandler Preserve and at George F Canyon Nature Preserve.

The City's notable accomplishments this year with respect to NPDES programs as well as highlights of the City's ongoing program include:

The City completed installation of certified full capture devices for trash on 26 catch basins within Priority 1 areas of the City, completing the first phase of implementation under the Machado Lake Trash TMDL. These connector pipe screen devices were installed on seven (7) City-owned catch basins, and nineteen (19) County-owned catch basins.

The City in cooperation with sister cities on the Palos Verdes Peninsula this year conducted the first eleven months of monthly monitoring under the Palos Verdes Peninsula Coordinated Monitoring Plan consistent with the Machado Lake Nutrient TMDL.

The franchise solid waste hauler has converted all of its fleet used within the City of Rolling Hills Estates to CNG (compressed natural gas). This not only contributes to a reduction in greenhouse gas emissions, but also the reduction of local air deposition loading of nitrite/nitrate (NO_x) within the Machado Lake Watershed.

In July 2010 the City of Rolling Hills Estates adopted a Water Efficient Landscape ordinance and guidelines in accordance with statewide requirements. The City also has a water conservation ordinance applicable to existing and new development of all land use types. The anti-waste provisions of this ordinance not only conserve water but also reduce runoff.

City of Rolling Hills Estates

The City's residential solid waste service requires use of automated carts with hinged lids that prevent wind-blown and vector scattering of trash or green waste prior to collection. The City contracts for street sweeping at least twice per month throughout the entire city. The City has a proactive litter abatement program for keeping public rights-of-way, streets, medians, parks, and trails free of litter and debris. It also has a successful Adopt-a-Trail Cleanup and Maintenance program. The City has placed recycling bins for beverage containers in City parks with particular emphasis on parks with playing fields that are heavily utilized for youth sports programs.

The City provides curbside pickup of used oil and filters and compact fluorescent bulbs for recycling along with yard waste and other recyclables. Used oil filter collection through the City's curbside collection program increased by 73% in 2011. The City has also initiated a new program to include home-based collection of all household hazardous waste, e.g., paint, aerosol cans, and household cleaners.

City of Rolling Hills Estates

Manure collection and recycling service for horse owners is available through the City's franchise hauler. The City's solid waste ordinance prohibits improper disposal of manure and requires that manure not composted in an enclosed container must be removed completely from individual properties at least once per week. Based on manure collection rates provided by the City's solid waste franchise hauler, there has been an increase in manure diversion by 48% since instituting the current solid waste franchise agreement in 2006. Given that the horse population has remained relatively constant over the years, the City attributes the increase in manure recycling to a higher public awareness achieved through outreach, education and code enforcement.

City parks are equipped with pet waste clean-up stations and leash laws are strictly enforced.

The City of Rolling Hills Estates cooperated with other cities on the Palos Verdes Peninsula and the Machado Lake Watershed in a number of activities including:

- joint implementation of the Palos Verdes Peninsula Cities Implementation Plan and Coordinated Monitoring Plan for the Machado Lake Nutrient TMDL
- The City of Rolling Hills Estates in cooperation with the three other incorporated cities on the Palos Verdes Peninsula ran a quarterly full-color add in the Palos Verdes Peninsula News on stormwater pollution prevention targeting source control of nutrient pollution.
- participation in Jurisdictional Group 7 coordination meetings to protect beach water quality on the Peninsula--three of the shoreline monitoring locations on the Palos Verdes Peninsula were listed on Heal the Bay's 2011-12 Honor Roll.
- partnership with the City of Rolling Hills in sponsoring an Earth Day water quality booth at the local shopping mall
- joint promotion of local household hazardous waste and electronic waste collection events
- issuing a joint ad with the City of Rancho Palos Verdes promoting used oil and filter recycling in the local auto show program magazine

The City's representative attends the monthly Executive Advisory Committee of the Los

Annual Assessment 2011-12

City of Rolling Hills Estates

Angeles County Municipal Permittees, the quarterly Santa Monica Bay-Ballona Creek WMC meetings, and the quarterly countywide public education coordination meetings, to ensure that the City stays abreast of important storm water/NPDES issues. The City is also an active participant in the South Bay Cities Council of Governments and its committees, working groups, task forces and other special meetings. The City participates in the Green Task Force of the South Bay COG which is an advisory group that serves as a clearinghouse for policies, programs and projects on energy efficiency, air quality, resource conservation and climate action.

City of Santa Monica

City of Santa Monica Watershed Accomplishments FY11-12

The City has a goal of providing BMP treatment systems for all dry weather runoff and up to 80% of wet weather runoff leaving its borders whether to the Ballona Creek or Santa Monica Bay watersheds. Aided by a 1995 stormwater parcel fee and a 2006 Clean Oceans special tax, the City is well on its way to meeting its goal. Through its watershed management plan, passed in the summer 2006, the City is doing an excellent job in meeting the requirements in the NPDES permit. The City also continues to require the installation of post-construction structural BMPs for all land uses, both private and public, not just merely for the categories of the SUSMP.

2011-12 Highlights:

- Continued dedication of the City Council, managers and staff who believe in the City's sustainable policies in protecting our coastal waters. Existing laws and programs have allowed the City to build a very solid foundation in the ongoing effort to maintain clean waterways and beaches.
- Ongoing maintenance of about 650 city catch basins-storm drains, both with and without screens (some retractable)/filtering inserts, as well as other larger off-line centralized BMPs, such as screening-separation vortex and non-vortex proprietary systems.
- Ongoing design of a comprehensive trash removal strategy in the Kenter Canyon sub-watershed to meet the Santa Monica Bay Marine Debris TMDL.
- Ongoing implementation of the City's urban runoff pollution mitigation ordinance, SMMC 7.10, which promotes Low Impact Development solutions in lieu of treat and release systems.
- Implementation of the City's second year of its 5-year CIP Low Impact Development Plan, which enumerates 10 categories of watershed projects to be constructed with Clean Beaches funding, which included five permeable alleys. Development of designs for a parkway high efficiency bio-filtration pilot project.
- 11th year of successful SMURRF operations and tours.
- Installation of 133 new BMPs around the City (public and private).
- Beginning of two grant-funded projects: WaterSMART to help fund Master Sustainable

City of Santa Monica

Water Plan 2020; Proposition 84, In-Line Runoff Harvesting and Infiltration Project

- Commencement of installation of the City's 3rd green street, Ocean Park Blvd.
- Commencement of construction of new Civic park and botanical garden, which include three vertical infiltration structures for runoff harvesting.
- Approval by LA County Public Health of the Southern California rainwater-stormwater-runoff harvesting regulatory policy matrix.
- Completion of design of a new library that will include a 13,000 gallon cistern for indoor flushing, first such project in the City.

In an attempt to enhance the effectiveness of its program, the City works on a monthly basis with its watershed councils, the county, and City of LA on partnerships and efforts to reduce runoff pollution.

Weekly enforcement patrols help enforce city regulations to reduce urban runoff and pollution, as well as educate the public about watershed issues and solutions.

Efforts continue to design and implement projects for the Implementation Plan of the Bacterial Wet Weather TMDL for Santa Monica Bay Beaches.

Neal Shapiro, 8/29/12

The Ballona Creek Watershed Management Committee
Annual Assessment 2011-12

City of West Hollywood

City of West Hollywood
Ballona Creek
Watershed Management Committee
Watershed Summary
FY 2011/12

Compliance with Permit Requirements:

The City has continued to implement all areas of the permit, targeted pollutants of concern and took additional steps to prevent spills and discharges.

The City's pollutants of concern – bacteria from pet waste, cigarettes from pedestrians, restaurants and bars & toxics and metals from parking lots and streets – continue to be addressed by a variety of methods including daily street sweeping, daily hand pick-up of litter, pet waste stations, steam cleaning of sidewalks and alleys, mandatory cigarette disposal receptacles at outdoor dining areas and aggressive code enforcement of excess trash and other NPDES related discharges. The City maintains 81 pet waste stations. The sewer inspection and maintenance project, budgeted at \$700,000 per year, is ongoing.

In 2007, West Hollywood's City Council formed an Environmental Task Force for input about water conservation, urban runoff and other environmental issues. The group presented its recommendations, which addressed: permeable surfaces, composting, a ban on plastic bags, enforcement of the polystyrene ordinance, waste reduction and urban runoff.

The City Council approved the mandatory Green Building Program for all commercial and residential projects greater than three units in 2007. The program requires compliance in areas of irrigation, water use and water efficient landscape. The ordinance also addresses: use of low emitting adhesives, sealants, paints and coatings, use of low emitting materials, composite wood and agrifiber products, indoor chemical and pollutant source control, recycled content, formaldehyde free insulation, use of composite wood without urea formaldehyde; no-VOC paints on exterior applications and other practices.

Evaluation Methods Used to Determine Program Effectiveness:

One of the most important measures are the monitoring reports for pollutants of concern in Ballona Creek. The City receives monthly reports for bacteria levels. The City continues to meet every other month with other cities within the Ballona Creek Watershed, to implement

The Ballona Creek Watershed Management Committee
Annual Assessment 2011-12

City of West Hollywood

the Bacteria, Toxics and Metals TMDL's Monitoring & Implementation Plans. City staff attends LA County's quarterly NPDES Public Outreach meetings and any Ballona Creek Watershed meetings, as well. The reports help determine what additional BMPs should be installed and where.

Locally, a major indicator of the stormwater program effectiveness is the number of citations issued by the City's Code Compliance Divisions. This year, 15 stormwater related citations were issued, with one additional NPDES complaint addressed with a verbal warning, given by the City's NPDES Consultant, John L. Hunter & Associates. All complaints were resolved. The City's approach of educating and working together with business owners/managers and residents helps create awareness and facilitates active participation in helping reduce activities that contribute to stormwater pollution.

Summary of Program Strengths and Weaknesses:

At 1.9 sq miles, the City of West Hollywood can be monitored for illegal discharges fairly easily. The Code Compliance Divisions are aggressive about enforcement. Other City Divisions, such as Street Maintenance, are also well trained to spot problem areas at businesses and construction sites. Constituents are well informed about urban runoff and report problems readily. Neighborhood Watch groups assist in getting the word out about bacteria from pet waste and identify where additional pet waste stations should be installed. Volunteers from these groups, as well as Sheriff's volunteers and Code Compliance Officers distribute biodegradable plastic pet waste bags to dog walkers, as these opportunities arise.

Weaknesses include a steady turnover of restaurant, bar and hotel management/staff, which necessitates continual retraining and monitoring of these businesses. This challenge is not unique to West Hollywood, but can be seen countywide.

Highlights and Accomplishments:

1. To address bacteria, more pet waste stations have been - added for a current total of 81.
2. Aggressive Code Compliance efforts and educational outreach to restaurants, hotels and residents.
3. Mandatory green building ordinance in place, with toxics reduction and urban runoff measures spelled out.
4. Alternatives to styrofoam/polystyrene on City's website.
5. Plastic bag ban sent to Council; ordinance to be crafted. (Pending)
6. Resolution in support of SB 568(LOWENTHAL) Recycling: Polystyrene Food

The Ballona Creek Watershed Management Committee
Annual Assessment 2011-12

City of West Hollywood

Containers.

Water Quality Improvements or Degradation in the Watershed:

No significant improvement or degradation noted.

Interagency Cooperation:

The City works closely with many agencies to mitigate urban runoff. One of the most effective partnerships is with the cities of Culver City and Beverly Hills. These three cities collaborate on a Used Oil Recycling Grant and work together as “Westside Cities” to strategically use the funds to protect Ballona Creek.

The City continues to meet every other month with other cities within the Ballona Creek Watershed, to implement the Bacteria, Toxics and Metals TMDL’s Monitoring & Implementation Plans. City staff attends LA County’s quarterly NPDES Public Outreach meetings and any Ballona Creek Watershed meetings, as well.

Future Plans to Improve West Hollywood’s Program:

The City continues its work on an ordinance to ban plastic bags. The outreach to businesses is being coordinated with the City’s Economic Development Division and West Hollywood Chamber of Commerce. Since the ban is closely tied to urban runoff and protection of marine life, the outreach will integrate other aspects of pollution prevention including promotion of alternatives to polystyrene.

We expect the new upcoming NPDES permit and the City’s own General Plan updates to further strengthen pollution prevention efforts.

Suggestions to Improve Effectiveness of the City’s Program or LA County’s Model Programs:

Public Outreach materials from LA County, available in Russian, as the City of West Hollywood has a large Russian community - who benefits greatly when information is available in a bilingual format.

IV. Identification of Effective/Ineffective BMPs:

Ballona Creek Watershed permittees continue to implement BMPs as required by the SQMP. While no independent analysis of the effectiveness of individual BMPs has been conducted by the WMC, BMPs that are considered to be effective include:

- ❖ Street sweeping;
- ❖ Catch basin cleaning;
- ❖ Catch basin inserts and end-of pipe controls;
- ❖ Infiltration controls;
- ❖ Erosion controls; and
- ❖ Public education and outreach

In addition to the Countywide SQMP the Santa Monica Bay Watershed Permittees are implementing additional BMPs through Implementation Plans developed and coordinated by the Jurisdictional Groups for the Santa Monica Bay Beaches Bacteria TMDL. By proper design, regulation, and proper implementation of BMPs, the impact of urbanization and pollution on local watersheds can be considerably reduced to continue to improve water quality.

NOTE: Individual City comments were submitted by the cities and were not reviewed or modified for content by the Watershed Management Committee.

ATTACHMENT I-1

2005 STORMWATER UTILITY SURVEY

BLACK & VEATCH
building a **world** of difference™

ENERGY WATER INFORMATION GOVERNMENT

Black & Veatch is pleased to provide the results of its sixth national Stormwater Utility Survey, to help those involved in the stormwater industry stay well-informed across a range of issues. The survey results offer insight into the following topics:

- Organization/Administration
- Planning
- Operations
- Finance/Accounting
- Stormwater User Fees and Billing
- Quality Issues – Best Management Practices
- Public Information/Education
- Major Challenges Recently Faced
- Significant Events Affecting Utilities

These results can be used for numerous purposes, from performance management to financial planning to organization strengthening. At Black & Veatch, we understand the value of knowing what others are doing in the industry. For 90 years, meeting the needs of the utility industry has been at the core of our business. We are happy to discuss any questions you might have regarding this survey.

Profile of Respondents

- Responses were received from 99 utilities in 21 states and one Canadian province. All of these utilities are funded in whole or in part through user fees.
- Approximately 86 percent of the respondents serve a city, rather than a county or region.
- The population served by the respondents ranges from 1,400 (Atlantic Beach, FL) to 3.9 million people (Los Angeles, CA) and the area served varies from 3 to 1,500 square miles. Eighty-one percent indicate they are responsible for stormwater facilities only, while the balance report they are responsible for combined sanitary/stormwater facilities. Approximately 88 percent indicate that they use their own staff to provide a majority of operation and maintenance services.
- For those utilities that base charges on gross property area, equivalent residential units ranged from 1,600 square feet total area to 11,000 square feet, with a mean of 6,964 square feet. For those utilities that base charges on impervious area, impervious areas per equivalent residential unit ranged from 1,500 square feet to 10,000 square feet, with a mean of 2,647 square feet.

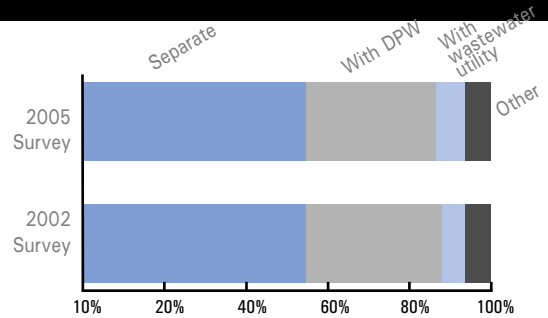

What's New

Feedback from participants prompted us to add a new question to the 2004-2005 version of the Stormwater Utility Survey. In recent years, a number of stormwater treatment systems have become commercially available. Fifty-six percent of respondents have installed at least one of these devices with the most popular being Stormceptor, StormFilter, and CDS Separator. Thirty-six percent have had a favorable experience with these devices in terms of treatment efficiency and ease of maintenance, while 41 percent are still in the evaluation process.

Organization / Administration

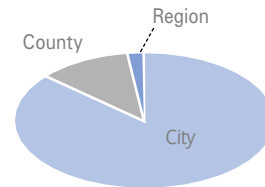

Q How is your operation organized?

- 55% Separate utility
- 32% Combined with Department of Public Works
- 7% Combined with wastewater utility
- 6% Other

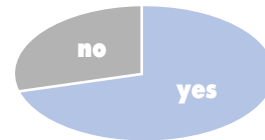

Q What area does your utility serve?

- 86% Within city limits
- 12% County
- 2% Region

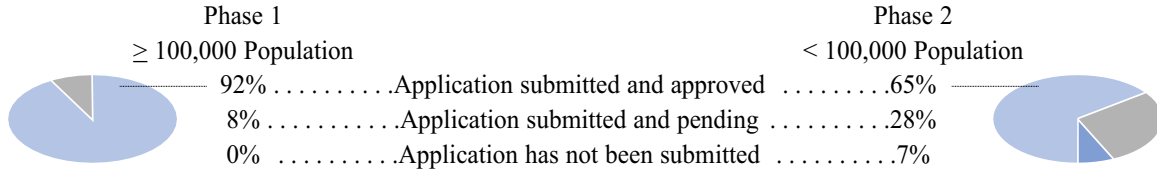

Q Does your state have specific statutes that govern the formation of stormwater utility and user fee financing?

- 71% Yes
- 29% No

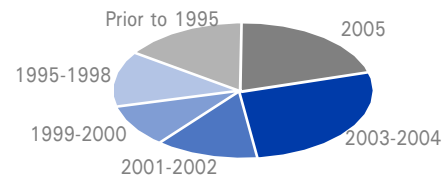

Planning

Q What is the status of your NPDES permit?

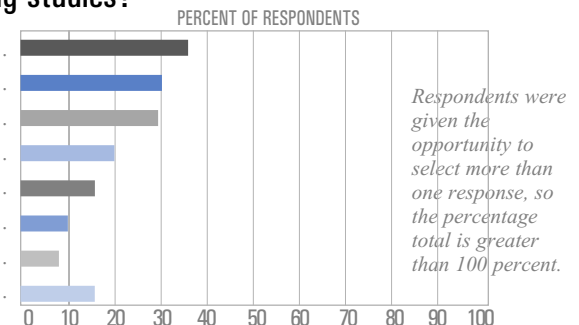

Q When was your most recent stormwater plan or stormwater facilities plan?

- 21% 2005
- 27% 2003–2004
- 13% 2001–2002
- 10% 1999–2000
- 13% 1995–1998
- 16% Prior to 1995

Q What stormwater computer models do you use for planning studies?

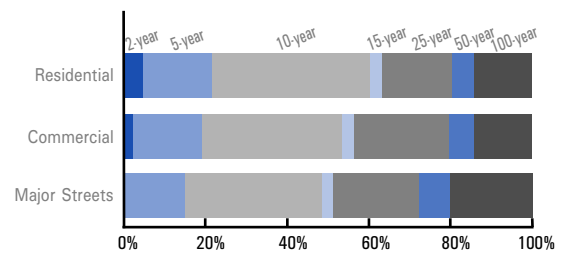

- 36% HEC-2
- 30% XP-SWMM
- 29% HEC-1
- 20% TR-55
- 16% EPA SWMM
- 10% HEC-RAS
- 7% HEC-HMS
- 15% Other

Planning (continued)

Q What return periods do you use to design your major stormwater structures?

	Residential	Commercial	Major Streets
2-year	3%	1%	0%
5-year	18%	17%	14%
10-year	39%	35%	34%
15-year	3%	3%	3%
25-year	17%	23%	21%
50-year	6%	7%	8%
100-year	14%	14%	20%

Several respondents provided a range of return period. The percentages above represent the smallest return period provided.

Q Which performance indicators do you consider most important in measuring improvement in stormwater management success?

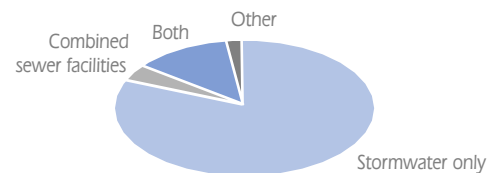

47%	Flood control
31%	Monitoring pollutants
17%	Customer complaints/satisfaction
11%	Cost control measures
6%	Erosion control
6%	Maintenance
5%	Habitat

Operations

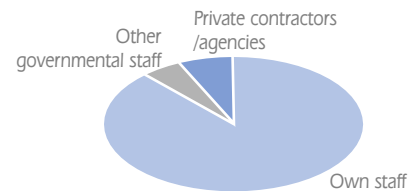

Q What is your utility responsible for?

81%	Stormwater facilities only
4%	Combined sewer (sanitary/stormwater) facilities
13%	Both
2%	Other

Q Who provides the majority of your O&M services?

88%	Own Staff
5%	Other Governmental Staff
7%	Private contractors/agencies

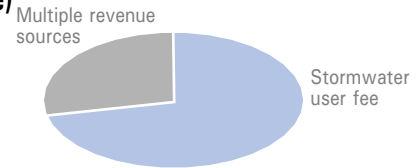

Finance/Accounting

Q What are your major (at least 90 percent of total income) revenue sources?

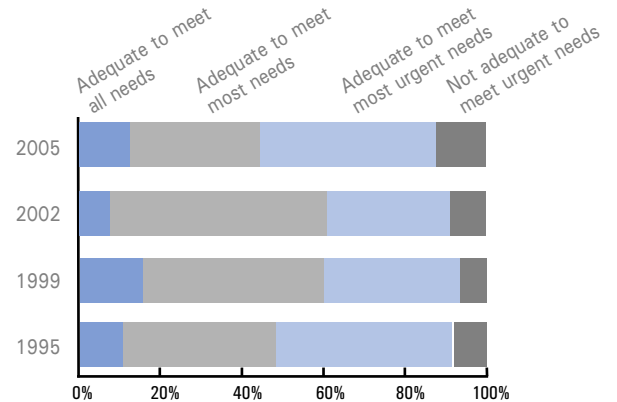

(Excludes 7 utilities that reported no single major source)

- 72% Stormwater user fee
- 28% Multiple revenue sources

Q How adequate is available funding?

- 13% Adequate to meet all needs
2002 = 8% • 1999 = 16% • 1995 = 11%
- 32% Adequate to meet all needs
2002 = 53% • 1999 = 44% • 1995 = 38%
- 43% Adequate to meet most urgent needs
2002 = 30% • 1999 = 34% • 1995 = 44%
- 12% Not adequate to meet urgent needs
2002 = 9% • 1999 = 6% • 1995 = 7%

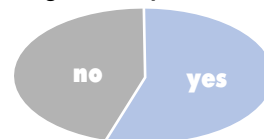

Q How is the majority of capital improvement needs financed?

- 74% Cash financed
 - 65% From user fees
 - 0% From ad valorem taxes
 - 9% Other
- 26% Debt financed
 - 14% Stormwater revenue bonds
 - 9% General obligation bonds
 - 0% Combined bonds
 - 3% Other

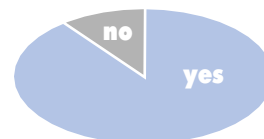

Q Does your accounting system permit cost tracking by operating activity (e.g., inlet cleaning)?

- 55% Yes
- 45% No

Q Does your accounting system identify user fee revenues by customer class (e.g., residential)?

- 89% Yes
- 11% No

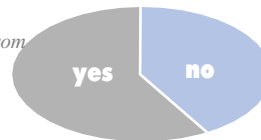

Stormwater User Fees and Billing

Q Were your rates revised in the last 12 months?

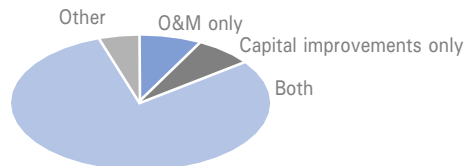

- 41% No
- 59% Yes

Increases ranged from 1% minimum to 117% maximum

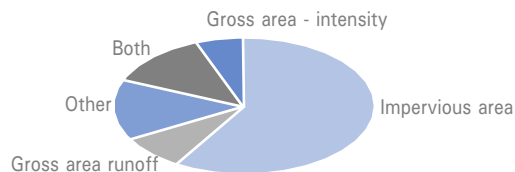

Q What are your user fees designed to pay for?

- 8% Operation and maintenance (O&M) expenses only
- 7% Capital improvements only
- 80% Both O&M expenses and capital improvements
- 5% Other

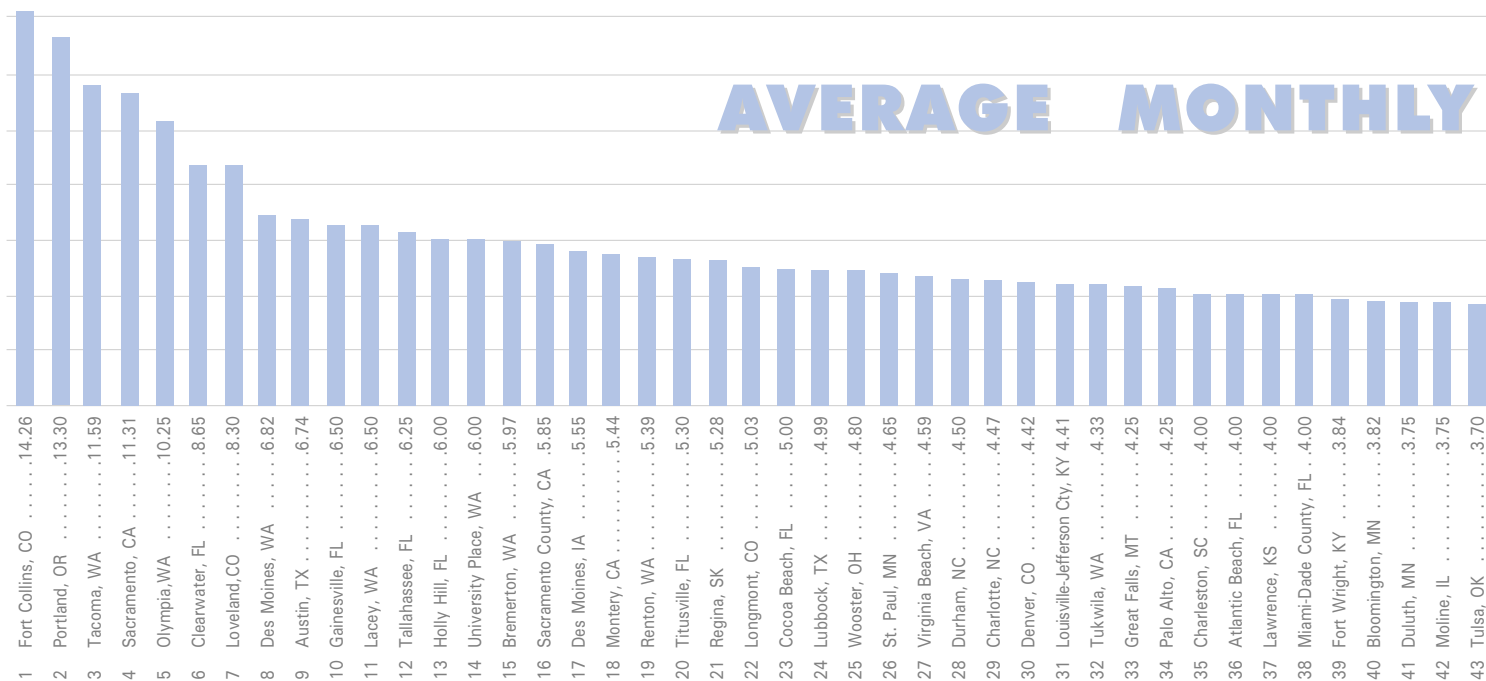

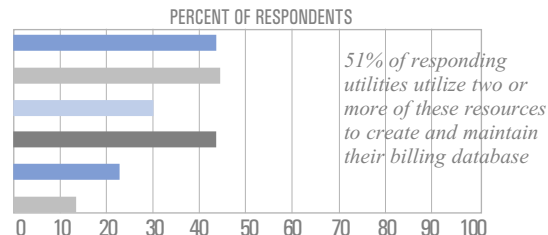

Q What is the basis for your user fees?

- 59% Impervious area
- 8% Gross area with intensity of development factor
- 14% Both impervious and gross areas
- 13% Other (e.g., number of rooms, water use, flat fee)
- 6% Gross area with runoff factor

Q If user fees are area-based, what principal resources were employed to create and maintain the customer database used to compute charges?

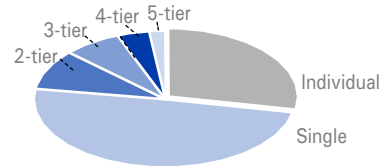

- 42% Property tax assessor records
- 43% Aerial photographs
- 29% On-site property measurement
- 42% Geographic Information System (GIS)
- 22% Planimetric map take-offs
- 13% Other (e.g., building permits, site plans)

Q Are your stormwater charges based on individual or class average characteristics?

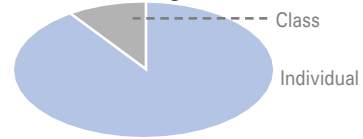

Residential

- 27% Individual parcel
- 73% Class average as:
 - 48% Single tier
 - 9% 2-Tier rate
 - 7% 3-Tier rate
 - 4% 4-Tier rate
 - 2% 5-Tier rate

Non-Residential

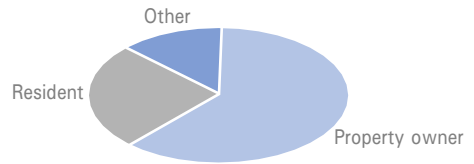

- 90% Individual parcel
- 10% Class average

3% of respondents who answered class average did not provide the number of rate tiers.

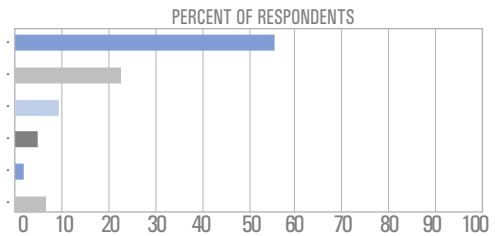

Q Who is responsible for the payment of user fees?

- 62% Property owner
- 25% Resident
- 13% Other (e.g., water or other utility bill recipient)

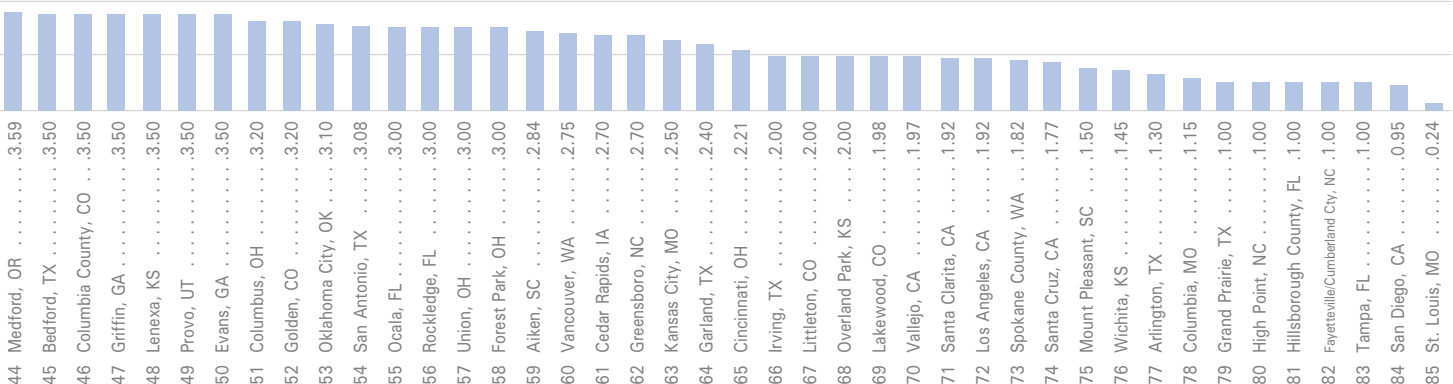

Q How frequently do you bill?

- 56% Monthly
- 22% Annually
- 9% Bi-monthly
- 5% Quarterly
- 2% Semi-annually
- 6% Other

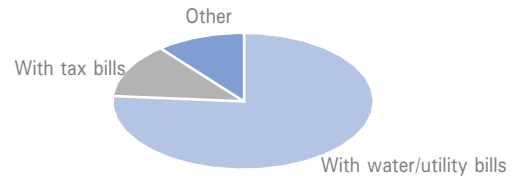

RESIDENTIAL CHARGE

Stormwater User Fees and Billing (continued)

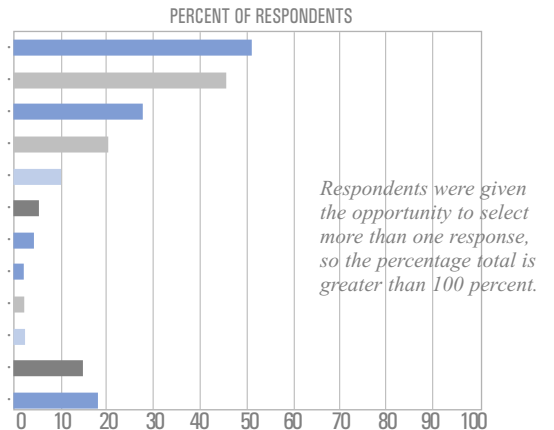

Q How are your user fees billed?

- 76% With water or other utility bills
- 13% With tax bills
- 11% Other

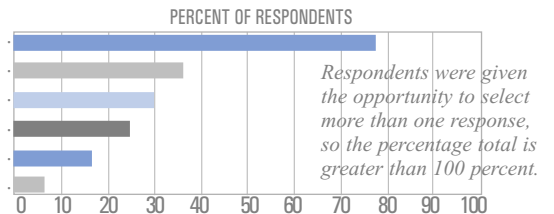

Q What types of properties are exempt from user fees?

- 51% Streets/highways
- 46% Undeveloped land
- 27% Rail rights-of-way
- 20% Public parks
- 10% Government
- 5% School districts
- 4% Churches
- 2% Airports
- 2% Colleges/universities
- 2% Water front
- 14% None
- 17% Other

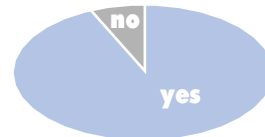

Q What customer classifications are recognized in your stormwater fee structure?

- 77% Residential
- 36% Commercial
- 30% Combined commercial/industrial
- 25% Other
- 17% Industrial
- 7% No designation

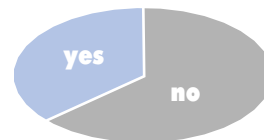

Q Are rates the same for all service areas or watersheds?

- 93% Yes
- 7% No

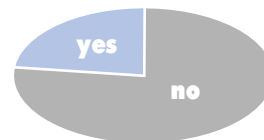

Q Are your user fees for single family dwellings the same as for individual multiple residential units, such as apartments and condominiums?

- 64% No
- 36% Yes

Q Are one-time impact/capital recovery fees applied to new stormwater utility customers or new development?

- 77% No
- 23% Yes

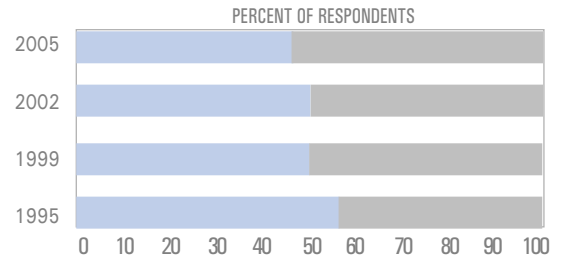

2004–2005 Stormwater Utility Survey

Q Are credits provided for private detention/retention facilities?

46% Yes
 2002 = 53% • 1999 = 50% • 1995 = 57%

54% No

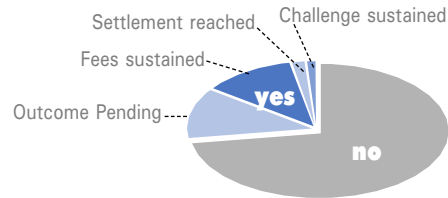

Q Have your user fees faced a legal challenge?

72% No

28% Yes

- 12% Outcome pending
- 12% Fees sustained
- 2% Settlement reached
- 1% Challenge sustained (2 later remedied by legislation)

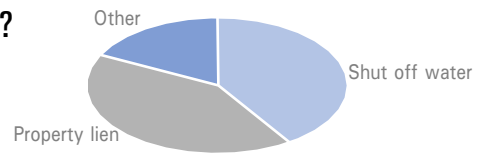

Q On what basis is payment of your user fees enforced?

41% Lien on property

42% Shut off water

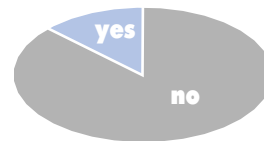

18% Other

Q Is a significant share of your utility costs attributable to stormwater from outside your service area?

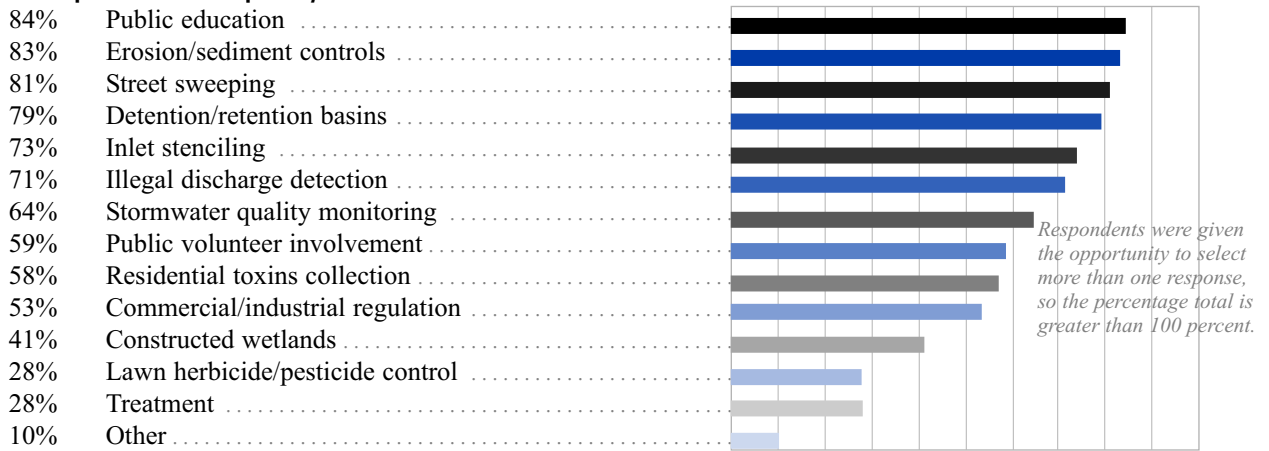

87% No

13% Yes

Quality Issues – Best Management Practices

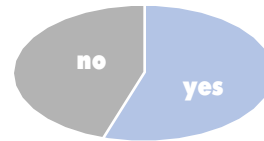

Q Which programs and practices are being used to protect or improve water quality?

Quality Issues Best Management Practice (continued)

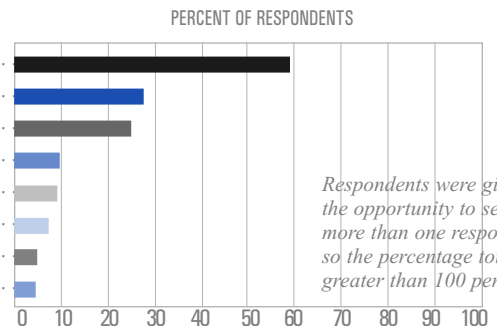

Q Have you installed any stormwater treatment systems in your stormwater conveyance system?

55% Yes
45% No

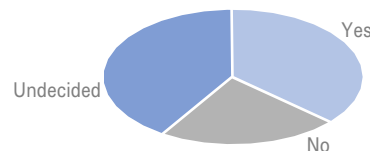

Devices installed:

59% Stormceptor
28% CDS Separator
24% StormFilter
9% Downstream Defend
9% Vortechincs
7% Bay Saver
4% Abtech
4% SunTree Technologies

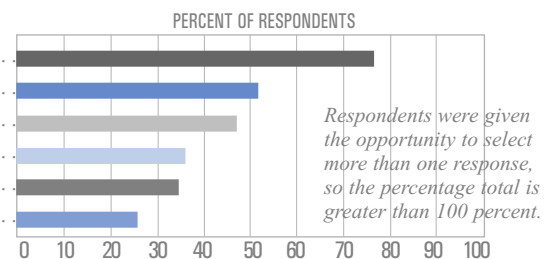

Have these devices met your expectations?

36% Yes
23% No
41% Undecided

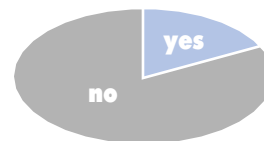

Q What contaminants are your greatest concern?

76% Sediments
51% Nutrients
47% Oil and grease
35% Heavy metals
34% Pesticides
25% Other

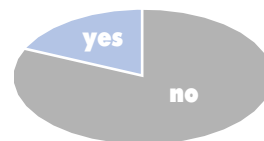

Q Are quality-based user fee credits or other incentives provided to encourage customers to control or reduce stormwater pollution?

18% Yes
82% No

Q Are your user fees specifically designed to provide for the separate recognition and equitable recovery of costs associated with stormwater quality management and quantity(runoff) management, respectively?

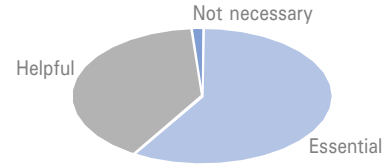

81% No
19% Yes

Public Information/Education

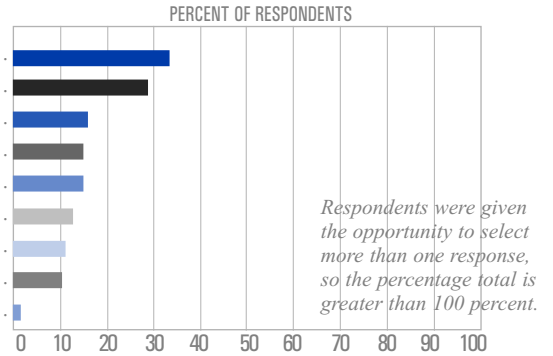

Q How important is an organized public information/education effort to the continuing success of a user fee funded stormwater utility?

- 59% Essential
- 40% Helpful
- 1% Not necessary

Q What means have you found to be the most effective in educating the public about utility services, program needs and financing, and citizen responsibilities?

- 33% Bill inserts
- 29% Public hearings/presentations
- 16% Internet
- 15% Brochures/flyers/newsletters
- 15% Newspaper
- 12% Television
- 11% Public schools
- 10% Speakers bureau
- 1% Direct mail

Major Challenges Recently Faced

Financial, rate, and billing related issues (e.g., financing growth, capital replacements, NPDES and other environmental mandates; rate increases, rate equitability, rate challenges; and billing database updating or conversion to GIS)	19 utilities
Weather and flooding issues (e.g., high amounts of rainfall, standing water, West Nile concerns, localized flooding)	10 utilities
Erosion control (e.g., run-off, erosion problems)	8 utilities
Regulatory and quality control compliance (e.g., illicit discharges, quality monitoring, and difficulties of complying with more stringent state and federal quality mandates related to Endangered Species Act, TMDLs, et al.)	8 utilities
Infrastructure planning issues (e.g., need for integrated flood, quality and environmental planning; remedy of specific infiltration/inflow or local flooding problems; and system-wide flood control master planning)	7 utilities
Jurisdictional issues (e.g., incorporation of added cities into service area and co-permittee coordination)	3 utilities
Public education (e.g., need for increased education regarding new programs or rate increases)	2 utilities

Significant Events Affecting Utilities in Past Two Years

NPDES compliance	21 utilities
CIP related (funding, projects started/completed)	14 utilities
User fee related (increases, lack of increases)	14 utilities
Weather related (heavy rains, storms, drought)	8 utilities
Organization/administration/staffing changes	7 utilities
Public education/awareness	4 utilities
Urban growth/decline in service area	4 utilities
Legal challenges	2 utilities

Some respondents listed the same events as positive, negative, or both (e.g., heavy rains or flooding brought both damage and increased public awareness of needs).

Stormwater Management

From run-off to potential revenue stream, stormwater management is uniquely challenging. It is often not source-specific, not metered or monitored closely within the community, and not tied to customers' daily decisions.

Black & Veatch's Enterprise Management Solutions team assists utilities nationwide in stormwater management issues to help provide stable funding for operations as well as capital projects.

ABOUT ENTERPRISE MANAGEMENT SOLUTIONS

Black & Veatch is pleased to provide this survey as an industry service. For 90 years, meeting the needs of utilities nationwide has been at the core of our business. We understand the value of knowing how others are addressing the industry's complex issues. From organization effectiveness to financial structuring to risk management, it helps to know the industry's trusted business partner. Black & Veatch brings it all together.

ATTACHMENT I-2

City of San Clemente Clean Ocean Program & Fee **Frequently Asked Questions**

What is the Clean Ocean Program?

It is the City's effort to prevent stormwater and urban runoff pollution from entering the storm drain system and being discharged at the beach.

Why does the City need a Clean Ocean Program?

- To protect the environment (water quality in local channels and coastal waters);
- To protect public health and safety (from bacteria and other pollution that could reach the beach);
- To protect local quality of life (local business/tourism, "beach town" reputation, etc.); and
- To meet State Water Code and Federal Clean Water Act permit requirements issued to South Orange County cities by the State.

Who developed the Clean Ocean Program?

The City prepared an Urban Runoff Management Plan (URMP), which included participation and feedback from the community as well as the City's Coastal Advisory Committee (local citizens appointed by the City Council to consider and provide advice on coastal and water quality issues). The URMP guides the Clean Ocean Program, and outlines activities and projects to meet the State and Federal water quality requirements and protect local water quality.

What does the Clean Ocean Program include?

- *Runoff treatment projects*
 - Poche Beach: A treatment system was constructed and is maintained to filter and kill bacteria in the runoff before it reaches the beach. Construction was completed in March of 2009. The system treats up to 1.1 million gallons per day. Weekly water quality tests indicate that the UV treatment removes between 95% - 99% of the bacteria in the storm drain runoff before it discharges to the beach. The current water quality grade at Poche Beach is an A+.
 - North Beach: A system was constructed to divert dry weather runoff away from North Beach and send it to the City's Water Reclamation Plant for treatment. The system started operating on June 1, 2009. It diverts and filters about 350,000 gallons per day. The current water quality grade at North Beach is an A+.
 - Underground storm drain units were installed to remove trash, oil & grease and sediment from runoff before it gets to the beach. Six units have been installed. They are located near Calafia Beach, in the Pier Bowl area, at the west ends of El Portal, at the end of Linda Lane and at Mariposa. In 2013, 35 cubic yards of material was captured and removed by these units. This is material that would have otherwise have ended up in the ocean.
- *Pollution prevention activities*
 - Street Sweeping: the City sweeps public residential streets twice per month and major streets and business areas about 3 times per week. Over 22,000 tons of material has been collected over the last ten several years, enough to fill 550 large (40 cubic yard) trash bins.
 - Catch Basin Inspection and Cleaning: the City inspects at least 2,205 catch basins annually, cleaning them as needed. In 2013, 2,432 catch basins were cleaned and a total of 914 cubic feet of material was removed.
 - Water Quality Testing: water samples from over 20 locations throughout town are sampled each year to help identify potential problem areas and monitor quality progress over time. Flow measurements are also taken to help measure progress in reducing urban runoff flows.
 - Special Studies: the City consulted with scientists to conduct an in depth investigation to find sources of bacteria in the Poche Beach watershed. A year long study which included molecular

City of San Clemente Clean Ocean Program & Fee **Frequently Asked Questions**

marker testing culminated in focused recommendations and a strategic plan for reducing bacteria at Poche Beach. The final report of the study is located on the Clean Ocean Program website at www.sccleanocean.org.

- **Commercial, Industrial and Construction Site Inspections:** Inspections of businesses, industrial facilities and construction sites are conducted to make sure these sites are using proper Best Management Practices (BMPs) to prevent pollution from entering the storm drain system and reaching the beach. Over 9,000 inspections have been completed in the last 10 years.
- **Spill Cleanups and Storm Drain Maintenance:** A 24/7 hotline number (**366-1553**) is in place to respond to and cleanup spills or investigate reported illegal discharges. In addition, the City performs ongoing maintenance to ensure proper function of the storm drain system and inspects all public catch basins annually and removes materials that might be discharge into the system.
- **Enforcement of Anti-pollution Ordinances:** Dedicated officials enforce water quality laws to identify and correct violations. Depending on the severity of the violation, enforcement may include verbal warnings, written correction orders, and/or fines of \$100, \$200, or \$500 per violation.
- **Public Outreach and Education:** Efforts promote awareness of stormwater and urban runoff pollution impacts, and ways the public can help prevent this pollution from happening in the first place.

What is the cost of implementing the Clean Ocean Program?

The cost to implement the program is about \$2.2 million per year.

What is the cost of not implementing the Clean Ocean Program?

The City could be liable for large fines if the State finds that the City is not meeting the requirements of the stormwater permit regulations. Also, there are potential economic impacts (tourism, real estate values, etc.) if the City does not work to protect its healthy beach town reputation.

How is the Clean Ocean Program funded?

By a Clean Ocean utility fee charged to property owners. The fee is collected as a line item on the monthly utility bill for owners that get water service from the City. The fee is charged monthly but collected via a separate twice-yearly bill to San Clemente property owners that get water service from other providers (e.g. South Coast Water District or Santa Margarita Water District).

Why do property owners get charged the Clean Ocean Fee?

Developed and graded properties contribute runoff to the storm drain system (which includes pipes, channels, drain inlets and street gutters). This runoff contains or picks up pollution before it enters the storm drain, which the City must then address. Since providing storm drain and water quality services is like other utility services provided by the City (e.g. drinking water and sewer service), it is appropriate that property owners pay for the cost of this service.

How long will the continued fee be in effect? When will it end?

If approved by San Clemente property owners, the existing Clean Ocean Fee would be continued for an additional six and one-half (6.5) years, and would expire on June 30, 2020.

How much will the fee increase over the next 6.5 years?

The continued Clean Ocean Fee would be fixed and would not increase over the entire period.

Why are property owners voting on this fee?

**City of San Clemente Clean Ocean Program & Fee
Frequently Asked Questions**

Under the provisions of California Proposition 218, property owners must approve new property fees adopted by cities.

What is the change from the existing to the proposed Clean Ocean Fee?

Single Family Residential Monthly Fee		
	Current Fee	Proposed New Fee
Private street	\$ 4.39	\$ 5.10
Public street	\$ 5.02	\$ 6.23

Multi-Family Residential Monthly Fee		
	Current Fee (per residential unit)	Proposed New Fee (per residential unit)
Private street	\$3.51	\$4.08
Public street	\$4.01	\$4.98

Non-Residential (Commercial, Industrial, Business Park) Monthly Fee		
	Current Fee (per acre or fraction thereof)	Proposed New Fee (per acre or fraction thereof)
Private street	\$43.90	\$51.00
Public street	\$50.20	\$62.30
Note: Almost all non-residential streets within the City are public streets.		

Undeveloped, Graded Property Monthly Fee				
	Current Fee		Proposed New Fee	
	<i>2 acres or less</i>	<i>Each acre over 2 add:</i>	<i>2 acres or less</i>	<i>Each acre over 2 add:</i>
Private street	\$2.20	\$0.44	\$2.55	\$0.51
Public street	\$2.51	\$0.50	\$3.12	\$0.62
Note: There is no clean ocean fee charge for undeveloped, ungraded parcels.				

Note: Properties on private streets are charged a lower rate since the City doesn't provide street sweeping service on private streets.

How is the fee calculated?

The fee is based on a parcel's expected contribution of runoff, which is determined by an estimate of the impervious area on that parcel. Impervious areas include such things as buildings and pavement, which prevent or restrict storm water from getting into the soil and increase runoff from a parcel.

Why is the existing Clean Ocean Fee being proposed to be continued?

The fee funds a stormwater quality program that the State requires the City to implement. Since the fee was last approved, the State revised and adopted a new stormwater permit for the south Orange County area that contains more rigorous requirements. Also, the State recently adopted new requirements for bacteria pollution for which the City must comply.

What happens if continuation of the existing Clean Ocean Fee is not approved?

If the Clean Ocean Fee is not continued, the City will need to support the Clean Ocean Program with some other funding source. The most likely source would be the General Fund, which would result in about \$2 million each year that would not be available for other needed projects and programs within the City.

**City of San Clemente Clean Ocean Program & Fee
Frequently Asked Questions**

How and when will the vote occur?

All record owners of property within the City that are directly subject to the proposed fee will receive an official mail-in ballot with a postage paid addressed return envelope. The ballots will be mailed to property owners on October 25, 2013. Return ballots are due on December 10, 2013.

How do I cast my vote?

Simply fill out the ballot and mail or deliver it to the San Clemente City Clerk by the due date noted on the ballot.

How do I get more information?

More information about the proposed fee continuation is available on the City's website at www.sccleanocean.org. You may also call the Environmental Programs Section at (949) 361-8204 or send an email to cleanwater@san-clemente.org.

What's the difference between storm drains and sewers – doesn't it all get treated?

Like most other cities, the City of San Clemente owns and operates a storm drain system, which is the network of channels and pipes that collect stormwater and urban runoff and discharges it into the ocean. Unlike sewer systems that send sewage to a treatment plant before being discharged, most storm drain systems, including the City's, were built to collect and convey runoff to prevent flooding but not to treat urban water runoff. Therefore, any pollutants that runoff carries into the storm drain system are discharged untreated along the City's shoreline.

Do other cities have a Clean Ocean Program?

They may call it something else, but all cities in the urbanized areas of Southern California are required by the State to implement stormwater and urban runoff programs to prevent discharges of pollution to creeks, rivers and the ocean.

How do we know that the Clean Ocean Program is working?

- The City records amounts of trash picked up by street sweepers and removed from underground treatment devices.
- Larger treatment projects include monitoring to compare water quality before and after treatment.
- The City tracks the number of enforcement actions and inspections to document these efforts.

Why should San Clemente property owners pay to clean up pollution from upstream cities?

Unlike most cities in Southern California, San Clemente's city boundary is very similar to the local watershed boundary. This means that San Clemente is a self-contained watershed, and that there are no upstream cities that contribute pollution through our local watershed. So the pollution in our storm drains comes from San Clemente properties, and not from out-of-town areas.

How can I help?

To learn about simple tips to help prevent urban runoff pollution, please visit www.sccleanocean.org or www.ocwatersheds.com.

To learn about potential volunteer opportunities (e.g. beach cleanups), please visit www.scwatersheds.com.

City Storm Water Program and Measure E: Clean River, Beaches and Ocean Fund

FY 2015 Highlights

Dedicated funding for programs
to prevent pollution from reaching our waterways
and beaches

Urban Runoff

Rain and urban runoff flows untreated directly into local streams, the San Lorenzo River and Monterey Bay

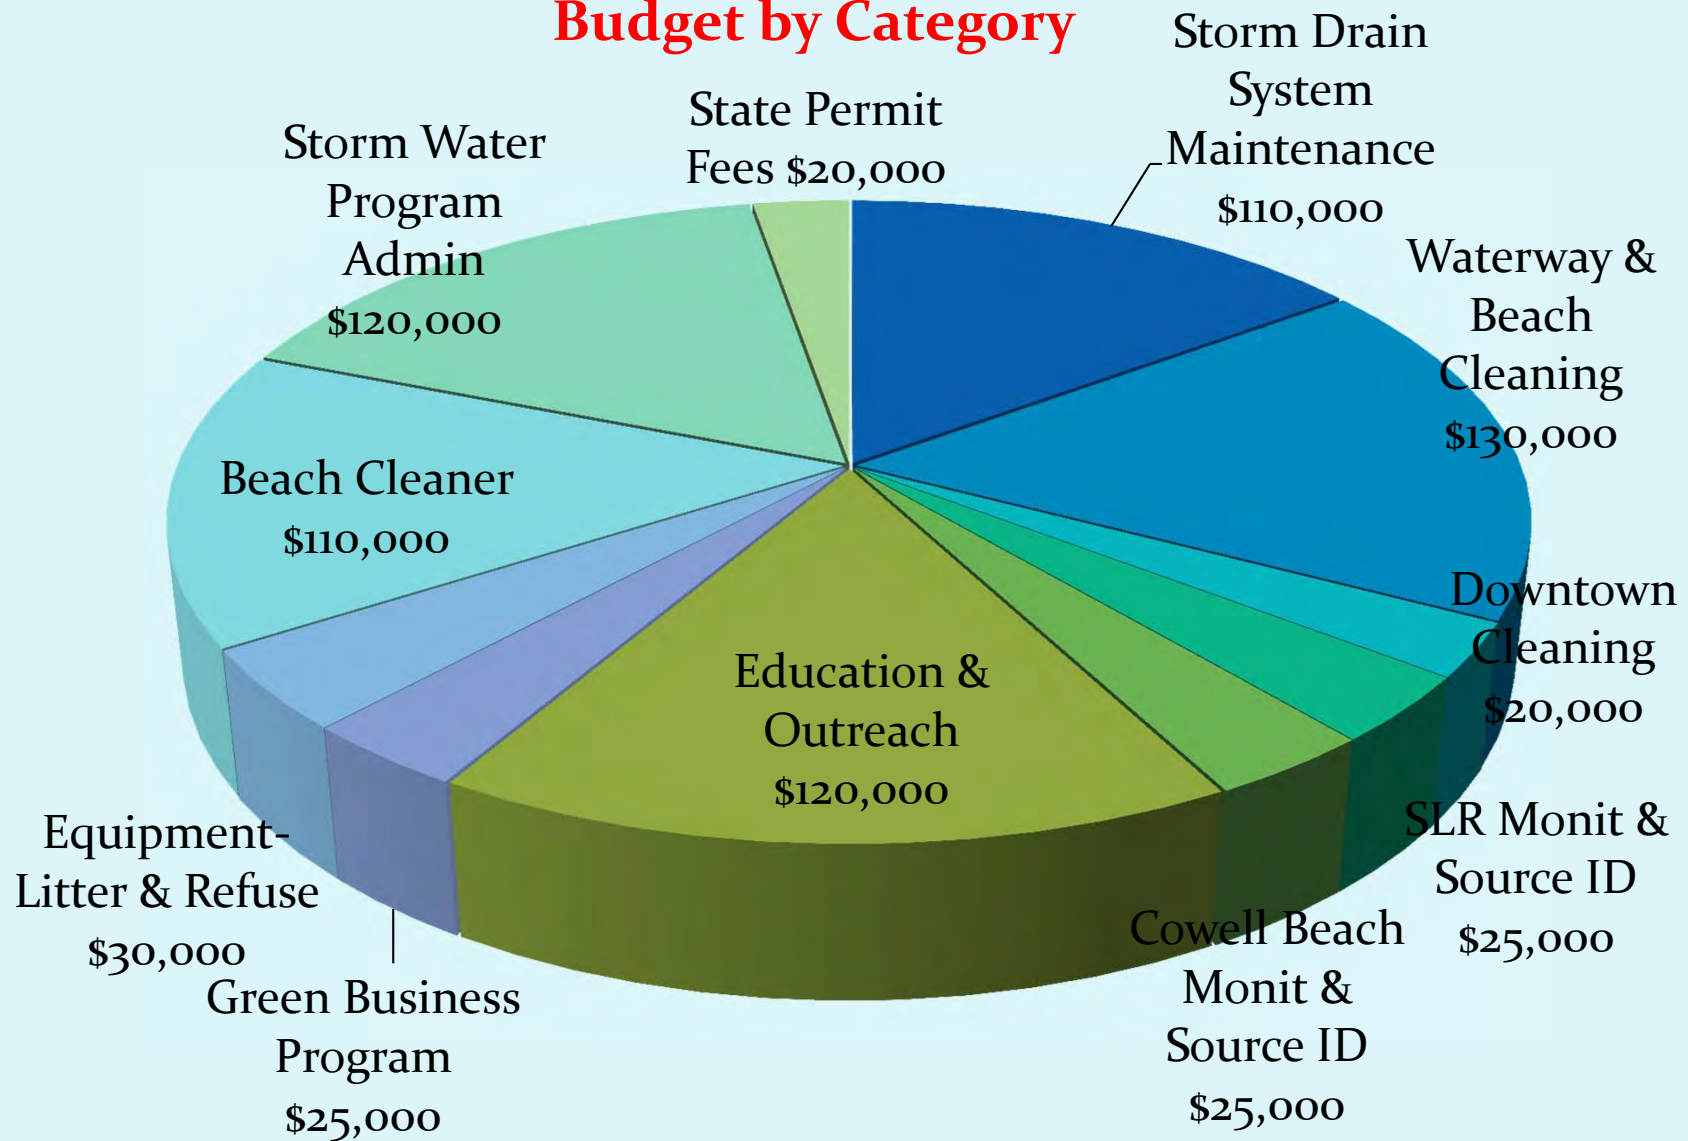

FY 2015 Expenses

- Storm Drain System Maintenance: \$110,000
- Waterway & Beach Cleaning: \$130,000
- Downtown Cleaning: \$20,000
- San Lorenzo River Monitoring & Source ID: \$25,000
- Cowell Beach Monitoring & Source ID: \$25,000
- Education & Outreach: \$120,000
- Green Business Program: \$25,000
- Equipment: Litter & Refuse: \$30,000
- Beach Cleaner: \$110,000*
- Storm Water Program Staff: \$120,000
- State Permit Fees=\$20,000

Revenue: \$630,000 Expenses: \$740,000

FY 2015 Expenses

Budget by Category

Municipal Operations

Focus on cleaning:

To keep debris & pollutants from flowing into the San Lorenzo River and Monterey Bay

- Storm drain pipelines
- Pump Stations
- River Toe Ditches
- Street Catch basins

Municipal Operations

City Crews clean:

- Storm drain pipelines-9 miles
- River pump stations-5 vaults

Municipal Operations

Storm Drain System Inspection & Cleaning:

- Extensive catch basin inspection & cleaning program. All downtown catch basins plus outlying areas inspected & cleaned.
 - Labor costs
 - Vactor Operation
 - Debris Disposal
 - Televising storm drain lines

Cost: \$110,000

Waterway, River Levee & Beach Cleaning

Ongoing Maintenance Efforts:

- San Lorenzo River
 - Parks Temp Staff-\$70,000
 - Contracted cleanups-\$25,000
 - Subtotal: \$95,000
- Cowell & Main Beaches
 - Wharf Temp Staff \$35,000

Cost: \$130,000

Beach Cleaning

Beach Cleaning Machine for Cowell & Main Beaches

Cherrington Beach Cleaner
Cost: \$110,000

Waterway, River Levee & Beach Cleaning

Parks Rangers Temp Staff-cleanups & restoration efforts

Cost=\$70,000

Municipal Operations

Downtown Cleaning: Hand Sweeping-Hope Services

Cost=\$20,000

Municipal Operations

Downtown Cleaning: Alleyways

Cleaned by contractors

River Levee & Beach Volunteer Cleanups

Save Our Shores:

- San Lorenzo River-Adopt a Levee cleanups
- San Lorenzo River-4 seasonal cleanups
- Annual Coastal Cleanup Day-beach & river cleanups
- July 4th & 5-beach outreach & cleanups
- Disposal of debris

Cost=\$25,000

Education & Outreach Program

School Programs:

- O'Neil Sea Odyssey-Field trip & class 4-5th grades
- Save The Whales-K-12th Grade class presentations
- Save Our Shores-Middle & High School assemblies and classes
- ZunZun-Musical Assemblies K-6th grades

Cost=\$35,000

Education & Outreach Program

Volunteer Monitoring & Stewardship:

- CWC Snapshot Day
- CWC San Lorenzo River Alliance

Cost=\$15,000

Education & Outreach Program

Residential Outreach:

- Arana Gulch Watershed Coordinator
- EA-Our Water Our World: pesticides & herbicides
- EA-Green Gardner Program
- RCD-Low Impact Development
- SW agencies-Region-wide TV ads

Cost=\$15,000

Education & Outreach Program

Business Outreach & Recognition:

- City Clean Ocean Business Program
- Monterey Bay Green Business Program
- Green Gardner/
Landscaping Program

Cost=\$30,000

Education & Outreach Program

Litter & Illegal Dumping:

Catch Basin Labeling (SOS)

Cost=\$10,000

Cigarette Butt
“Bait Tank”
containers

San Lorenzo River Pollution Prevention

Litter & Illegal Dumping

- Trash/Recycling and Cigarette Butt containers on SLR levee & other areas

Cost=\$15,000

SLR Watershed Monitoring

State Total Maximum Daily Load Limits: San Lorenzo River

- **TMDL: Bacteria and Sediment**
- State requires monitoring, remedial measures & reports
- Monitoring of SLR, Branciforte & Carbonera Creeks by City Lab & Env Compliance Program
- Results indicate birds and sediment are primary sources of elevated bacteria levels in SLR
- City is an active partner in the SLRA led by Coastal Watershed Council (staff time, funding, specialized lab work, data sharing)

Cost= \$25,000 (Lab)

Cowell Beach

- **City participates in Cowell Beach Working Group**
- **City & County both monitor Cowell Beach**
- **Results show low bacteria levels during winter months**
- **Sewer source unlikely since levels not high year round**

In 2014, City added caffeine test as indicator of sewage (none found so far)
In 2015, City conducted a preliminary bacteria gradient study

New State Requirements

Outfall Inventory and Sampling

- Staff checked 236 storm drain outfalls
- 26 outfalls had flows during summer and were sampled
- Results showed 1 suspect outfall which led staff to identify a cracked storm drain

New State Requirements

Construction: Erosion Control

- Grading ordinance revised June 2014: Projects need to submit erosion & sediment control plans
- Increased PW and Building staff oversight of construction projects

New State Requirements

Development: Low-Impact Design

- New (2014) requirements to collect & infiltrate (sink) storm runoff on property
- Applies to private developments, retrofits, and City projects
- *Examples of LID techniques:*

Pervious Pavement

Bio-retention

Drainage Swale

Rain Barrel

Low-Impact Development on Recent Private Projects

Madrone Street (Sports Authority)

Frederick Street (Multi-family)

West Cliff Drive (Multi-family)

Low-Impact Development on Recent City Projects

Kaiser Permanente Arena

Wharf Roundabout (not vegetated yet)

Arana Gulch Multi-Use Trail

Tannery Arts New Parking Lot

Grants & Projects

State Prop 84 Grant: Low Impact Development Design & Build Parking Lot #9

- Goal to reduce runoff & pollutant loads to River
- LID to sink rain runoff and divert pollutants into soil

Construction completed August 2015

Grants & Projects

State Prop 84 Grant: Low Impact Development Parking Lot #9

- Sloping & curb cuts to bio-swales redirect 75% of lot runoff

Grants & Projects

Bio-swales installed to sink rain runoff & filter pollutants

Vegetated bio-swale with curb cuts

Grants & Projects

Bio-swales installed to sink rain runoff & filter pollutants

Vegetated bio-swale with curb cuts

Grants & Projects

State Prop 84 Grant: Low Impact Development Design & Build Parking Lot #9

- Lot repaved as part of project
- Match \$40,000 from FY14 budget

Grants & Projects

State Clean Beaches Initiative Grant & CIP Project

- Neary Lagoon Storm Drain Improvement Project
- Goal: Reduce bacteria levels at Cowell Beach
- Storm drain pipes exit at Cowell Beach-buried under sand in summer

Neary Lagoon Beach Outlet Vault

Grants & Projects

Neary Lagoon

**Gates closed in Summer &
opened in Winter**

Installed Spring 2014

Grants & Projects

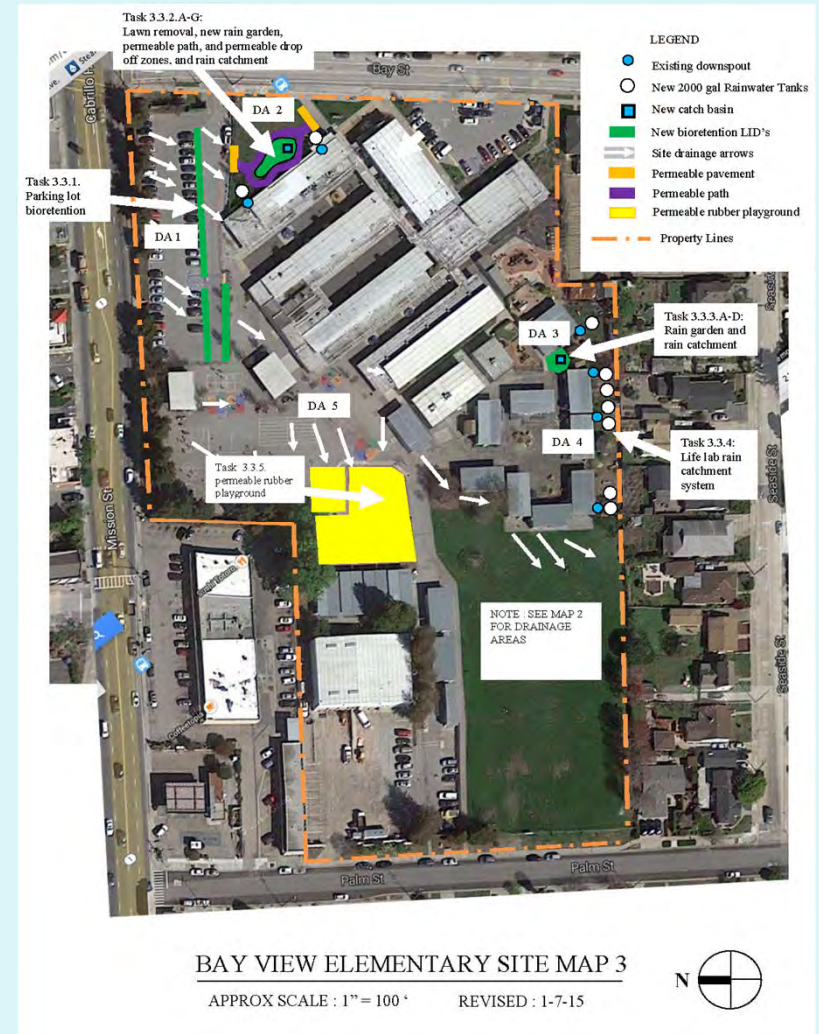

- New hatch at beach outlet vault
- Temp steel plate on gravity pipe opening at beach during summer
- Neary pump station & storm drain lines now cleaned late Spring & Fall

Grants & Projects

State DROPS Grant: Low Impact Design for Schools

- City partnered w/Santa Cruz City Schools and UCSC IDEASS
- \$486,000 Grant Awarded to SC City Schools for Bay View Elementary
- Retrofit LID project: Bio-swales, pervious playground, and rain water catchment/cisterns
- City cost \$15,000 (FY16) towards large rain garden and educational signage

The End

ATTACHMENT I-4

News

Palo Alto proceeds with storm water management fee increase

By **JACQUELINE LEE** | jlee1@bayareanewsgroup.com |

PUBLISHED: August 30, 2016 at 2:48 pm | UPDATED: August 31, 2016 at 7:56 am

PALO ALTO — Money from a proposed increase in storm water management fees would be spent more on operating costs than capital improvements, Palo Alto City Council decided on Monday, reversing a decision made earlier this year.

The council previously approved a resolution calling for a monthly fee of \$13.65, up from \$13.03.

The breakdown of the increased bill was going to be \$6.62 as the base amount and \$7.03 for capital improvements. Now, the allocation is reversed so that \$7.48 is the base and \$6.17 is for improvements.

City staff told council members that initial calculations were off because they were based on fiscal year 2016, rather than 2017, and more money is needed for operating costs.

A public protest hearing on the rate hike is set for Oct. 24. Property owners can file written opposition to the fee increase until then. If a majority does so, then the council has to terminate the fee increase process.

If there is no majority opposition, then the city will conduct a mail ballot election on the fee increase between Jan. 11 and Feb. 28.

If approved, the new fees would go into effect June 1 and generate about \$6.9 million in revenue annually for the next 15 years.

In early 2015, the city identified about \$37 million worth of capital improvements that are needed.

Property owners currently pay about \$12.63 per month in storm drain bills.

Current fees will expire in June. If no action is taken to approve updated fees, then the rates will revert to \$4.25, an amount property owners approved in 2005, which city leaders say is not enough to maintain operations.

Phone: (408) 535-7055

Storm Sewer Service Charge

Storm Sewer Service Charge Rate

The Storm Sewer Service Charge rate structure charges users of the storm sewerage system in San José based on the relative quality and quantity of stormwater runoff contributed by residential, commercial, institutional, and industrial properties. The rate structure apportions the costs of storm sewer service to properties in proportion to their relative contribution of flow and pollution to the storm sewer system.

Rates are computed to recover projected costs of the following:

- Stormwater pollution control and permit compliance
- Management, operation, maintenance, and rehabilitation of the storm sewer system
- Improvements to the storm sewer system
- Street sweeping
- Administrative services

Storm Sewer Service Charge rates are reviewed and adjusted annually, as cost and service demand levels change. The current rate structure for storm sewerage services described below became effective July 1, 2011, with San José City Council adoption of Resolution No. 75857 on June 14, 2011. The rates are structured for the estimated cost recovery requirements and the service demand levels of Fiscal Year 2011-12. View the current [residential rates](#) and [commercial rates](#).

For Fiscal Years 2013-14, 2014-15, and 2015-16, no rate increases were adopted. Rates maintain at the same level as Fiscal Year 2011-12.

If you have questions regarding rates for storm sewerage service, please call us at (408) 535-7055.

Sewer and Storm Water Fees

The charts below provide information on Sewer Fees and Storm Water Fees in the City of Alameda.

SEWER SERVICE FEE, CITY OF ALAMEDA

	FY2016	FY2017	FY2018	FY2019	FY2020
		% Increase 3.0%	% Increase 3.0%	% Increase 3.0%	% Increase 3.0%
Single Family (\$/month)	\$23.93	\$24.65	\$25.39	\$26.15	\$26.93
Multi-Family (\$/month)	\$21.54	\$22.19	\$22.86	\$23.55	\$24.26
Commercial Fixed Charge (\$/month) (includes first 730 cubic feet)	\$21.54	\$22.19	\$22.86	\$23.55	\$24.26
Flow-Based Rate (\$ per Hundred cubic feet)	\$2.96	\$3.05	\$3.14	\$3.23	\$3.33

STORM WATER FEE, CITY OF ALAMEDA

The Fee is based on the amount of pollution that the City estimates enters the municipal storm water system as a result of the installation or maintenance of impervious surfaces.

2,000 square feet of impervious surface = 1 Impervious Surface Unit (ISU)

The Fee is calculated according to the following formula:

Number of Impervious Surface Units (ISU)

multiplied by

Fee per Equivalent Residential Unit (ERU)

	Storm Water Fee
<p>Typical Single Family Residential Parcel</p> <p>A typical residential parcel has 5,000 square feet of surface area. 40 percent, or 2,000 square feet, is comprised of impervious surface (1 ISU).</p>	<p>\$56.15</p> <p>(1 Equivalent Residential Unit fee)</p>
<p>Condominium (per unit)</p> <p>A typical condo unit has 600 square feet of impervious surface area (0.3 ISU).</p>	<p>\$16.85</p> <p>(0.3 x 1 ERU)</p>

Other parcels with Impervious Surfaces are subject to the Fee based upon stated formula Fee: Number of ISUs multiplied by Fee per ERU.

DECLARATION OF SERVICE BY EMAIL

I, the undersigned, declare as follows:

I am a resident of the County of Sacramento and I am over the age of 18 years, and not a party to the within action. My place of employment is 980 Ninth Street, Suite 300, Sacramento, California 95814.

On September 27, 2017, I served the:

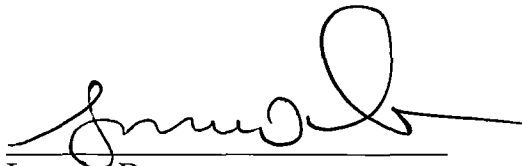

- **SWRCB and SDRWQCB Comments on the Test Claim filed September 22, 2017**

*California Regional Water Quality Control Board, San Diego Region,
Order No. R9-2010-0016, 11-TC-03*

County of Riverside, Riverside County Flood Control and Water Conservation District,
Cities of Murrieta, Temecula, and Wildomar, Co-Claimants

By making it available on the Commission's website and providing notice of how to locate it to the email addresses provided on the attached mailing list.

I declare under penalty of perjury under the laws of the State of California that the foregoing is true and correct, and that this declaration was executed on September 27, 2017 at Sacramento, California.

ATTACHMENT I-7

MEASURE CW

The Clean Water, Clean Beach Parcel Tax

During the November 8, 2016 Special Municipal Election, Culver City residents voted on Measure CW, the Clean Water, Clean Beach Parcel Tax. The results are as follows: YES - 73.82%; NO - 26.18%.

Funds raised by Measure CW will be used for improvements in water quality in Ballona Creek, Marina del Rey, Santa Monica Bay, and the Pacific Ocean. Measure CW required approval by 2/3 of those voting on the measure to pass.

Need for Measure CW

Dangerous bacteria, pesticides, toxic chemicals, oil and grease, trash and other pollutants are deposited on our roadways and flow into Ballona Creek, Marina del Rey, and the ocean through our storm drains, by rain, and other runoff water. These pollutants harm fish and wildlife, cause illness and infections for swimmers and surfers, and make beaches unsafe and unsightly for families and visitors. The State and Regional Water Quality Control Boards have implemented very strict pollution reduction regulations for storm water runoff. These regulations require the City of Culver City to develop and implement programs to reduce and prevent water pollution.

Purpose of Measure CW

Measure CW establishes an annual Clean Water, Clean Beaches Parcel Tax in the City of Culver City.

Measure CW was placed on the ballot by the City Council of the City of Culver City to create a dedicated source of funding to pay for water quality programs that will prevent pollution from reaching our waterways, beaches and the Ballona Creek Estuary. Measure CW required approval by 2/3 of those voting on the measure.

Cost of Measure CW

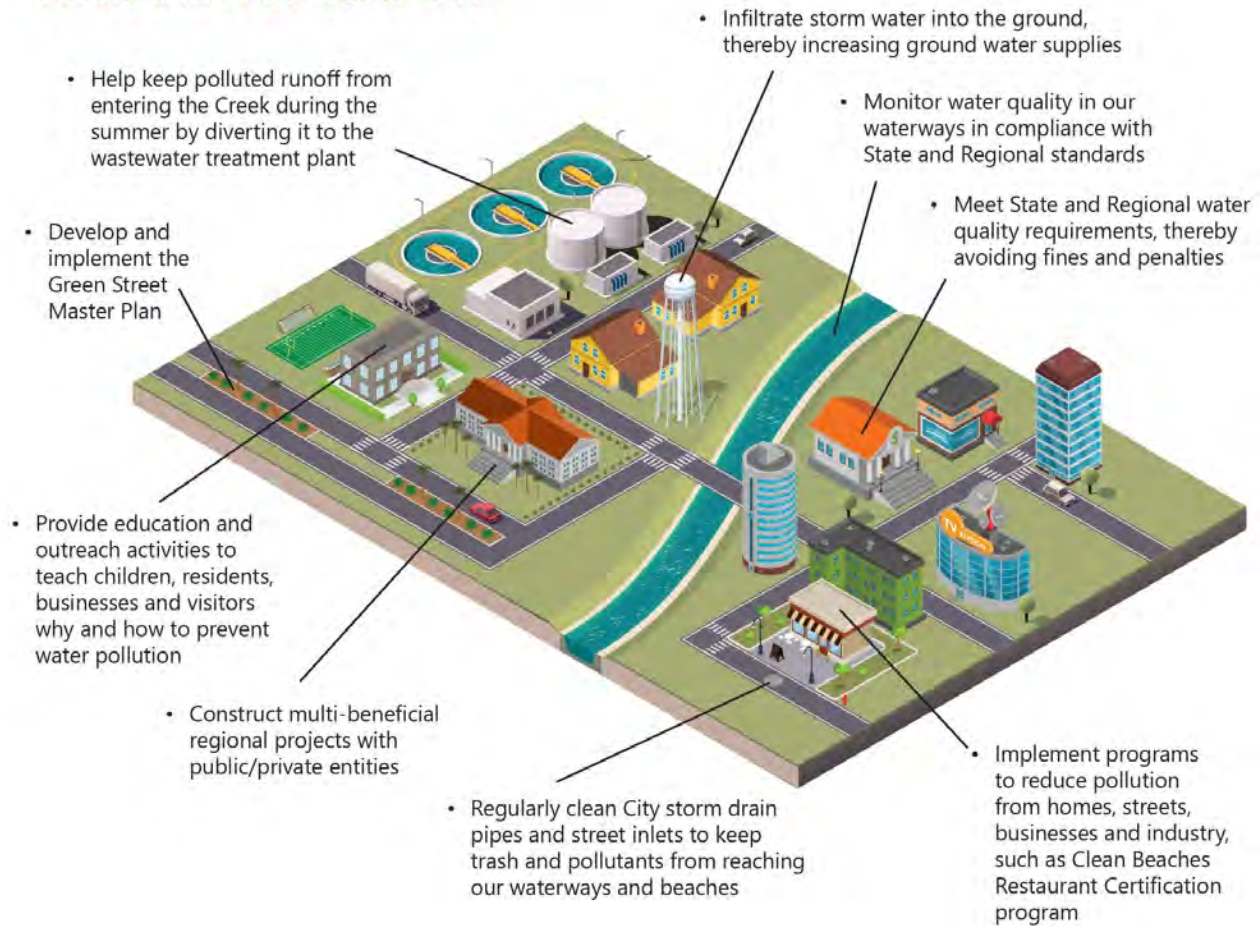

- \$99 annually per single family residential parcel
- \$69 annually per multi-family residential dwelling unit
- \$1,096 annually per acre of land or portion thereof for non-residential

Each parcel owner of a non-residential property will be taxed \$1,096 per acre of land (or portion thereof) annually. The \$1,096 will be pro-rated for non-residential parcels less than one acre. For example, a non-residential parcel of one-half acre will be taxed \$548. Land owners are taxed, not individual businesses located on the non-residential property. For larger parcels with multiple tenants, the land owner will receive one bill based on the size of the parcel, not the tenants.

Tax-exempt parcels will not be charged. Charges will first appear on the tax statements in fall 2017.

Measure CW is expected to generate about \$2 million per year. All Measure CW money will be used here in Culver City to reduce water pollution.

What will it be used for?

Use of Measure CW Funds

Measure CW funds will be placed in a special Clean Water, Clean Beaches Fund, and funds must be used exclusively for reducing and preventing water pollution and managing storm water and urban runoff. The Financial Advisory Committee will oversee how the funds are spent.

What is Integrated Pest Management (IPM)?

Integrated pest management, or IPM, is a process you can use to solve pest problems while minimizing risks to people and the environment. IPM can be used to manage all kinds of pests anywhere—in urban, agricultural, and wildland or natural areas.

Definition of IPM

IPM is an ecosystem-based strategy that focuses on long-term prevention of pests or their damage through a combination of techniques such as biological control, habitat manipulation, modification of cultural practices, and use of resistant varieties. Pesticides are used only after monitoring indicates they are needed according to established guidelines, and treatments are made with the goal of removing only the target organism. Pest control materials are selected and applied in a manner that minimizes risks to human health, beneficial and nontarget organisms, and the environment.

What is a pest?

Pests are organisms that damage or interfere with desirable plants in our fields and orchards, landscapes, or wildlands, or damage homes or other structures. Pests also include organisms that impact human or animal health. Pests may transmit disease or may be just a nuisance. A pest can be a plant (weed), vertebrate (bird, rodent, or other mammal), invertebrate (insect, tick, mite, or snail), nematode, pathogen (bacteria, virus, or fungus) that causes disease, or other unwanted organism that may harm water quality, animal life, or other parts of the ecosystem.

How does IPM work?

IPM focuses on long-term prevention of pests or their damage by managing the ecosystem

With IPM, you take actions to keep pests from becoming a problem, such as by growing a healthy crop that can withstand pest attacks, using disease-resistant plants, or caulking cracks to keep insects or rodents from entering a building.

Rather than simply eliminating the pests you see right now, using IPM means you'll look at environmental factors that affect the pest and its ability to thrive. Armed with this information, you can create conditions that are unfavorable for the pest.

In IPM, monitoring and correct pest identification help you decide whether management is needed

Monitoring means checking your field, landscape, forest, or building—or other site—to identify which pests are present, how many there are, or what damage they've caused. Correctly identifying the pest is key to knowing whether a pest is likely to become a problem and determining the best management strategy.

After monitoring and considering information about the pest, its biology, and environmental factors, you can decide whether the pest can be tolerated or whether it is a problem that warrants control. If control is needed, this information also helps you select the most effective management methods and the best time to use them.

IPM programs combine management approaches for greater effectiveness

The most effective, long-term way to manage pests is by using a combination of methods that work better together than separately. Approaches for managing pests are often grouped in the following categories.

Biological control

Biological control is the use of natural enemies—predators, parasites, pathogens, and competitors—to control pests and their damage.

Invertebrates, plant pathogens, nematodes, weeds, and vertebrates have many natural enemies.

(<http://www2.ipm.ucanr.edu>) MENU

UC IPM (<http://www2.ipm.ucanr.edu>) is a peer-reviewed journal of IPM management, reproduction, dispersal, and survival. For example, changing irrigation practices can reduce pest problems, since too much water can increase root disease and weeds.

Mechanical and physical controls

Mechanical and physical controls kill a pest directly, block pests out, or make the environment unsuitable for it. Traps for rodents are examples of mechanical control. Physical controls include mulches for weed management, steam sterilization of the soil for disease management, or barriers such as screens to keep birds or insects out.

Chemical control

Chemical control is the use of pesticides. In IPM, pesticides are used only when needed and in combination with other approaches for more effective, long-term control. Pesticides are selected and applied in a way that minimizes their possible harm to people, nontarget organisms, and the environment. With IPM you'll use the most selective pesticide that will do the job and be the safest for other organisms and for air, soil, and water quality; use pesticides in bait stations rather than sprays; or spot-spray a few weeds instead of an entire area.

IPM is based on scientific research

Hear UC IPM scientist Pete Goodell talk about the scientific basis for IPM.  (http://ucanr.edu/sites/OrchardIPM/Video_Library_875/Viewpoints_from_researchers/Pete_Goodell/) (7 min)

IPM programs

These IPM principles and practices are combined to create IPM programs. While each situation is different, six major components are common to all IPM programs:

1. Pest identification
2. Monitoring and assessing pest numbers and damage
3. Guidelines for when management action is needed
4. Preventing pest problems
5. Using a combination of biological, cultural, physical/mechanical and chemical management tools
6. After action is taken, assessing the effect of pest management

Special Message to the Congress Outlining the 1972 Environmental Program

February 8, 1972

To the Congress of the United States:

From the very first, the American spirit has been one of self-reliance and confident action. Always we have been a people to say with Henry "I am the master of my fate . . . the captain of my soul"—a people sure that man commands his own destiny. What has dawned dramatically upon us in recent years, though, is a new recognition that to a significant extent man commands as well the very destiny of this planet where he lives, and the destiny of all life upon it. We have even begun to see that these destinies are not many and separate at all—that in fact they are indivisibly one.

This is the environmental awakening. It marks a new sensitivity of the American spirit and a new maturity of American public life. It is working a revolution in values, as commitment to responsible partnership with nature replaces cavalier assumptions that we can play God with our surroundings and survive. It is leading to broad reforms in action, as individuals, corporations, government, and civic groups mobilize to conserve resources, to control pollution, to anticipate and prevent emerging environmental problems, to manage the land more wisely, and to preserve wildness.

In messages to the Congress during 1970 and 1971 I proposed comprehensive initiatives reflecting the earliest and most visible concerns of the environmental awakening. The new cast of the public mind had to be translated into new legislation. New insights had to have new governmental forms and processes through which to operate. Broadly-based problems—such as air pollution, water pollution and pesticide hazards had to be dealt with first.

The necessary first steps in each of these areas have now been taken, though in all of them the work is far from completed. Now, as we press on with that work in 1972, we must also come to grips with the basic factors which underlie our more obvious environmental problems—factors like the use of land and the impact of incentives or disincentives built into our economic system. We are gaining an increasingly sophisticated understanding of the way economic, institutional, and legal forces shape our surroundings for good or ill; the next step is understanding how to turn such forces to environmental benefit.

Primary responsibility for the actions that are needed to protect and enhance our environment rests with State and local government, consumers, industry, and private organizations of various kinds—but the Federal Government must provide leadership. On the first day of this decade I stated that "it is literally now or never" for true quality of life in America. Amid much encouraging evidence that it can and will be "now," we must not slacken our pace but accelerate it. Environmental concern must crystallize into permanent patterns of thought and action. What began as environmental awakening must mature finally into a new and higher environmental way of life. If we flag in our dedication and will, the problems themselves will not go away. Toward keeping the momentum of awareness and action, I pledge my full support and that of this Administration, and I urgently solicit the continuing cooperation of the Congress and the American people.

TWO YEARS' AGENDA

FROM CONSIDERATION TO ACTION

In my 1971 environmental message, just one year ago today, I sent to the Congress a comprehensive program designed to clean up the problems of the past, and to deal with emerging problems before they become critical. These proposals included:

Regulation of toxic substances

Comprehensive improvement in pesticide control authority

Noise control

Preservation of historic buildings

Power plant siting

Regulation of environmental effects of surface and underground mining Ocean

dumping regulation

More effective control of water pollution through a greatly expanded waste treatment grant program and strengthened standard-setting and enforcement authorities

A National Land Use Policy Act Substantial expansion of the wilderness system Expanded international cooperation.

To date, most of the legislation on this list has been the subject of congressional hearings; most of it has attracted heartening interest and support; but none of it has yet received final congressional action. Last year was, quite properly, a year of consideration of these measures by the Congress. I urge, however, that this be a year of action on all of them, so that we can move on from intention to accomplishment in the important needs they address. Passage of these measures and creation of the unified Department of Natural Resources which I also proposed in 1971—by this 92nd Congress—will be essential if we are to have an adequate base for improving environmental quality.

BUILDING ON THE BASE

As that base is being established, we must move ahead to build wisely and rapidly upon it. I shall outline today a plan for doing that, with initiatives and actions in the following areas:

--Tightening pollution control

A Toxic Wastes Disposal Control Act

Legislation to control sediment from construction activities

An emissions charge to reduce sulfur oxide air pollution

Clean energy research and energy conservation measures

--Making technology an environmentally

Integrated pest management

Stepped-up research on noise control

Stepped-up research on air pollution effects and measurement

--Improving land use

Expansion and strengthening of the National Land Use Policy Act

Protection of wetlands

--Protecting our natural heritage

A ban on use of poisons for predator control on public lands

A stronger law to protect endangered species of wildlife

Big Cypress National Fresh Water Reserve

National Recreation Areas around New York Harbor and the Golden Gate

Conversion of 20 additional Federal properties to recreational use

18 new Wilderness Areas Regulation of off-road vehicles on Federal lands

--Expanding international cooperation on the environment

Establishment of a United Nations

Fund for the Environment

Further measures to control marine pollution

--Protecting children from lead-based paint

--Enlisting the young

President's Environmental Merit Awards Program for high schools
Youth opportunities in the Department of Agriculture Field Scout program.

TIGHTENING POLLUTION CONTROL

The legislative framework for dealing with our major air pollution problems has become law, and I have made comprehensive recommendations regarding water pollution control. But several problems remain to be addressed which are difficult to deal with under the general pollution control authorities.

DISPOSAL OF TOXIC WASTES

Increasingly strict air and water pollution control laws and their more effective enforcement have led to greater reliance on land--both surface and underground--for disposal of waste products from the toxic substances being used in ever greater volume and variety in our society. Without adequate controls, such waste disposal may cause contamination of underground and surface waters leading to direct health hazards.

--I propose a Toxic Wastes Disposal Act, under which the Environmental Protection Agency would establish Federal guidelines and requirements for State programs to regulate disposal on or under the land of those toxic wastes which pose a hazard to health. The act would provide for Federal enforcement action if a State should fail to establish its own program.

SEDIMENT CONTROL

Sediment, small particles of soil which enter the water, is the most pervasive water pollution problem which does not come primarily from municipal or industrial sources. Heavy loads of sediment interfere with many beneficial uses of water, such as swimming and water supply, and can change the entire character of an aquatic environment. Many of our great waterways are afflicted with this problem. In our urban areas, a significant amount of sediment comes from construction. However, if proper construction practices are followed, sediment runoff from this source can be greatly reduced.

--I propose legislation calling upon the States to establish, through appropriate local and regional agencies, regulatory programs to control sediment affecting water quality from earth-moving activities such as building and road construction.

The Environmental Protection Agency, together with other Federal agencies, would develop Federal guidelines for appropriate control measures. Federal enforcement would take place in situations where a State failed to implement such a program.

SULFUR OXIDES EMISSIONS CHARGE

In my 1971 Environmental Message, I announced plans to ask for imposition of a charge on sulfur oxides emissions, one of the air pollutants most damaging to human health and property, and vegetation. The Council on Environmental Quality, the Treasury Department and the Environmental Protection Agency have now completed their studies on this measure and have developed the details of an emission charge proposal.

--I propose a charge on sulfur emitted into the atmosphere from combustion, refining, smelting, and other processes.

This charge would begin in 1976 and apply in all regions where the air quality does not meet national standards for sulfur oxides during 1975. The charge would be 15¢ per pound on sulfur emitted in regions where the primary standards--which are designed to be protective of public health--have not been met within the deadline for achievement prescribed in the Clean Air Act. In regions where air quality met the primary standard but exceeded the secondary national standard--designed to protect property, vegetation, and aesthetic values--a charge of \$.10 per pound of sulfur emitted would apply. Areas which reduce emissions sufficiently to meet both primary and secondary air quality standards would be exempt from the emission charge.

This charge is an application of the principle that the costs of pollution should be included in the price of the product. Combined with our existing regulatory authority, it would constitute a strong economic incentive to achieve the sulfur oxides standards necessary to protect health, and then further to reduce emissions to levels which protect welfare and aesthetics.

CLEAN ENERGY GENERATION AND

CONSERVATION

Ours is an energy-based economy, and energy resources are the basis for future economic progress. Yet the consumption of energy-producing fuels contributes to many of our most serious pollution problems. In order to have both environmental quality and an improving standard of living, we will need to develop new clean energy sources and to learn to use energy more efficiently.

Our success in meeting energy needs while preventing adverse environmental effects from energy generation and transmission will depend heavily on the state of available technology. In my message to the Congress on energy of last June, I announced a series of steps to increase research on clean and efficient energy production. But further action is needed.

--As part of my new commitment to augment Federal research and development and target it more effectively on solving domestic problems, I have requested in the 1973 budget an additional \$88 million for development of a broad spectrum of new technologies for producing clean energy.

In addition to carrying forward the priority efforts I have already announced the liquid metal fast breeder reactor, pipeline quality gas from coal, and sulfur oxide control technology--the budget provides funds for new or increased efforts on fusion power, solar energy, magneto-hydrodynamics, industrial gas from coal, dry cooling towers for power plant waste heat, large energy storage batteries and advanced underground electric transmission lines. These new efforts relate to both our immediate and our future energy problems, and are needed to assure adequate supplies of clean energy.

My message on energy also announced several steps that would be taken by the Federal Government to use energy more efficiently and with less environmental harm. One of these steps was issuance by the Secretary of Housing and Urban Development of revised standards for insulation in new federally insured houses. The new standards for single-family structures, which have now been issued through the Federal Housing Administration, reduce the maximum permissible heat loss by about one-third for a typical home. The fuel savings which will result from the application of these new standards will, in an average climate, exceed in one year the cost of the additional insulation required.

--I am now directing the Secretary of Housing and Urban Development to issue revised insulation standards for apartments and other multifamily structures not covered by the earlier revision. The new rules will cut maximum permissible heat loss by 40%.

The savings in fuel costs after a 5-year period will on the average more than offset the additional construction costs occasioned by these revised standards.

These stricter insulation standards are only one example of administrative actions which can be taken by the Federal Government to eliminate wasteful use of energy. The Federal Government can and must provide leadership by finding and implementing additional ways of reducing such waste.

--I have therefore instructed the Council on Environmental Quality and the Office of Science and Technology, working with other Federal agencies, to conduct a survey to determine what additional actions might be taken to conserve energy in Federal activities.

This survey will look at innovative ways to reduce wasteful consumption of energy while also reducing total costs and undesirable environmental impact.

RECYCLING

Recycling--the technique which treats many types of solid wastes not as pollutants but as recoverable and reusable "resources out of place"--is an important part of the answer to the Nation's solid waste burden. Last year, at my direction, the General Services Administration began reorienting government procurement policies to set a strong Federal example in the use of recycled products.

--Because Federal tax policy should also offer recycling incentives, the Treasury Department is clarifying the availability of tax exempt treatment industrial revenue bond financing for the construction of recycling facilities built by private concerns to recycle their own wastes.

THE ENVIRONMENTAL TRANSITION

Many environmental problems are influenced by the way our economy operates. Conversely, efforts to improve environmental quality have an impact on the economy. Our national income accounting does not explicitly recognize the cost of pollution damages to health, materials, and aesthetics in the computation of our economic well-being. Many goods and services fail to

bear the full costs of the damages they cause from pollution, and hence are underpriced.

Environmental quality requirements will affect many of our industries by imposing new costs on production. We know that these impacts fall unevenly on industries, new and old firms, and on communities, but little concrete data has been available. Contract studies have recently been performed for the Council on Environmental Quality, the Environmental Protection Agency, and the Department of Commerce, under the policy guidance of the Council of Economic Advisers. These initial studies suggest that pollution control costs will result in some price increases, competitive trade disadvantages, and employment shifts. The major impact of these costs will be on older, and usually smaller plants.

As long as we carefully set our environmental goals to assure that the benefits we achieve are greater than the social and economic costs, the changes which will occur in our economy are desirable, and we as a Nation will benefit from them.

MAKING TECHNOLOGY AN ENVIRONMENTAL ALLY

The time has come to increase the technological resources allocated to the challenges of meeting high-priority domestic needs. In my State of the Union Message last month, I announced an expanded Federal research and development commitment for this purpose. There is great potential for achievement through technology in the fight against pollution and the larger drive for quality in our environment.

The temptation to cast technology in the role of ecological villain must be resisted--for to do so is to deprive ourselves of a vital tool available for enhancing environmental quality. As Peter Drucker has said, "the environment is a problem of [the] success"¹ of technological society, by no means a proof of its failure. The difficulties which some applications of technology have engendered might indeed be rectified by turning our backs on the 20th century, but only at a price in privation which we do not want to pay and do not have to pay. There is no need to throw out the baby with the bath water. Technology can and must be wisely applied so that it becomes environmentally self-corrective. This is the standard for which we must aim.

¹ Peter F. Drucker, "The Age of Discontinuity: Guidelines to Our Changing Society" (Harper and Row, 1969).

INTEGRATED PEST MANAGEMENT

Chemical pesticides are a familiar example of a technological innovation which has provided important benefits to man but which has also produced unintended and unanticipated harm. New technologies of integrated pest management must be developed so that agricultural and forest productivity can be maintained together with, rather than at the expense of, environmental quality. Integrated pest management means judicious use of selective chemical pesticides in combination with nonchemical agents and methods. It seeks to maximize reliance on such natural pest population controls as predators, sterilization, and pest diseases. The following actions are being taken:

--I have directed the Department of Agriculture, the National Science Foundation, and the Environmental Protection Agency to launch a large-scale integrated pest management research and development program. This program will be conducted by a number of our leading universities.

--I have directed the Department of Agriculture to increase field testing of promising new methods of pest detection and control. Also, other existing Federal pesticide application programs will be examined for the purpose of incorporating new pest management techniques.

--I have directed the Departments of Agriculture and of Health, Education, and Welfare to encourage the development of training and certification programs at appropriate academic institutions in order to provide the large number of crop protection specialists that will be needed as integrated pest management becomes more fully utilized.

--I have authorized the Department of Agriculture to expand its crop field scout demonstration program to cover nearly four million acres under agricultural production by the upcoming growing season.

Through this program many unnecessary pesticide applications can be eliminated, since the scouts will be used to determine when pesticide applications are actually needed.

In my message on the environment last February, I proposed a comprehensive revision of our pesticide control laws--a revision which still awaits final congressional action. Also essential to a sound national pesticide policy are measures to ensure that agricultural workers are protected from adverse exposures to these chemicals.

--I am directing the Departments of Labor and Health, Education, and Welfare to develop standards under the Occupational Safety and Health Act to protect such workers from pesticide poisoning.

NOISE CONTROL RESEARCH

Scientific findings increasingly confirm what few urban dwellers or industrial workers need to be told--that excessive noise can constitute a significant threat to human well-being. The Congress already has before it a comprehensive noise control bill, which I proposed a year ago. A quieter environment cannot simply be legislated into being. We shall also need to develop better methods to achieve our goal.

--I have requested in my 1973 budget a \$23 million increase in research and development funds for reducing noise from airplanes. I have also requested new funds for research and development for reducing street traffic noise.

RESEARCH ON AIR POLLUTION EFFECTS

AND MEASUREMENT

Our pollution control efforts are based largely on the establishment of enforceable standards of environmental quality. Initial standards have often been based on incomplete knowledge because the necessary information has not been available. Also, the lack of adequate instruments to measure pollution and of models of how pollutants are dispersed has made it difficult to know exactly how much pollution must be controlled in a particular area. We need added research and development to make more precise judgments of what standards should be set and how we can most practically achieve our goals.

--I have requested in my 1973 budget an additional \$12 million to increase research on the health effects of air pollution, on regional air pollution modeling, and on improved pollution instrumentation and measurement.

IMPROVING LAND USE

In recent years we have come to view our land as a limited and irreplaceable resource. No longer do we imagine that there will always be more of it over the horizon--more woodlands and shorelands and wetlands--if we neglect or overdevelop the land in view. A new maturity is giving rise to a land ethic which recognizes that improper land use affects the public interest and limits the choices that we and our descendants will have.

Now we must equip our institutions to carry out the responsibility implicit in this new outlook. We must create the administrative and regulatory mechanisms necessary to assure wise land use and to stop haphazard, wasteful, or environmentally damaging development. Some States are moving ahead on their own to develop stronger land-use institutions and controls. Federal programs can and should reinforce this encouraging trend.

NATIONAL LAND USE POLICY ACT

The National Land Use Policy Act, which I proposed to the Congress last year, would provide Federal assistance to encourage the States, in cooperation with local governments, to protect lands which are of critical environmental concern and to control major development. While not yet enacted, this measure has been the subject of much useful debate.

--I propose amendments to this pending National Land Use Policy legislation which would require States to control the siting of major transportation facilities, and impose sanctions on any State which does not establish an adequate land use program.

Under these amendments, the State programs established pursuant to the act would not only have to embody methods for controlling land use around key growth-inducing developments such as highways, airports, and recreational facilities; the States would also have to provide controls over the actual siting of the major highways and airports themselves. The change recognizes the fact that these initial siting decisions, once made, can often trigger runaway growth and adverse environmental effects.

The amendments would further provide that any State that had not established an acceptable land use program by 1975 would be subject to annual reductions of certain Federal funds. Seven percent of the funds allocated under sections of the Airport and Airways Development Act, the Federal-Aid Highway Act including the Highway Trust Fund, and the Land and Water Conservation Fund, would be withheld in the first year. An additional 7 percent would be withheld for each additional year that a State was without an approved land use program. Money thus withheld from noncomplying States would be allocated among States which did have acceptable programs.

These strong new amendments are necessary in view of the significant effect that Federal programs, particularly transportation programs, have upon land use decisions.

PROTECTION OF WETLANDS

The Nation's coastal and estuarine wetlands are vital to the survival of a wide variety of fish and wildlife; they have an important function in controlling floods and tidal forces; and they contain some of the most beautiful areas left on this continent. These same lands, however, are often some of the most sought-after for development. As a consequence, wetland acreage has been declining as more and more areas are drained and filled for residential, commercial, and industrial projects.

My National Land Use Policy Act would direct State attention to these important areas by defining wetlands among the "environmentally critical areas" which it singles out for special protection, and by giving priority attention to the coastal zones. I propose to supplement these safeguards with new economic disincentives to further discourage unnecessary wetlands development.

--I propose legislation to limit applicability of certain Federal tax benefits when development occurs in coastal wetlands.

MANAGEMENT OF PUBLIC LANDS

During 1971, I acted to strengthen the environmental requirements relating to management and use of the Nation's vast acreage of federally-owned public lands administered by the Department of the Interior. I proposed new legislation to establish an overall management policy for these public lands, something which we have been without for far too long. This legislation, still pending before the Congress, would direct the Secretary of the Interior to manage our public lands in a manner that would protect their environmental quality for present and future generations. The policy which it would establish declares the retention of the public lands to be in the national interest except where disposal of particular tracts would lead to a significant improvement in their management, or where the disposal would serve important public objectives which cannot be achieved on non-public lands.

PROTECTING OUR NATURAL HERITAGE

Wild places and wild things constitute a treasure to be cherished and protected for all time. The pleasure and refreshment which they give man confirm their value to society. More importantly perhaps, the wonder, beauty, and elemental force in which the least of them share suggest a higher right to exist--not granted them by man and not his to take away. In environmental policy as anywhere else we cannot deal in absolutes. Yet we can at least give considerations like these more relative weight in the seventies, and become a more civilized people in a healthier land because of it.

PREDATOR CONTROL

Americans today set high value on the preservation of wildlife. The old notion that "the only good predator is a dead one" is no longer acceptable as we understand that even the animals and birds which sometimes prey on domesticated animals have their own value in maintaining the balance of nature.

The widespread use of highly toxic poisons to kill coyotes and other predatory animals and birds is a practice which has been a source of increasing concern to the American public and to the federal officials responsible for the public lands.

Last year the Council on Environmental Quality and the Department of the Interior appointed an Advisory Committee on Predator Control to study the entire question of predator and related animal control activities. The Committee found that persistent poisons have been applied to range and forest lands without adequate knowledge of their effects on the ecology or their utility in preventing losses to livestock. The large-scale use of poisons for control of predators and field rodents has resulted in unintended losses of other animals and in other harmful effects on natural ecosystems. The Committee concluded that necessary control of coyotes and other predators can be accomplished by methods other than poisons.

Certainly, predators can represent a threat to sheep and some other domesticated animals. But we must use more selective methods of control that will preserve ecological values while continuing to protect livestock.

--I am today issuing an Executive Order [11643] barring the use of poisons for predator control on all public lands. (Exceptions will be made only for emergency situations.) I also propose legislation to shift the emphasis of the current direct Federal predator control program to one of research and technical and financial assistance to the States to help them control predator populations by means other than poisons.

ENDANGERED SPECIES

It has only been in recent years that efforts have been undertaken to list and protect those species of animals whose continued existence is in jeopardy. Starting with our national symbol, the bald eagle, we have expanded our concern over the extinction of these animals to include the present list of over 100. We have already found, however, that even the most recent act to protect endangered species, which dates only from 1969, simply does not provide the kind of management tools needed to act early enough to save a vanishing species. In particular, existing laws do not generally allow the Federal Government to control shooting, trapping, or other taking of endangered species.

--I propose legislation to provide for early identification and protection of endangered species. My new proposal would make the taking of endangered species a Federal offense for the first time, and would permit protective measures to be undertaken before a species is so depleted that regeneration is difficult or impossible.

MIGRATORY SPECIES

The protection of migratory species, besides preserving wildlife values, exemplifies cooperative environmental effort among the United States, Canada, and Mexico. By treaties entered into among these three countries, migratory species are protected. New species may be added by common agreement between the United States and Mexico.

--I have authorized the Secretary of State, in conjunction with the Secretary of the Interior, to seek the agreement of the Mexican Government to add 33 new families of birds to the protected list.

Included in the proposal are eagles, hawks, falcons, owls, and many of the most attractive species of wading birds. I am hopeful that treaty protection can be accorded them in the near future.

BIG CYPRESS NATIONAL FRESH WATER

RESERVE

After careful review of the environmental significance of the Big Cypress Swamp in Florida, particularly of the need for water from this source to maintain the unique ecology of Everglades National Park, I directed the Secretary of the Interior to prepare legislation to create the Big Cypress National Fresh Water Reserve. This legislation, which has now been submitted to the Congress, will empower the Federal Government to acquire the requisite legal interest in 547,000 acres of Big Cypress.

NEW PARKLANDS AT THE GATEWAYS

The need to provide breathing space and recreational opportunities in our major urban centers is a major concern of this Administration. Two of the Nation's major gateways to the world--New York City and San Francisco--have land nearby with exceptional scenic and recreational potential, and we are moving to make that land available for people to enjoy. In May of 1971, I proposed legislation to authorize a Gateway National Recreation Area in New York and New Jersey. This proposal would open to a metropolitan region of more than 14 million people a National Recreation Area offering more than 23,000 acres of prime beaches, wildlife preserves, and historical attractions including the nation's oldest operating lighthouse.

On our western shore lies another area uniquely appropriate for making recreational and scenic values more accessible to a metropolitan community.

--I propose legislation to establish a Golden Gate National Recreation Area in and around San Francisco Bay.

This proposal would encompass a number of existing parks, military reservations, and private lands to provide a full range of recreation experiences. Altogether, the area would encompass some 24,000 acres of fine beaches, rugged coasts, and readily accessible urban parklands, extending approximately 30 miles along some of America's most beautiful coastline north and south of Golden Gate Bridge. Angel and Alcatraz Islands in the bay would be within the boundaries of the National Recreation Area, as would a number of properties on the mainland which afford magnificent views of the city, the bay and the ocean. As part of this plan, I am directing that the Presidio at San Francisco be opened for dual military and civilian recreational uses.

CONVERTING FEDERAL PROPERTIES TO

PARKS

Among the most important legacies that we can pass on to future generations is an endowment of parklands and recreational areas that will enrich leisure opportunities and make the beauties of the earth and sea accessible to all Americans. This is the object of our Legacy of Parks program, initiated early in 1971. As part of this program, I directed the Property Review Board to give priority to potential park and recreation areas in its search for alternative uses of federally held real property. The results of this search so far have been most encouraging. To the original 40 properties which I announced in my Environmental Message of 1971 as being well suited for park use, another 111 prospects have been added. And from this total of 151 prospective parklands, 63 have already been made available.

--Today I am pleased to announce that 20 more parcels of Federal land are being made available for park and recreation use.

These newest parcels, combined with those which have been announced over the past year, provide a legacy of 83 parklands for America which comprise 14,585 acres in 31 States and Puerto Rico. The estimated fair market value of these properties is over \$56 million. In the months to come, every effort will be made to extend this legacy to all 50 States. The green spaces and natural retreats that we tend to take for granted will not be available for future enjoyment unless we act now to develop and protect them.

WILDERNESS AREAS

One of the first environmental goals I set when I took office was to stimulate the program to identify and recommend to the Congress new wilderness areas. Although this program was behind schedule at that time, I am now able to report that the September, 1974 statutory deadline for reviews can and will be met.

The Wilderness Act of 1964 set aside 54 areas, consisting of about 9.1 million acres, as the nucleus of our wilderness system. Since then, 33 new areas totalling almost 1.2 million acres within National Forests, National Parks, and National Wildlife Refuges have been added to the system. Thirty-one areas totalling about 3.6 million acres, including 18 areas submitted by this Administration, have been proposed to the Congress but have yet to be acted upon. One of the most significant elements of this process has been the active participation by the public in all of its phases. At public wilderness hearings held all across the country, fair consideration has been given to all interests and points of view, with constructive citizen involvement in the decision-making process.

--I am today proposing 18 new wilderness areas which, when approved, will add another 1.3 million acres to the wilderness system.

Eight of these proposals are within the National Forests, four are within National Park areas, and six are in National Wildlife Refuges.

Of these areas, 1.2 million acres would be in the following National Forests: Blue Range National Forest, Arizona and New Mexico; Agua Tibia and Emigrant National Forests, California; Eagles Nest and Weminuche National Forests, Colorado; Mission Mountains National Forest, Montana; Aldo Leopold National Forest, New Mexico; and Glacier National Forest, Wyoming.

A total of 40,000 acres would be in our National Park system in the following locations: Black Canyon of the Gunnison National Monument, Colorado; Bryce Canyon National Park, Utah; Chiricahua National Monument, Arizona; Colorado National Monument, Colorado.

Finally, a total of 87,000 acres would be in areas administered by the Fish and Wildlife Services of the Department of the Interior in the following locations: St. Marks, National Wildlife Refuge, Florida; Wolf Island, National Wildlife Refuge, Georgia; Moosehorn National Wildlife Refuge, Maine; San Juan Islands, National Wildlife Refuge, Washington; Cape Romain, National Wildlife Refuge, South Carolina; and Bosque del Apache, National Wildlife Refuge, New Mexico.

The year 1972 can bring some of the greatest accomplishment in wilderness preservation since passage of the Wilderness Act in 1964. I urge prompt and systematic consideration by the Congress of these 18 new proposals and of the \$1 currently pending before it. Approval of all 49 additions would bring the system up to a total of over 15 million acres.

Unfortunately, few of these wilderness areas are within easy access of the most populous areas of the United States. The major purpose of my Legacy of Parks program is to bring recreation opportunities closer to the people, and while wilderness is only one such opportunity, it is a very important one. A few of the areas proposed today or previously are in the eastern sections of the country, but the great majority of wilderness areas are found in the West. This of course is where most of our pristine wild areas are. But a greater effort can still be made to see that wilderness recreation values are preserved to the maximum extent possible, in the regions where most of our people live.

--I am therefore directing the Secretaries of Agriculture and the Interior to accelerate the identification of areas in the Eastern United States having wilderness potential.

OFF-ROAD VEHICLES

A recent study by the Department of the Interior estimated that Americans own more than 5 million off-road recreational vehicles--motorcycles, minibikes, trail bikes, snowmobiles, dune-buggies, all-terrain vehicles, and others. The use of these vehicles is dramatically on the increase: data show a three-fold growth between 1967 and 1971 alone.

As the number of off-road vehicles has increased, so has their use on public lands. Too often the land has suffered as a result. Increasingly, Federal recreational lands have become the focus of conflict between the newer motorized recreationist and the traditional hiker, camper, and horseback rider. In the past, Federal land-management agencies have used widely varying approaches to dealing with this conflict. The time has come for a unified Federal policy toward use of off-road vehicles on Federal lands.

--I have today signed an Executive Order [11644] directing the Secretaries of Agriculture, Interior, Army and the Board of Directors of the Tennessee Valley Authority to develop regulations providing for control over the use of off-road vehicles on Federal lands.

They will designate areas of use and non-use, specify operating conditions that will be necessary to minimize damage to the natural resources of the Federal lands, and ensure compatibility with other recreational uses, taking into account noise and other factors.

EXPANDING INTERNATIONAL COOPERATION ON THE ENVIRONMENT

We are now growing accustomed to the view of our planet as seen from space--a blue and brown disk shrouded in white patches of clouds. But we do not ponder often enough the striking lesson it teaches about the global reach of environmental imperatives. No matter what else divides men and nations, this perspective should unite them. We must work harder to foster such world environmental consciousness and shared purpose.

UNITED NATIONS CONFERENCE ON THE HUMAN ENVIRONMENT

To cope with environmental questions that are truly international, we and other nations look to the first world conference of governments ever convened on this subject: the United Nations Conference on the Human Environment, to be held in Stockholm, Sweden, in June of this year. This should be a seminal event of the international community's attempt to cope with these serious, shared problems of global concern that transcend political differences.

But efforts to improve the global environment cannot go forward without the means to act.

--To help provide such means, I propose that a voluntary United Nations Fund for the Environment be established, with an initial funding goal of \$100 million for the first 5 years.

This Fund would help to stimulate international cooperation on environmental problems by supporting a centralized coordination point for United Nations activities in this field. It would also help to bring new resources to bear on the increasing number of worldwide problems through activities such as monitoring and cleanup of the oceans and atmosphere.

--If such a Fund is established, I will recommend to the Congress that the United States commit itself to provide its [air share of the Fund on a matching basis over the first 5 years.

This level of support would provide start-up assistance under mutually agreed upon terms. As these programs get underway, it may well be that the member nations will decide that additional resources are required. I invite other nations to join with us in this commitment to meaningful action.

CONTROL OF MARINE POLLUTION

Ocean pollution is clearly one of our major international environmental problems. I am gratified that in the past year the Congress has taken several steps to reduce the risks of oil spills on the high seas. However, further congressional action is needed to ratify several pending international conventions and to adopt implementing legislation for the various oil-spill conventions which have been ratified or which are awaiting approval.

Action on these recommendations will complete the first round of international conventions to deal with marine pollution. We have taken initiatives in three international forums to develop a second and more sophisticated round of agreements in this area. We are preparing for a 1973 Intergovernmental Maritime Consultative Organization (IMCO) Conference to draft a convention barring intentional discharges to the sea of oil and hazardous substances from ships. In conjunction with the Law of the Sea Conference scheduled for 1973, we are examining

measures to control the effects of developing undersea resources. And, in the preparatory work for the 1972 U.N. Conference on the Human Environment, progress has been made on an agreement to regulate the ocean dumping of shore-generated wastes, and further work in this area has been scheduled by IMCO. We hope to conclude conventions in each of these areas by 1973.

PROTECTING CHILDREN FROM LEAD BASED PAINT

To many Americans, "environment" means the city streets where they live and work. It is here that a localized but acutely dangerous type of "pollution" has appeared and stirred mounting public concern.

The victims are children: the hazard is lead-based paint. Such paint was applied to the walls of most dwellings prior to the 1950's. When the paint chips and peels from the walls in dilapidated housing, it is frequently eaten by small children. This sometimes results in lead poisoning which can cause permanent mental retardation and occasionally death. We can and must prevent unnecessary loss of life and health from this hazard, which particularly afflicts the poorest segments of our population.

To help meet the lead-paint threat, the Department of Health, Education, and Welfare will administer grants and technical assistance to initiate programs in over 50 communities to test children in highrisk areas for lead concentrations. In addition, these programs will support the development of community organization and public education to increase public awareness of this hazard. Other Federal agencies are also active in the effort to combat lead-based paint poisoning. ACTION and other volunteers will assist city governments to help alleviate lead paint hazards. The Department of Housing and Urban Development is engaged in research and other actions to detect and eliminate this hazard.

The resources of the private sector should also be utilized through local laws requiring owners of housing wherever possible to control lead paint hazards.

ENLISTING THE YOUNG

The starting point of environmental quality is in the hearts and minds of the people. Unless the people have a deep commitment to the new values and a clear understanding of the new problems, all our laws and programs and spending will avail little. The young, quick to commit and used to learning, are gaining the changed outlook fastest of all. Their enthusiasm about the environment spreads with a healthy contagion: their energy in its behalf can be an impressive force for good.

Four youth participation programs of mutual benefit to the young and the Nation are now planned or underway:

Last October, I initiated the Environmental Merit Awards Program. This program, directed by the Environmental Protection Agency in cooperation with the U.S. Office of Education, awards national recognition to successful student projects leading to environmental understanding or improvement. Qualifications for the awards are determined by a local board consisting of secondary school students, faculty, and representatives of the local community. Already more than 2,000 high schools, representing all 50 States, have registered in the program.

The Department of Agriculture's expanded field scout demonstration program, designed to permit more effective pest control with less reliance on chemical pesticides, will employ thousands of high school and college students. These young people will be scouting cotton and tobacco pests in the coming growing season, and the program will be expanded to other crops in future years.

The Environmental Protection Agency has recently initiated in its Seattle regional office a pilot program using young people to assist the agency in many of its important tasks, including monitoring. EPA is working with State and local pollution control agencies to identify monitoring needs. ACTION and the youth training programs are providing the manpower. If this initial program proves successful, the concept will be expanded.

ACTION volunteers and young people employed through the Neighborhood Youth Corps, Job Corps, and college work-study programs will work with city governments to help alleviate lead paint hazards, gaining experience in community health work as they give urgently needed aid to inner-city families.

Young people working on environmental projects, learning the skills necessary for a particular job, must also understand how their work relates to the environmental process as a whole. Thus, all of these activities must be supplemented by continued improvement in many aspects of environmental education to help all of our citizens, both young and old, develop a better awareness of man's relation to his environment. In my first Environmental Quality Report, I stressed the importance of improving the Nation's "environmental literacy." This goal remains as important as ever, and our progress toward it must continue.

ONE DESTINY

Our destiny is one: this the environmental awakening has taught America in these first years of the seventies. Let us never forget, though, that it is not a destiny of fear, but of promise. As I stated last August in transmitting the Second Annual Report of the Council on Environmental Quality: "The work of environmental improvement is a task for all our people. . . . The achievement of that goal will challenge the creativity of our science and technology, the enterprise and adaptability of our industry, the responsiveness and sense of balance of our political and legal institutions, and the resourcefulness and the capacity of this country to honor those human values upon which the quality of our national life must ultimately depend." We shall rise to the challenge of solving our environmental problems by enlisting the creative energy of all of our citizens in a cause truly worthy of the best that each can bring to it.

While we share our environmental problems with all the people of the world, our industrial might, which has made us the leader among nations in terms of material well-being, also gives us the responsibility of dealing with environmental problems first among the nations. We can be proud that our solutions and our performance will become the measure for others climbing the ladder of aspirations and difficulties; we can set our sights on a standard that will lift their expectations of what man can do.

The pursuit of environmental quality will require courage and patience. Problems that have been building over many years will not yield to facile solutions. But I do not doubt that Americans have the wit and the will to win--to fulfill our brightest vision of what the future can be.

Memorandum From the President on Integrated Pest Management

August 2, 1979

Memorandum for the Secretary of Agriculture, the Secretary of Commerce, the Secretary of Defense, the Secretary of Health, Education & Welfare, the Secretary of Housing and Urban Development, the Secretary of the Interior, the Secretary of Labor, the Secretary of Transportation, the Administrator of the Environmental Protection Agency, the Administrator of the General Services Administration, the Chairman of the Council on Environmental Quality

In my Environmental Message of August 2, 1979, I recognized that integrated pest management (IPM) has both economic and environmental benefits and should be encouraged in both research and operational programs of federal agencies. Therefore, I am directing that each of your agencies:

- Modify as soon as possible your existing pest management, research, control, education, and assistance programs to support and adopt IPM strategies wherever practicable within the limits of existing resources.
- Review your pest management research, control, education, and assistance programs to assess the potential for increased emphasis on integrated pest management.
- Report actions taken to implement IPM strategies and the results of this review and assessment to the IPM coordinating committee in six months.

I am establishing an interagency IPM Coordinating Committee to assure implementation of this directive and to oversee further development and implementation of integrated pest management practices. The Committee shall be chaired by the Council on Environmental Quality. Your agency should appoint one representative to serve on this Committee who is an Assistant Secretary, Assistant Administrator, or the equivalent. The Committee is to report to me by June 30, 1980 on progress made by federal agencies in the advancement of IPM and on any institutional barriers thereto.

The Committee may request any Executive agency to furnish such information, advice, and service as may be useful for the fulfillment of the Committee's functions. Each of your agencies shall cooperate with and furnish support to the Committee as needed to carry out its functions.

Please give these assignments your immediate attention.

JIMMY CARTER

History of the UC IPM Program

Annual reports (<http://www.ipm.ucanr.edu/IPMPROJECT/annualreports.html>) | **Strategic plan** (<http://www.ipm.ucanr.edu/IPMPROJECT/strategy.html>)

Program review (<http://www.ipm.ucanr.edu/IPMPROJECT/programreview.html>)

Building on a growing movement within and outside the University to promote integrated pest management research and extension, in 1979 the California Legislature funded the University of California to establish the Statewide IPM Program.

This history of the UC IPM Program, written by Jim Lyons (director or acting director of the program on four distinct occasions), details the setting in which the idea for an IPM program arose, describes how the program developed, and chronicles major milestones. It takes the program through mid-2003.

Value Notes

▲ This geographic level of poverty and health estimates is not comparable to other geographic levels of these estimates

Some estimates presented here come from sample data, and thus have sampling errors that may render some apparent differences between geographies statistically indistinguishable. Click the QI left of each row in TABLE view to learn about sampling error.

The vintage year (e.g., V2017) refers to the final year of the series (2010 thru 2017). *Different vintage years of estimates are not comparable.*

Fact Notes

- (a) Includes persons reporting only one race
- (b) Hispanics may be of any race, so also are included in applicable race categories
- (c) Economic Census - Puerto Rico data are not comparable to U.S. Economic Census data

Value Flags

- Either no or too few sample observations were available to compute an estimate, or a ratio of medians cannot be calculated because one or both of the median estimates falls in the interval of an open ended distribution.
- D Suppressed to avoid disclosure of confidential information
- F Fewer than 25 firms
- FN Footnote on this item in place of data
- NA Not available
- S Suppressed; does not meet publication standards
- X Not applicable
- Z Value greater than zero but less than half unit of measure shown

QuickFacts data are derived from: Population Estimates, American Community Survey, Census of Population and Housing, Current Population Survey, Small Area Health Insurance Estimates, Small Area Poverty Estimates, State and County Housing Unit Estimates, County Business Patterns, Nonemployer Statistics, Economic Census, Survey of Business Owners, Building Permits.

Introduction

1.1 Overview

This Construction Site Best Management Practices (CSBMP) Manual (Manual) provides guidance on the selection and implementation of Best Management Practices (BMPs) into construction projects within the Caltrans right-of-way.

The primary objective of this CSBMP Manual is to provide the overall process for selecting, installing, and maintaining temporary BMPs in Caltrans construction projects. The CSBMP Manual provides a general background of stormwater documents and references to other stormwater manuals, includes a flowchart showing applicable BMP triggers for each of the six Construction Site BMP categories, and detailed guidance for the selection, installation, and required maintenance for individual BMPs. The Manual ties into the Caltrans 2015 Standard Specifications applicable to BMP installation and maintenance frequency,

This Manual is organized as follows:

- **Section 1 – Introduction** provides a background on regulations and stormwater permits, and relevant stormwater guidance documents and websites.
- **Section 2 – Caltrans Construction Stormwater Program Requirements** provides a description of general documents prepared for or related to the construction phase of the project, instructions for the selection and implementation of Construction Site BMPs and details the minimum BMP inspections required for construction sites.
- **Section 3 – Temporary Soil Stabilization BMPs** provides an overview of the Soil Stabilization BMP category and a listing and working details for Caltrans Construction Site BMPs for Temporary Soil Stabilization.
- **Section 4 – Temporary Sediment Control BMPs** provides an overview of the Sediment Control BMP category and a listing and working details for Caltrans Construction Site BMPs for Temporary Sediment Control.
- **Section 5 - Wind Erosion Control BMPs** provides an overview of the Wind Erosion BMP category and a listing and working details for Caltrans Construction Site BMPs for Wind Erosion Control.
- **Section 6 - Tracking Control BMPs** provides an overview of the Tracking Control BMP category and a listing and working details for Caltrans Construction Site BMPs for Tracking Control.
- **Section 7 - Non-Stormwater Management BMPs** provides an overview of the Non- Stormwater Management BMP category and a listing and working details for Caltrans Construction Site BMPs for Non-Stormwater Management.
- **Section 8 - Waste Management and Material Pollution Control BMPs** provides an overview of the Waste Management and Materials Pollution Control BMP category and a listing and working details for Caltrans Construction Site BMPs for Waste Management and Materials Pollution Control.
- **Appendix A** – provides definitions of terms used throughout this Manual.
- **Appendix B** – provides guidance on the selection of temporary soil stabilization controls.
- **Appendix C** – provides guidance on the requirements for the implementation of Active Treatment System (ATS) to comply with the CGP or the LTCGP.

1.2 Regulations and Stormwater Permits

1.2.1 Federal Regulations

The Clean Water Act is a Federal regulation that deals in part with controlling discharges of pollutants from Municipal Separate Storm Sewer Systems (MS4s), construction sites, and industrial activities as part of the National Pollutant Discharge Elimination System (NPDES) permit process. In 1990, the Environmental Protection Agency (EPA) promulgated federal stormwater regulations requiring municipal, construction and industrial stormwater discharges to comply with an NPDES permit.

In California, the EPA delegated its authority to issue NPDES permits to the State Water Resources Control Board (SWRCB). The State Board has nine regional water quality control boards across the State. Figure 1-1 presents a depiction of the nine regional board boundaries in relation to the Caltrans Districts.

1.2.2 Caltrans NPDES Statewide Permit and NPDES Construction General Permits

On July 15, 1999, the SWRCB issued the first “NPDES Permit, Statewide Stormwater Permit and Waste Discharge Requirements (WDRs) for the State of California, Department of Transportation (Caltrans)” (NPDES No. CAS000003) hereby called “Caltrans Permit.” The Caltrans Permit requires the preparation and implementation of the Caltrans Statewide Stormwater Management Plan (SWMP). The SWMP describes how Caltrans plans to implement the Caltrans Permit requirements and describes Caltrans’ program addressing stormwater pollution control related to various activities, including planning, design, construction, maintenance, and operation of roadways and facilities.

The Caltrans Permit regulates stormwater discharges from Caltrans properties, facilities, and activities, and requires that Caltrans’ construction program comply with the requirements of the “NPDES General Permit, WDRs for Discharges of Stormwater Runoff Associated with Construction Activity” (NPDES No. CAS000002) (Construction General Permit) issued by the SWRCB.

Both the Caltrans Permit and the Construction General Permit (CGP) have been reissued since 2009. The current Caltrans Permit Order 2012-0011-DWQ became effective July 1, 2013 and requires construction projects with one acre or more of soil disturbance to comply with the CGP Order 2009-009-DWQ and amendments thereto. There are a small number of Caltrans projects that are situated in the Lake Tahoe Regional Board area; those projects are subject to the Lake Tahoe Construction General Permit (LTCGP) Order No.R6T-1016-0010. The CGP and the LTCGP require SWPPP projects to upload the authorized SWPPP and all other relevant documents and data to the State Board’s Stormwater Multiple Application and Report Tracking System (SMARTS).

1.2.3 Other NPDES Permits

There are other Permits that might be applicable to Caltrans construction projects depending on the specific activities. Any construction project might trigger the Statewide Industrial Permit coverage if there is a proposed batch plant or other industrial activities as outlined below. In addition, if there is any dewatering being proposed, there are specific Regional Permits that might be applicable.

1.2.3.1 Industrial Permit

Industrial Activities are not covered under the Caltrans Permit. The Statewide Permit for Stormwater Discharges Associated with Industrial Activities (IGP) (Order 2014-0057-DWQ) regulates nine broad categories of industrial activities. There are certain activities that might occur ancillary to construction projects; for those operations, the industrial permit is triggered. Caltrans contracts include language requiring the Contractor to implement BMPs and seek coverage as required under the IGP.

1.2.3.2 Dewatering Permit

Dewatering discharge requirements vary among the nine regional boards. Caltrans has developed a Dewatering Manual that should be referred to determine appropriate requirements for the individual construction site. The Dewatering Manual can be accessed via the website link included in Table 1-4.

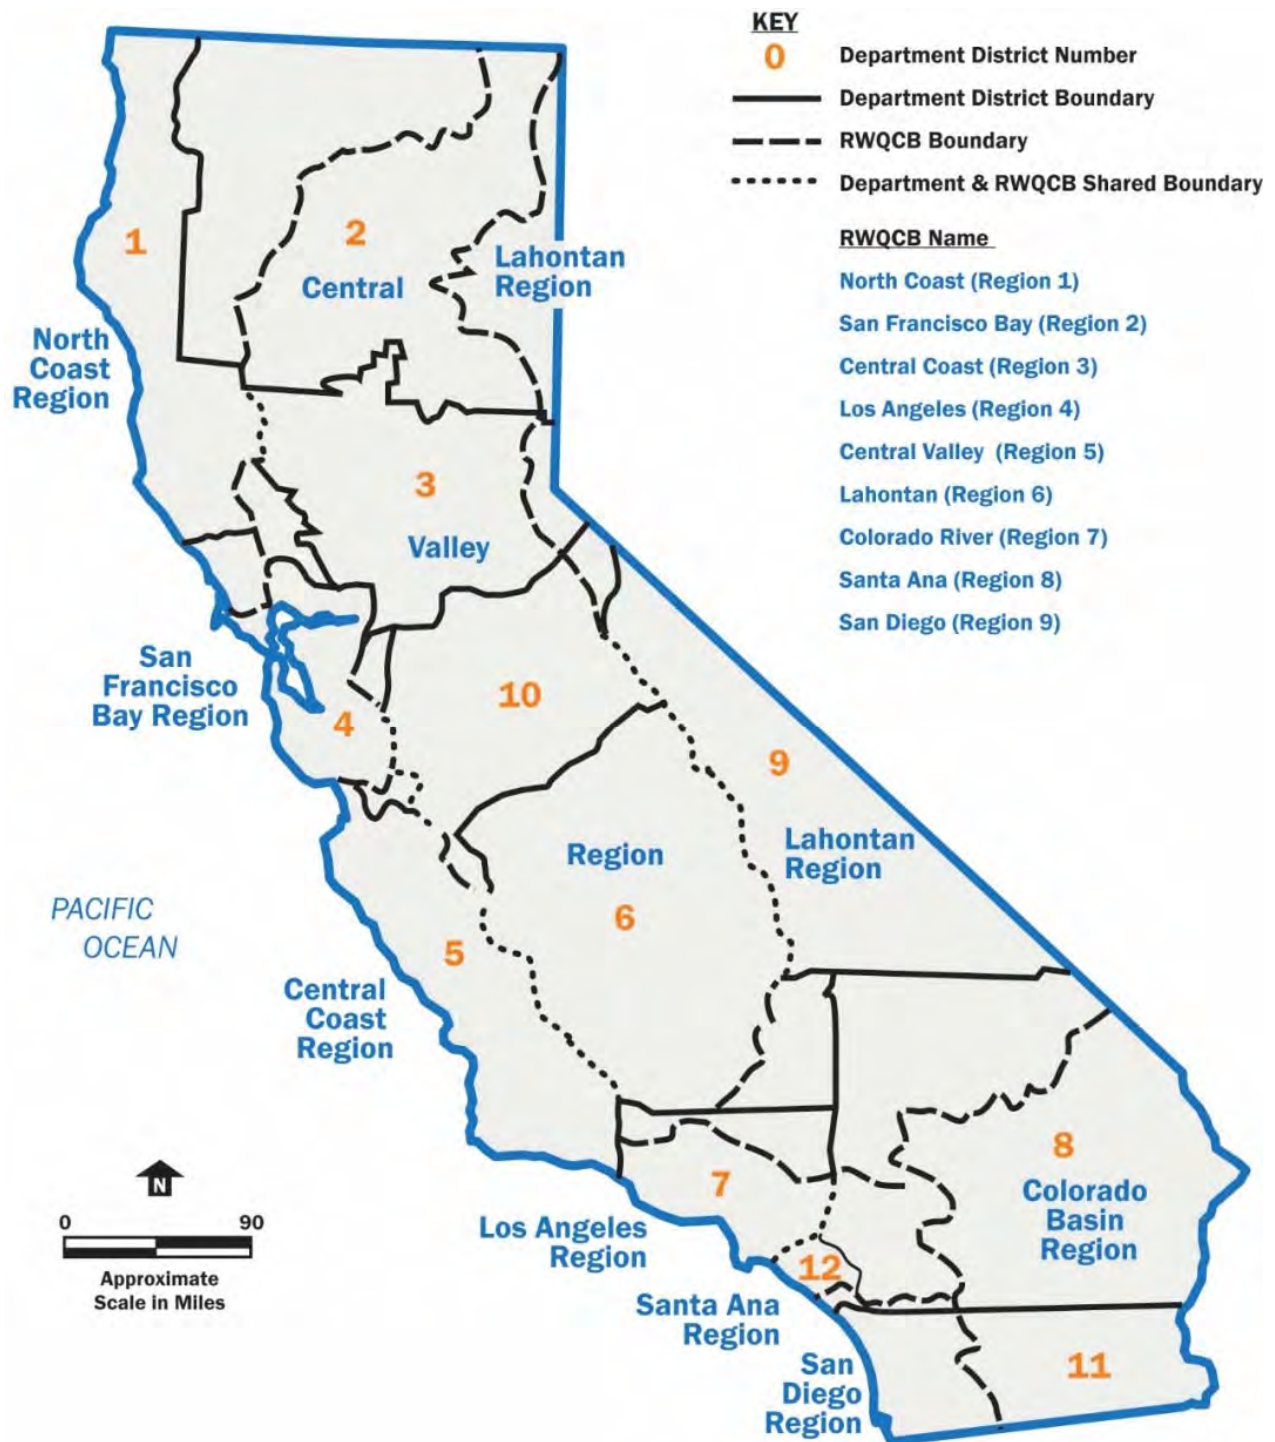

Figure 1-1. Map of California with Regional Water Quality Control Boards and Caltrans Districts

1.3 Caltrans Stormwater Manuals and Websites

Caltrans has devised a comprehensive stormwater program to comply with Caltrans Permit requirements. In addition to the 2016 SWMP, Caltrans has developed several stormwater guidance manuals that are available on their website for staff, consultants and anyone in the public to use to implement appropriate BMPs.

Table 1-3 presents a list of the primary reference material to be used for determining applicable permit requirements and specific compliance mechanisms developed by Caltrans. This Manual is intended to be used in conjunction with the SWPPP/WPCP Preparation Manual as both are directly related to water pollution control when performing construction operations within Caltrans projects and/or rights of way.

Table 1-3. Relevant Caltrans Stormwater Documents, Manuals and their Purpose¹

Date	Document	Purpose
July 2016	Caltrans Stormwater Management Plan (SWMP)	Describes how Caltrans plans to implement the Caltrans Permit requirements. The SWMP describes Caltrans' program and addresses stormwater pollution control related to various activities, including planning, design, construction, maintenance, and operation of roadways and facilities.
February 2016	Stormwater Quality Handbooks: Project Planning and Design Guide (PPDG)	Guides project planning staff in preparing and selecting appropriate Best Management Practices for inclusion into Contract Plans. Includes step-by-step guidance for documenting the selection and implementation of BMPs.
	Appendix E - Stormwater Data Report (SWDR)	Document prepared by the Project Engineer or Landscape Architect which forms basis for ensuring compliance with the Caltrans Permit requirements for the Design Division. Determination of SWPPP/WPCP applicability based on DSA and BMP line items included as part of the Contract Plans.
June 2016	Stormwater Pollution Prevention Plan (SWPPP) and Water Pollution Control Program (WPCP) Preparation Manual	Guides Contractors and Caltrans staff through the process of preparing a SWPPP and WPCP. This manual provides detailed step-by-step procedures, instructions, sample text and a template that Contractors must use to prepare the SWPPP/WPCP. Templates conform to CGP requirements based on risk level, LTCGP requirements including deviations from CGP language, and Caltrans requirements for preparing WPCPs.
August 2013	Construction Site Monitoring Program Guidance Manual	This manual presents guidance for Caltrans staff and Contractors to use in the planning and implementation of stormwater monitoring programs at construction sites. Describes and provides guidance on developing Sampling and Analysis Plans, standard operating procedures for pH and turbidity sampling and other requirements of the CGP and LTCGP.
July 2003	Guidance for Temporary Soil Stabilization	The main purpose of this document is to help direct the planning, selection, and implementation of Caltrans-approved temporary soil stabilization BMPs.
July 2014	Field Guide to Construction Site Dewatering	The purpose of this Dewatering Guide is to inform and guide intended users in selecting, implementing, and monitoring construction site dewatering operations.
September 2008	Erosion Prediction Procedure Manual	Describes the method established and approved by headquarters (HQ) Office of Hydraulics and Stormwater Design (OHSD) for the prediction of erosion rates before, during, and after construction of Caltrans projects to meet the erosion and sediment control requirements identified in the Caltrans Permit, the CGP and the LTCGP.

Table 1-4 presents website links for Caltrans Manuals, procedures and other documents along with other websites that can be used to either gain a deeper understanding of stormwater requirements or as

¹ There may be other relevant Manuals that pertain to specific enforcement or general criteria, see Table 1-4 for additional Manuals and links

guidance when preparing stormwater documents and selecting appropriate temporary construction site BMPs.

Section 2

Caltrans Construction Stormwater Management Program Requirements

2.1 Stormwater Pollution Prevention Plan and Water Pollution Control Program

Caltrans requires Contractors to prepare and implement a program to effectively control water pollution during the construction of all projects (see Standard Specification Section 13 Water Pollution Control). Projects resulting in one acre or more of disturbed soil area (DSA) are subject to the CGP or the LTCGP depending on the project location. Caltrans Standard Specifications require that for these projects, Contractors prepare and submit a SWPPP.

If two or more small projects [less than one acre of soil disturbance] in the same corridor are part of a larger common plan of development [one acre or more], then these small projects are also subject to the requirements of the CGP or the LTCGP to develop and implement a SWPPP. There also might be instances where a SWPPP is required even when there is less than one acre of DSA, if it is determined that the project poses a significant water quality risk; this determination will be made by the District/Regional NPDES Coordinator or the Construction Stormwater Coordinator or if mandated by the RWQCB or SWRCB or another regulatory agency. Potential examples when this might occur could be work over a 303d waterbody, water implosions, etc.

Caltrans requires that a WPCP addressing control measures be prepared and implemented by the construction Contractor for projects resulting in soil disturbance of less than one acre. The specific requirements and detailed instructions are included in Section 4 of the SWPPP/WPCP Preparation Manual. These general requirements are included in the Construction BMP Applicability Flowchart, Figure 2-1 of this Manual.

Projects that have a DSA between one and less than five acres may qualify for a rainfall erosivity waiver under the CGP if the rainfall erosivity factor (R factor) is less than a value of five. The R factor takes into account project location, length of construction period, and time of year so projects that begin and complete construction within a short period are likely to qualify for a rainfall erosivity waiver. To calculate the R value, refer to Section 1.4.2.1 of the SWPPP/WPCP Preparation Manual, a link to the manual is provided in Table 1-4.

Projects that qualify for a rainfall erosivity waiver do not need to prepare a SWPPP but are required to submit proper documentation via SMARTS (to be exempted from the CGP) as well as prepare and implement a site-specific Water Pollution Control Program (WPCP).

2.2 Construction BMP Applicability

The flowchart presented in Figure 2-1 guides the user as to whether the project triggers a SWPPP or a WPCP and where to find additional information, if needed. The flowchart also includes general questions to determine applicability of BMP categories that are described in Sections 3-8 of this Manual.

The steps described below correspond to the steps shown in Figure 2-1.

Step 1 - Start

The Contractor, the Water Pollution Control (WPC) Manager, the Qualified SWPPP Developer (QSD) or the Qualified SWPPP Practitioner (QSP) should use Figure 2-1, the guidance provided in this section, and the SWPPP/WPCP Preparation Manual to determine the project's entire BMP selection and applicability for the duration of the construction phase.

Step 2 - Is a Construction project being proposed?

A construction project is defined as any activity, including, but not limited to, clearing, grading, grubbing, or excavation. Routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of the facility is not deemed a construction activity that requires a SWPPP or a WPCP.

If the project qualifies as a construction project, proceed to step 3.

If the project does not meet the definition of construction, then the project is subject to Maintenance BMPs, refer to the Caltrans July 2016 SWMP or the Caltrans Maintenance Staff Guide.

Step 3 - Will the project create one acre or more of Disturbed Soil Area?

If the construction project will disturb more than one acre of soil, it is subject to either the CGP or the LTCGP depending on its location and must prepare and maintain an up to date SWPPP during the entire duration of the project.

If the project disturbs less than an acre of soil, the project must have a WPCP prepared and implemented, see Section 4 of the SWPPP/WPCP Preparation Manual for specific instructions.

Step 4 - Can the construction project qualify for a Rainfall Erosivity Waiver?

If a project will be a short duration and is more than one acre but less than five acres of soil disturbance, it might qualify for an EPA rainfall erosivity waiver as discussed in Section 1.4.2 of the SWPPP/WPCP Preparation Manual.

If you answered yes, the project does not need coverage under the CGP but it still requires some paperwork to be filed via SMARTS. In addition, a WPCP must be prepared and implemented.

If you answered no, then project is subject to SWPPP requirements. See Section 3 of the SWPPP/WPCP Preparation Manual for further guidance on preparing a SWPPP.

Step 5 - Are any soil areas expected to be exposed and need stabilization as part of the project or is there a need to stabilize concentrated flow conveyances?

Any project subject to CGP or LTCGP is required to implement appropriate controls year-round. If the project has exposed soil areas or unlined conveyances, the WPC Manager or QSP must be diligent in ensuring appropriate BMPs are implemented. See Section 3 of this Manual for specific BMP factsheets and proceed to Step 6. For further guidance on proper selection and costs, see Appendix B of this Manual.

If there are no soil areas needing stabilization and no unstable conveyances, then proceed to Step 6.

Step 6 - Will the project require temporary controls to intercept/slowdown onsite or offsite flows?

If the project has areas where offsite flows are coming onto the project area, flows must be conveyed and the WPC Manager or QSP must ensure that no materials or contaminants including soil are being carried by the offsite flows. Onsite flows must be conveyed via lined or vegetated channels to reduce potential for turbid flows. See Section 4 of this Manual for specific BMP factsheets to control sediment-laden runoff.

Step 7 - Will the project require a dust control plan or is there a potential for dust control BMPs to be applicable?

Utilize Section 5 of this Manual for specific BMP factsheets if the contract documents require the preparation and implementation of a Dust Control Plan or if there is a potential for dust to be generated at any time during the duration of the construction project.

Step 8 - Will the project require tracking controls in any area within project limits?

Any areas where construction vehicles are entering or exiting the project must be stabilized to prevent tracking of sediment or other materials. See Section 6 of this Manual for specific BMP factsheets for tracking control. Additionally, SC-7, Street Sweeping should be evaluated and implemented either standalone or in combination to ensure compliance with all permits and contract documents.

Step 9 - Will the project day to day operations require good housekeeping practices or have a need for non-stormwater BMPs?

Section 7 of this Manual includes a list of source control BMPs that prevent pollution by limiting or reducing potential pollutants at their source before they come in contact with stormwater.

Step 10 - Will the project include storage of materials, spill prevention needs, waste management or other housekeeping practices?

All materials or wastes either stored or generated during the construction phase must be properly stored and disposed of. Section 8 of this Manual includes lists of BMPs that must be utilized at the Contractor's yard, where the materials are stored, or where construction activities are being conducted to ensure proper usage, containment, and disposal of materials and waste products.

END - Specific BMP factsheets should be reviewed and the Project's SWPPP or WPCP text and tables along with the Water Pollution Control Drawings (WPCDs) should be modified to ensure appropriate controls are implemented year-round

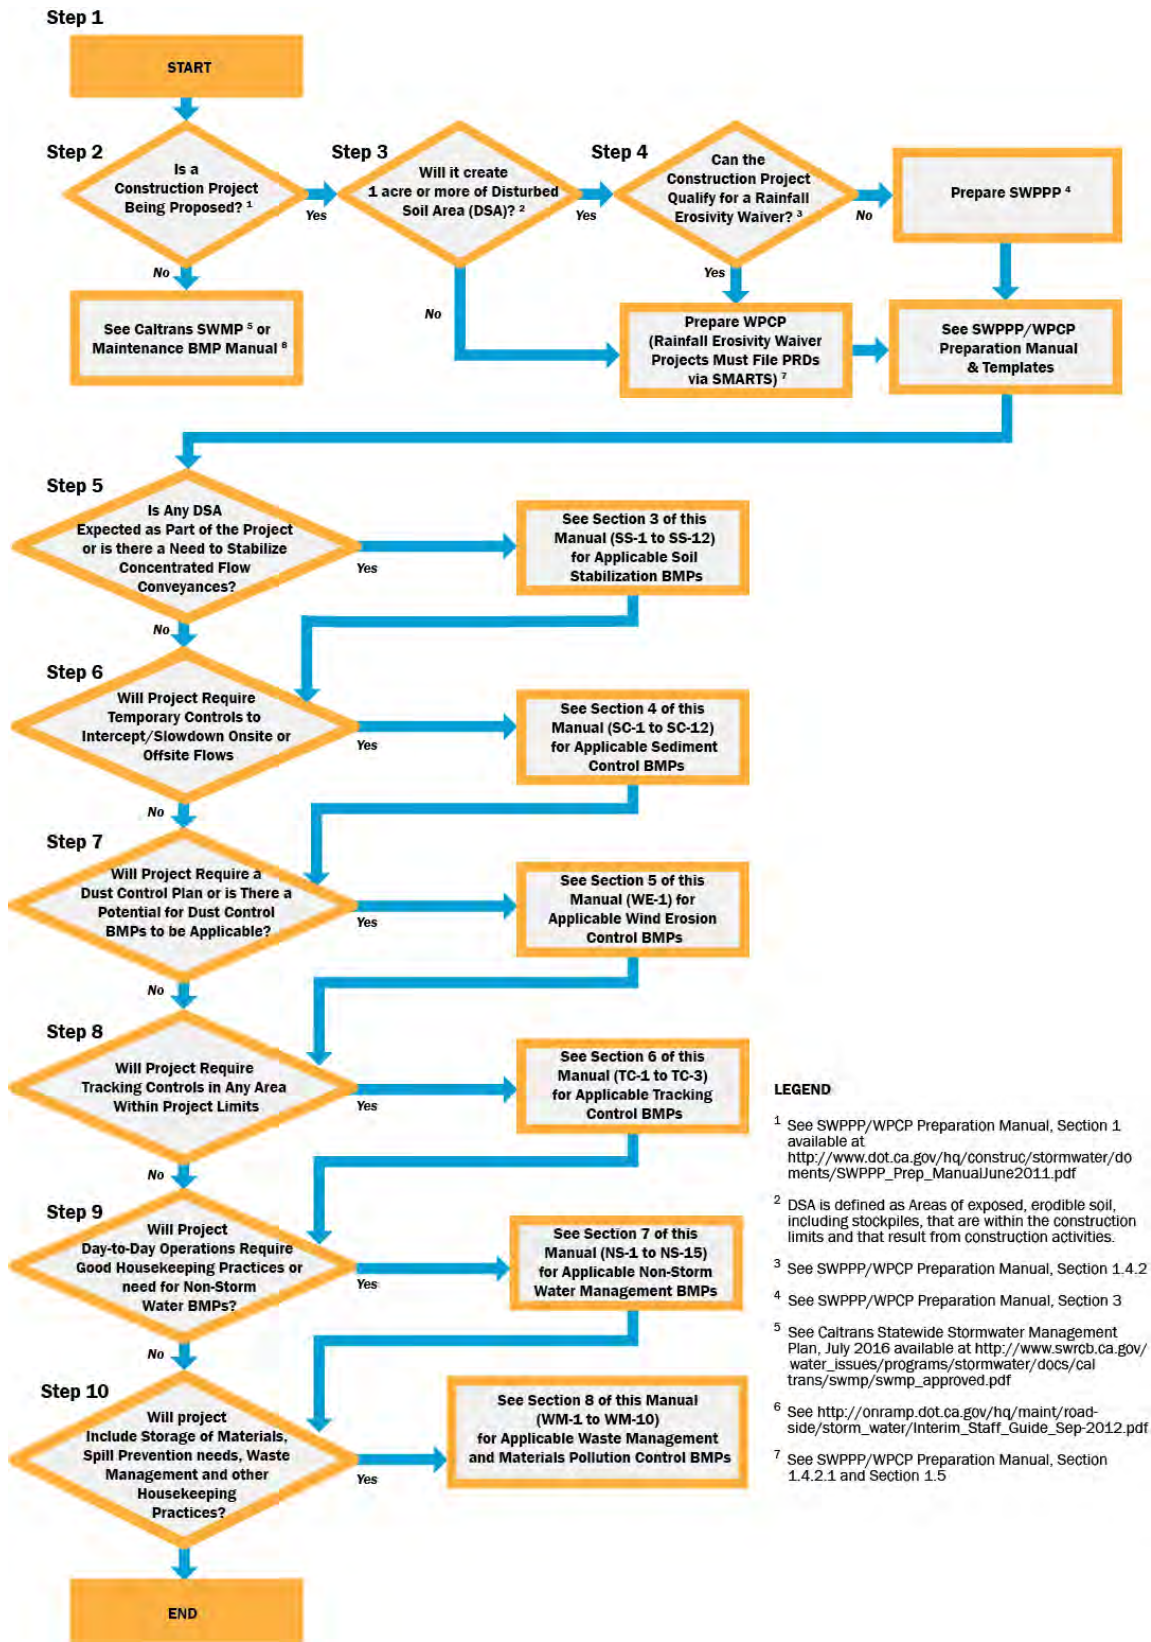

Figure 2-2. Construction Site BMP Applicability Flowchart

2.3 Minimum Construction BMPs

This section provides the minimum construction BMPs required for a project subject to the CGP or the LTCGP or one that requires the preparation and implementation of a WPCP. It is important to note that the requirements of this Section are minimum requirements, and that Caltrans contracts may impose more stringent requirements. Working details of Construction Site BMPs are presented in Sections 3 through 8 of this Manual.

Construction Site BMPs (also sometimes called temporary control practices or BMPs) are best conventional technology/best available technology (BCT/BAT)-based BMPs that are consistent with the BMPs and control practices required under the CGP and the LTCGP. Caltrans Construction Site BMPs are divided into six categories as shown in Table 2-1.

Stormwater pollution control requirements are intended to be implemented on a year-round basis at an appropriate level. The requirements must be implemented in a proactive manner during all seasons while construction is ongoing. Appropriate water pollution control includes the implementation of an effective combination of both soil stabilization and sediment controls, implementation of wind erosion, tracking controls, non-stormwater and waste management, and material pollution BMPs. Some BMPs can be implemented as a stand-alone device while others can be combined to improve effectiveness and compliance.

Section 2 of the SWPPP/WPCP Preparation Manual describes in detail specific requirements under the applicable CGP. The CGP and LTCGP both require minimum controls and require BMPs based on the projects' calculated risk level to apply linear sediment controls along the toe of the slope, face of the slope, and at the grade breaks of exposed slopes to comply with sheet flow lengths.

¹ Can be selected as a standalone BMP or a combination of temporary soil stabilization BMPs is selected depending on site conditions, minimum requirement is met when the individual BMP or the combination is properly implemented.

² Only applicable when outlet protection/velocity dissipation is required.

³ When dewatering is expected, must have a dewatering and/or diversion plan as required under LTCGP Section N.

2.4 BMP Inspection Frequency

The SWPPP or WPCP implemented on Caltrans construction projects includes specific visual monitoring requirements to comply with the CGP, LTCGP, and/or Caltrans Permit. All BMPs deployed on construction sites must be inspected on a frequency as described below. Improperly installed or damaged BMPs must be corrected immediately, or by a later date and time if requested by the Contractor and approved by the Resident Engineer (RE) in writing. Corrections must be made before the onset of forecasted rain events. Inspections of Construction Site BMPs are to be conducted at a minimum as follows:

- Prior to a forecast storm event
- After a qualified rain event that causes runoff from the construction site
- At 24-hour intervals during extended rain events
- Weekly throughout the duration of the construction project

Table 2-2 shows the monitoring requirements for projects subject to CGP or LTCGP. The SWPPP/WPCP Preparation Manual includes more details on what each inspection should include.

Section 3

Temporary Soil Stabilization BMP

3.1 Temporary Soil Stabilization

Temporary soil stabilization consists of preparing the soil surface and applying one of the BMPs shown in Table 3-1, or combination thereof, to disturbed soil areas. Temporary soil stabilization must be applied to disturbed soil areas of construction projects in conformance with contract documents and this Manual. Refer to Appendix B for additional guidance on the selection of temporary soil stabilization controls.

Tracking Control	<input checked="" type="checkbox"/>
Wind Erosion Control	<input checked="" type="checkbox"/>
Non-Stormwater Management	<input type="checkbox"/>
Materials and Waste Management	<input type="checkbox"/>

Definition and Purpose

This BMP involves developing, for every project, a schedule that includes sequencing of construction activities with the implementation of construction site BMPs such as temporary soil stabilization and temporary sediment control measures. The purpose is to reduce the amount and duration of soil exposed to erosion by wind, rain, runoff, and vehicle tracking, and to perform the construction activities and control practices in accordance with the planned schedule.

Appropriate Applications

Construction sequencing should be scheduled to minimize land disturbance during the wetter months for all projects. In addition, any construction windows required by regulatory permits, and any winter suspension work should be described in the schedule. Appropriate BMPs must be implemented year-round.

Limitations

Environmental constraints such as nesting season prohibitions reduce the full capabilities of this BMP.

Standards and Specifications

General Requirements

- Developing a schedule and planning the project operations to minimize erosion and the potential to discharge pollutants to stormwater are the very first steps in an effective stormwater program. The construction schedule must be incorporated into the SWPPP or WPCP. Refer to Section 8 and 13 of the Standard Specifications.

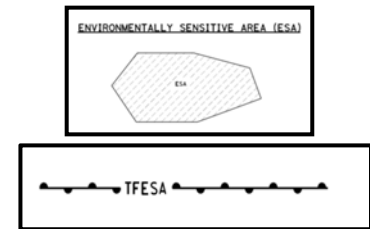

- The schedule should clearly show when work activities that could pollute stormwater with sediment or other contaminants would occur (e.g., grading, move-in, move-out, stockpiling, pile driving), and when soil stabilization, sediment control, and other BMPs associated with each phase of construction would be implemented.
- The schedule should include details on the implementation and deployment of:
 - Temporary and permanent soil stabilization BMPs
 - Temporary sediment control BMPs
 - Tracking control BMPs
 - Wind erosion control BMPs
 - Non-stormwater BMPs and
 - Waste management and materials pollution control BMPs
- The schedule should also include dates for significant long-term operations or activities that may have planned non-stormwater discharges such as dewatering, sawcutting, grinding, drilling, boring, crushing, blasting, painting, hydro-demolition, mortar mixing, bridge cleaning, etc.
- The construction schedule should reflect requirements for in-water work and other construction activity with potential to disturb water and biological resources contained in regulatory agency permits and approvals (RWQCB 401 WQC, USACE 404 permit, DFG 1602 permit, etc.).

Recommendations

- Schedule work to minimize soil disturbing activities during predicted rain events. Consider rescheduling activities for dry periods to minimize maintenance requirements.
- Develop the sequencing and timetable for the start and completion of each item such as site clearing and grubbing, grading, excavation, paving, pouring foundations, installing utilities, etc., to minimize the active construction area.
- Schedule major grading operations during dryer months when practical.
- Stabilize inactive areas within 15 days from the cessation of soil-disturbing activities or one day prior to the onset of precipitation, whichever occurs first. Must consider manufacturers recommendation for the selected soil stabilization BMP to ensure they meet the minimum dry time required. See Appendix B of this Manual for additional guidance.
- Monitor the weather forecast for storm events, which are storms that produce or are forecasted to produce at least 0.1 inch of precipitation within a 24-hour period. When rainfall is predicted, adjust the construction schedule to allow the implementation of soil stabilization, sediment controls, and, if applicable, sediment treatment controls on all disturbed areas prior to the onset of rain.

- Ensure ample supply of BMP materials are on site in order to quickly mobilize and implement required BMPs, particularly ahead of rain events when materials may be in short supply or back order.
 - Be prepared year-round to deploy soil stabilization and sediment control practices. Erosion may be caused during dry seasons by unseasonal rainfall, wind, and vehicle tracking. Keep the site stabilized year-round, and retain and maintain sediment trapping devices in operational condition.
 - Sequence trenching activities so that most open portions are closed before new trenching begins. Trenched material should be stored on the upstream side of the trenches.
 - Incorporate staged seeding and re-vegetation of graded slopes as work progresses.
 - Consider the early planting and establishment of permanent vegetation in the schedule to maximize plant establishment success and minimize irrigation and continuous maintenance needs.
 - Apply permanent erosion control to areas deemed substantially complete during the project's defined seeding window.
- Maintenance and Inspection
- Verify that work is progressing in accordance with the schedule. If progress deviates, take corrective actions.
 - Keep the schedule up to date and ensure it is consistent with the contractor's three-week look ahead, or other routine schedule submitted to the RE under the contract.
 - Amend the schedule when changes are warranted or when directed by the RE.
- SWPPP or WPCP
- A Water Pollution Control Schedule (WPCS) must include construction operations and BMP implementation for the entire duration of the project. The WPCS is to be included as an attachment and discussed in section 500.7 of the SWPPP or Section 30.5 of the WPCP.

- Definition and Purpose** Preservation of existing vegetation is the identification and protection of desirable vegetation that provides erosion and sediment control benefits.
- Appropriate Applications**
- Preserve existing vegetation at areas on a site where no construction activity is planned or will occur at a later date. This BMP is very applicable for multi-year or multiple location projects, where existing vegetation can be preserved until the area becomes active.
 - On a year-round basis, temporary fencing shall be provided prior to the commencement of clearing and grubbing operations or other soil-disturbing activities in areas.
 - Clearing and grubbing operations should be staged to preserve existing vegetation.
 - Areas where natural vegetation exists and is designated for preservation. Such areas often include steep slopes, watercourse, and building sites in wooded areas.
 - Areas where local, state, and federal government require preservation, such as vernal pools, wetlands, marshes, certain oak trees, etc.
 - Clearly marking and leaving a buffer area around these unique areas during construction will help to preserve these areas as well as take advantage of natural erosion prevention and sediment trapping.
 - During clearing and grubbing do not injure standing trees, plants, and improvements shown in the plans to be protected.
 - For any trenching or tunneling. Trenching shall be as far away from tree trunks as possible, usually outside of the tree drip line or canopy. Curve trenches around trees to avoid large roots or root concentrations. If roots are encountered, consider tunneling under them.

- When trenching and/or tunneling near or under trees to be retained, tunnels shall be at least 8 in below the ground surface, and not below the tree center to minimize impact on the roots. Tree roots shall not be left exposed to air; they shall be covered with soil as soon as possible, protected, and kept moistened with wet burlap or peat moss until the tunnel and/or trench can be completed.

- Limitations
- Protection of existing vegetation requires planning, and may limit the area available for construction activities.
 - For sites with diverse topography, it is often difficult and expensive to save existing trees while grading the site satisfactory for the construction project.

Standards and Specifications **General Requirements**

- Specifications for preservation of existing vegetation can be found in Standard Specifications Section 5-1.36A.
- Section 14 “Environmental Stewardship” of the Standard Specifications specifies the requirements related to environmental compliance and resource management, including requirements related to Environmentally Sensitive Areas (ESAs).
- Refer to Section 16-2.03 of the Standard Specifications for “High-Visibility Fences” used to delineate ESAs.
- Refer to 16-2.04 of the Standard Specifications for “Temporary Construction Mats” used to protect wetlands and other areas.

Schedule

- Preservation of existing vegetation must be provided prior to the commencement of clearing and grubbing operations or other soil-disturbing activities in areas identified on the plans to be preserved, including areas designated as ESAs.
- Preservation of existing vegetation should conform to scheduling requirements set forth in the special provisions.

Design and Layout

- Mark areas to be preserved with temporary fencing (Type ESA). The temporary fencing must be made of high visibility fabric secured with 6 foot (minimum) posts. Refer to Section 16-2.03B of the Standard Specifications for more information on temporary high-visibility fence materials.
- Fence posts can be either wood or steel, at the Contractor’s discretion, as appropriate for the intended purpose. The post spacing must be 8 feet center-to-center (maximum) and embedded at least 16 inches into the ground to completely support the fence in an upright position.
- See Standard Plan T65 for “Temporary Fence (Type ESA).”

Installation

- Construction materials, equipment storage, and parking areas should be located where they will not cause damage to vegetation designated for preservation. This could include: keeping equipment away from trees to prevent trunk and root damage, considering the impact of grade changes to existing vegetation

and the root zone, and minimizing disturbed areas by avoiding stands of trees and shrubs and following existing contours to reduce cutting and filling for temporary roads.

- Maintain existing irrigation systems.
 - Employees and subcontractors must be instructed to honor protective devices. No heavy equipment, vehicular traffic, or storage piles of any construction materials is permitted within the drip line of any tree to be retained. Removed trees should not be felled, pushed, or pulled into any retained trees. Fires should not be permitted within 100 ft of the drip line of any retained trees. Any fires must be of limited size, and must be kept under continual surveillance. No toxic or construction materials (including paint, acid, nails, gypsum board, chemicals, fuels, and lubricants) should be stored within 50 feet of the drip line of any retained trees, nor disposed of in any way which would injure vegetation.
 - After all other work is complete, fences and barriers must be removed last. This is because protected trees may be destroyed by carelessness during the final cleanup and landscaping.
- Maintenance and Inspection
- During the entire construction phase, the limits of disturbance must remain clearly marked to avoid damage to the existing vegetation during site cleanup and stabilization. Irrigation or maintenance of existing vegetation must conform to the requirements in the landscaping plan. If damage to protected trees still occurs, maintenance guidelines described below must be followed:
 - Serious tree injuries must be attended to by an arborist.
 - During construction, the District Environmental Branch must be contacted to ensure that ESAs are protected and any environmental regulations are followed.
 - Existing Vegetated Areas to be Preserved must be clearly demarcated in the WPCDs.
- SWPPP or WPCP
- Preservation of Existing Vegetation must be discussed in Section 500.3 of the SWPPP or Section 30.2 of the WPCP.

BMP Objectives	
Soil Stabilization	<input checked="" type="checkbox"/>
Sediment Control	<input type="checkbox"/>
Tracking Control	<input type="checkbox"/>
Wind Erosion Control	<input checked="" type="checkbox"/>
Non-Stormwater Management	<input type="checkbox"/>
Materials and Waste Management	<input type="checkbox"/>

- Definition and Purpose** Hydraulic mulch consists of applying a mixture of natural fibers and a stabilizing compound with hydroseeding equipment to temporarily protect exposed soil from erosion by raindrop impact or wind. This is one of five temporary soil stabilization alternatives to consider.
- Appropriate Applications**
- Hydraulic mulch is applied to disturbed areas requiring temporary protection until permanent vegetation is established, or disturbed areas that must be re-disturbed following an extended period of inactivity.
- Limitations**
- Wood fiber hydraulic mulches are generally short-lived (only last a part of a growing season) and require (24 hours or more) time to dry before rainfall occurs to be effective.
 - Paper mulches are not permitted.
 - Avoid use in areas where the mulch would be incompatible with immediate future earthwork activities and would have to be removed.
 - Cellulose fiber mulches alone may not perform well on steep slopes or in coarse soils.
- Standards and Specifications**
- General Requirements**
- See Standard Specifications Section 13-5.03D to 13-5.03G for placing various types of hydraulic mulch.
 - Standard Specifications Section 21-2.02D and 21-2.02E contain material specifications for fiber and tackifier, respectively.

- A certificate of compliance, as required under Standard Specifications Section 21-2.01C(4), is required for tackifier and bonded fiber matrix (BFM).
- Hydraulic matrices require time to dry before rainfall occurs to be effective. Refer to the manufacturer's specifications for drying times.
- Avoid mulch over-spray onto the traveled way, sidewalks, lined drainage channels, and existing vegetation.
- Selection of hydraulic mulches by the Contractor must be approved by a licensed professional.
- Prior to application, roughen embankment and fill areas by rolling with a crimping or punching type roller or by track walking. Track walking should only be used where other methods are impractical.

Temporary Hydraulic Mulch

- Temporary hydraulic mulch contains mixtures of fiber and tackifier that is applied to soil with hydraulic spray equipment.
- Fiber for temporary hydraulic mulch must be at least 50 percent wood fiber. The remaining percentage must be cellulose fiber, alternate fiber, or a combination of these fibers.
- Temporary hydraulic mulch application rates must follow the manufacturer's recommendations. If not provided, apply at a rate of 2,000 lb/ac.
- Tackifier should be applied per the manufacturer's instructions for the slope, soil, and wind conditions

Temporary BFM Hydraulic Mulch

- BFM contains 100% wood fiber and tackifier, sometimes combined with seed and fertilizer that is applied to soil hydraulically.
- BFM applications rates must follow the manufacturer's recommendations. If not provided, apply at a rate of 3,500 lb/ac.
- Tackifier used for BFM must be:
 - Bonded to the fiber or prepackaged with the fiber by the manufacturer
 - Contain a minimum of 10 percent of the combined weight of the dry fiber, activating agents, and additives
 - Organic, high viscosity colloidal polysaccharide with activating agents or a blended hydrocolloid-based binder

Temporary Cementitious Binder Hydraulic Mulch

- Temporary cementitious binder hydraulic mulch is a mixture of fiber and a cementitious binder that is applied to soil with hydraulic spray equipment.
- Application rates of temporary cementitious binder hydraulic mulch must be according to the manufacturer's specifications. If not provided, apply at a rate of 2,000 lb/ac and cementitious binder at 4,000 lb/ac.

Maintenance and Inspections

- Additional standards for cementitious binder are provided in Section 13-5.03G.
- Additional guidance on the selection of soil stabilization BMPs can be found in Appendix B of this Manual.
- A certificate of compliance under Standard Specifications Section 21-2.01C(4) for the applicable BMP must be submitted to the RE prior to application to ensure proper mix is being used.
- It is recommended that a small test area/mock-up occurs prior to large area application to verify sufficient cover for the approved mix.
- Maintain an unbroken, temporary mulched ground cover throughout the period of construction when the soils are not being reworked. Inspect before expected rain storms and repair any damaged ground cover and re-mulch exposed areas of bare soil.
- After any rainfall event, the Contractor is responsible for maintaining all slopes to prevent erosion.
- Areas where Hydraulic Mulch will be implemented must be shown in the WPCDs and match site conditions.
- Hydraulic Mulch, Temporary BFM Hydraulic Mulch or Temporary Cementitious Hydraulic Mulch must be discussed in Section 500.3 of the SWPPP or Section 30.2 of the WPCP.

BMP Objectives	
Soil Stabilization	<input type="checkbox"/>
Sediment Control	<input type="checkbox"/>
Tracking Control	<input type="checkbox"/>
Wind Erosion Control	<input checked="" type="checkbox"/>
Non-Stormwater Management	<input type="checkbox"/>
Materials and Waste Management	<input type="checkbox"/>

Definition and Purpose Hydroseeding typically consists of applying a mixture of wood, fiber, seed, fertilizer, and stabilizing emulsion with hydromulch equipment, which temporarily protects exposed soils from erosion by water and wind.

Appropriate Applications

- Hydroseeding is applied on disturbed soil areas requiring temporary protection until permanent vegetation is established or disturbed soil areas that must be re-disturbed following an extended period of inactivity.

- Can be used in conjunction with other rolled erosion control products.

Limitations

- Hydroseeding may be used alone only when there is sufficient time in the season to ensure adequate vegetation establishment and erosion control. Otherwise, hydroseeding must be used in conjunction with a soil binder or mulch, such as SS-5 “Soil Binders” and SS-6 “Straw Mulch.”

- Steep slopes are difficult to protect with temporary seeding.
- Temporary seeding may not be appropriate in dry periods without supplemental irrigation.
- Temporary vegetation may have to be removed before permanent vegetation is applied.
- Temporary vegetation is not appropriate for short-term inactivity.
- Hydroseeding should not be used in areas subject to heavy traffic.
- Could trigger non-visible sampling if the appropriate application timeframe (before a rain event) and manufacturer recommendations are not followed.

Standards and Specifications **General Requirements**

- Refer to Standard Specifications Section 13-5.03I “Temporary Hydroseed.”

- To select appropriate hydroseeding mixtures, an evaluation of site conditions shall be performed with respect to:
 - Soil conditions
 - Site topography
 - Season and climate
 - Vegetation types
 - Maintenance requirements
 - Sensitive adjacent areas
 - Water availability
 - Plans for permanent vegetation
- Selection of hydroseeding mixtures must be approved by the licensed professional.
- Seed mix must comply with Standard Specifications Section 21-2.02F “Seed,” and the project’s special provisions.
- Seed may be dry applied to small areas not accessible by hydroseeding equipment if authorized.
- Seeds must not contain seeds of prohibited noxious weeds and more than 1.0% total weed seed by weight. Seeds must be delivered to the project site with each species in separate, unopened containers with the seed tag attached. Measure individual seed species and mix in the presence of the RE.
- Fiber must be at least 50 percent wood fiber. The remaining percentage must be cellulose fiber, alternate fiber, or a combination of these fibers.
- Commercial fertilizer must conform to the requirements of the California Food and Agricultural Code. Fertilizer can be pelleted or granular form.

Application Procedures

- Prior to application, roughen the slope, fill area, or area to be seeded with the furrows trending along the contours. Rolling with a crimping or punching type roller or track walking is required on all slopes prior to hydroseeding. Track walking should only be used where other methods are impractical.
- Add water to hydroseed materials as recommended by the manufacturer and mix sufficiently to ensure an even application. A dispersing agent may be added to the mixture if authorized.
- Equipment must have a built-in continuous agitation and discharge system capable of producing a homogeneous mixture and a uniform application rate. The tank must have a minimum capacity of 1,000 gallons. A smaller tank can be used if authorized by the RE.
- Apply temporary hydroseed at the following rates:
 - Apply seed at rates specified in the project’s erosion control plans.
 - Apply fiber at 2,000 lb/ac.

Maintenance and Inspection

- Apply tackifier according to manufacturer’s recommendations for the slope, soil, and wind conditions.
- Apply materials in locations, rates, and number of applications shown and as follows:
- Start application within 60 minutes after adding seed to the tank.
- Apply in successive passes as necessary to achieve the specified application rate.
- Apply all hydroseed materials shown for a single area within 72 hours.
- If hydroseed materials are applied to areas covered by Rolled Erosion Control Products (RECP), apply hydroseed materials to the RECP as follows:
 - Verify the RECP is in uniform contact with the slope surface.
 - Spray materials into the RECP perpendicular to the slope and integrate well.
 - Do not displace or damage the RECP.
 - After the final application, do not allow pedestrians or equipment on the treated areas.
 - Follow-up applications shall be made as needed to cover weak spots, and to maintain adequate soil protection.
 - Avoid over-spray onto the traveled way, sidewalks, lined drainage channels, and existing vegetation.
- Additional guidance on the selection of soil stabilization BMPs can be found in Appendix B of this Manual.
- All seeded areas must be inspected for failures and re-seeded, fertilized, and mulched within the planting season, using not less than half the original application rates. Any temporary revegetation efforts that do not provide adequate cover must be reapplied at a scheduled recommended by the licensed professional.
- A certificate of compliance under Standard Specifications Section 21-2.01C(4) for the applicable BMP must be submitted to the RE prior to application to ensure proper mix is being used.
- It is recommended that a small test area/mock-up occurs prior to large area application to verify sufficient cover for the approved mix.

- After any rain event, the Contractor is responsible for maintaining all slopes to prevent erosion.
 - Areas where Hydroseeding will be implemented must be shown in the WPCDs. Application timeframes (dates) must be included in the WPCS.
 - Must ensure correct application rates and passes (different directions) take place to ensure adequate coverage.
- SWPPP
or WPCP
- Hydroseeding must be discussed in Section 500.3.2 of SWPPP or Section 30.2 of the WPCP.

Standard Symbol

BMP Objectives	
Soil Stabilization	<input checked="" type="checkbox"/>
Sediment Control	<input type="checkbox"/>
Tracking Control	<input checked="" type="checkbox"/>
Wind Erosion Control	<input checked="" type="checkbox"/>
Non-Stormwater Management	<input type="checkbox"/>
Materials and Waste Management	<input type="checkbox"/>

- Definition and Purpose** Soil binders consist of applying and maintaining a soil stabilizer to exposed soil surfaces. Soil binders are materials applied to the soil surface to temporarily prevent water-induced erosion of exposed soils on construction sites. Soil binders also provide temporary dust, wind, and soil stabilization (erosion control) benefits. This is one of five temporary soil stabilization alternatives to consider.
- Appropriate Applications** Soil binders are typically applied to disturbed areas requiring short-term temporary protection. Because soil binders can often be incorporated into the work, they may be a good choice for areas where grading activities will soon resume. Application on stockpiles to prevent water and wind erosion.
- Limitations**
- Soil binders are temporary in nature and may need reapplication.
 - Soil binders require a minimum curing time until fully effective, as prescribed by the manufacturer. Soil binders may need reapplication after a storm event.
 - Soil binders will generally experience spot failures during heavy rainfall events. If runoff penetrates the soil at the top of a slope treated with a soil binder, it is likely that the runoff will undercut the stabilized soil layer and discharge at a point further down slope.
 - Soil binders do not hold up to pedestrian or vehicular traffic across treated areas.
 - Soil binders may not penetrate soil surfaces made up primarily of silt and clay, particularly when compacted.
 - Some soil binders may not perform well with low relative humidity. Under rainy conditions, some agents may become slippery or leach out of the soil.
 - May not cure if low temperatures occur within 24 hours of application.

Standards and Specifications

General Considerations

- Site-specific soil types will dictate appropriate soil binders to be used.
- A soil binder must be environmentally benign (non-toxic to plant and animal life), easy to apply, easy to maintain, economical, and shall not stain paved or painted surfaces, refer to Standard Specifications Section 13,18 and 21.
- Some soil binders are compatible with existing vegetation.
- Performance of soil binders depends on temperature, humidity, and traffic across treated areas.
- Avoid over-spray onto the traveled way, sidewalks, lined drainage channels, and existing vegetation.
- Storm water quality runoff sampling is required for many soil binders. Per table 5-1, footnote 7, of the 2013 Construction Site Monitoring Program Guidance Manual the following copolymers/polymers do not discharge pollutants and water quality sampling and analysis is not required Super Tak, M-binder, Fish Stik, Pro40dc, Fisch-Bond, Soil Master WR and EarthGuard.

Soil Binders Applications

After selecting an appropriate soil binder, the untreated soil surface must be prepared before applying the soil binder. The untreated soil surface must contain sufficient moisture to assist the agent in achieving uniform distribution. In general, the following steps shall be followed:

- Follow manufacturer’s recommendations for application rates, pre-wetting of application area, and cleaning of equipment after use.
- Prior to application, roughen embankment and fill areas by rolling with a crimping or punching type roller or by track walking. Track walking shall only be used where rolling is impractical.
- Consider the drying time for the selected soil binder and apply with sufficient time before anticipated rainfall. Soil binders shall not be applied during or immediately before rainfall.
- Avoid over-spray onto the traveled way, sidewalks, lined drainage channels, sound walls, and existing vegetation.
- Soil binders shall not be applied to frozen soil, areas with standing water, under freezing or rainy conditions, or when the air temperature is below 4°C (40°F) during the curing period.
- More than one treatment is often necessary, although the second treatment may be diluted or have a lower application rate.
- Generally, soil binders require a minimum curing time of 24 hours before they are fully effective. Refer to manufacturer’s instructions for specific cure times.

- For liquid agents:
 - Crown or slope ground to avoid ponding.
 - Uniformly pre-wet ground at 0.03 to 0.3 gal/yd² or according to manufacturer’s recommendations.
 - Apply solution under pressure. Overlap solution 6 to 12 in.
 - Allow treated area to cure for the time recommended by the manufacturer; typically, at least 24 hours.
 - In low humidities, reactivate chemicals by re-wetting with water at 0.1 to 0.2 gal/yd².

Selecting a Soil Binder

Properties of common soil binders used for erosion control are provided in Table 1 and Appendix B. Use Table 1 to select an appropriate soil binder.

Table 1
Properties of Soil Binders for Erosion Control

Chemicals	Plant Material Based (Short Lived)	Plant Material Based (Long Lived)	Polymeric Emulsion Blends	Cementitious-Based Binders
Relative Cost	Low	Low	Low	Low
Resistance to Leaching	High	High	Low to Moderate	Moderate
Resistance to Abrasion	Moderate	Low	Moderate to High	Moderate to High
Longevity	Short to Medium	Medium	Medium to Long	Medium
Minimum Curing Time before Rain	9 to 18 hours	19 to 24 hours	0 to 24 hours	4 to 8 hours
Compatibility with Existing Vegetation	Good	Poor	Poor	Poor
Mode of Degradation	Biodegradable	Biodegradable	Photodegradable/ Chemically Degradable	Photodegradable/ Chemically Degradable
Labor Intensive	No	No	No	No
Specialized Application Equipment	Water Truck or Hydraulic Mulcher	Water Truck or Hydraulic Mulcher	Water Truck or Hydraulic Mulcher	Water Truck or Hydraulic Mulcher
Liquid/Powder	Powder	Liquid	Liquid/Powder	Powder
Surface Crusting	Yes, but dissolves on rewetting	Yes	Yes, but dissolves on rewetting	Yes
Clean-Up	Water	Water	Water	Water
Erosion Control Application Rate	Varies ⁽¹⁾	Varies ⁽¹⁾	Varies ⁽¹⁾	4,500 to 13,500 kg/ha

(1) Dependant on product, soil type, and slope inclination

Factors to consider when selecting a soil binder include the following:

- Suitability to situation - Consider where the soil binder will be applied; determine if it needs a high resistance to leaching or abrasion, and whether it needs to be compatible with any existing vegetation. Determine the length of time soil stabilization will be needed, and if the soil binder will be placed in an area where it will degrade rapidly. In general, slope steepness is not a discriminating factor for the listed soil binders.
- Soil types and surface materials - Fines and moisture content are key properties of surface materials. Consider a soil binder's ability to penetrate, likelihood of leaching, and ability to form a surface crust on the surface materials.
- Frequency of application - The frequency of application can be affected by subgrade conditions, surface type, climate, and maintenance schedule. Frequent applications could lead to high costs. Application frequency may be minimized if the soil binder has good penetration, low evaporation, and good longevity. Consider also that frequent application will require frequent equipment clean-up.

After considering the above factors, the soil binders in Table 1 will be generally appropriate as follows:

Plant-Material Based (Short Lived)

-*Guar*: Guar gum based tackifier must be derived from the ground endosperm of the guar plant, *Cyanmopsis tetragonolobus*. It must be treated with dispersing agents for easy mixing.. It shall be diluted at the rate of 1 to 5 lb per 100 gallons of water, depending on application machine capacity. Recommended minimum application rates are as follows:

Application Rates for Guar Soil Stabilizer

Slope (V:H):	Flat	1:4	1:3	1:2	1:1
Kg/Ha:	45	50	56	67	78
lb/ac	40	45	50	60	70

-*Psyllium*: Psyllium is composed of the finely ground muciloid coating of plantago seeds that is applied as a dry powder or in a wet slurry to the surface of the soil. It dries to form a firm but rewettable membrane that binds soil particles together but permits germination and growth of seed. Psyllium requires 12 to 18 hours drying time. Psyllium shall be applied at a rate of 80 to 200 lb/ac, with enough water in solution to allow for a uniform slurry flow.

-Starch: Starch is non-ionic, water soluble granular cornstarch. The material is mixed with water and applied at the rate of 150 lb/ac. Approximate drying time is 9 to 12 hours.

Plant-Material Based (Long Lived)

-Pitch and Rosin Emulsion: Generally, a non-ionic pitch and rosin emulsion has a minimum solids content of 48%. The rosin shall be a minimum of 26% of the total solids content. The soil stabilizer shall be non-corrosive, water-dilutable emulsion that upon application cures to a water insoluble binding and cementing agent. For soil erosion control applications, the emulsion is diluted and shall be applied as follows:

For clayey soil: 5 parts water to 1 part emulsion

For sandy soil: 10 parts water to 1 part emulsion

Application can be by water truck or hydraulic seeder with the emulsion/product mixture applied at the rate specified by the manufacturer. Approximate drying time is 19 to 24 hours.

Polymeric Emulsion Blends

-Acrylic Copolymers and Polymers: Polymeric soil stabilizers shall consist of a liquid or solid polymer or copolymer with an acrylic base that contains a minimum of 55% solids. The polymeric compound shall be handled and mixed in a manner that will not cause foaming or shall contain an anti-foaming agent. The polymeric emulsion shall not exceed its shelf life or expiration date; manufacturers shall provide the expiration date. Polymeric soil stabilizer shall be readily miscible in water, non-injurious to seed or animal life, non-flammable, shall provide surface soil stabilization for various soil types without totally inhibiting water infiltration, and shall not re-emulsify when cured. The applied compound shall air cure within a maximum of 36 to 48 hours. Liquid copolymer shall be diluted at a rate of 10 parts water to 1 part polymer and applied to soil at a rate of 1,175 gal/ac.

-Liquid Polymers of Methacrylates and Acrylates: This material consists of a tackifier/sealer that is a liquid polymer of methacrylates and acrylates. It is an aqueous 100% acrylic emulsion blend of 40% solids by volume that is free from styrene, acetate, vinyl, ethoxylated surfactants or silicates. For soil stabilization applications, it is diluted with water in accordance with manufacturer's recommendations, and applied with a hydraulic seeder at the rate of 20 gal/ac. Drying time is 12 to 18 hours after application.

-Copolymers of Sodium Acrylates and Acrylamides: These materials are non-toxic, dry powders that are copolymers of sodium acrylate and acrylamide. They are mixed with water and applied to the soil surface for erosion control at rates that are determined by slope gradient:

Slope Gradient (V:H)	kg/ha (lb/ac)
Flat to 1:5	3-5
1:5 to 1:3	5-10
1:2 to 1:1	10-20

-Poly-Acrylamide and Copolymer of Acrylamide: Linear copolymer polyacrylamide is packaged as a dry-flowable solid. When used as a stand-alone stabilizer, it is diluted at a rate of 1 lb/100 gal of water and applied at the rate of 5 lb/ac.

-Hydro-Colloid Polymers: Hydro-Colloid Polymers are various combinations of dry-flowable poly-acrylamides, copolymers and hydro-colloid polymers that are mixed with water and applied to the soil surface at rates of 53 to 62 lb/ac. Drying times are 0 to 4 hours.

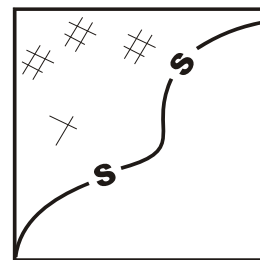

Cementitious-Based Binders

-Gypsum: This is a formulated gypsum-based product that readily mixes with water and mulch to form a thin protective crust on the soil surface. It is composed of high purity gypsum that is ground, calcined and processed into calcium sulfate hemihydrate with a minimum purity of 86%. It is mixed in a hydraulic seeder and applied at rates 4,000 to 12,000 lb/ac. Drying time is 4 to 8 hours.

- Additional guidance on the selection of soil stabilization BMPs can be found in Appendix B of this Manual.

- Maintenance and Inspection
 - Reapplying the selected soil binder may be needed for proper maintenance. High traffic areas shall be inspected daily, and lower traffic areas shall be inspected weekly.
 - A certificate of compliance under Standard Specifications Section 21-2.01C(4) must be submitted to the RE prior to application.
 - It is recommended that a small test area/mock-up occurs prior to large area application to verify sufficient cover for the approved mix.
 - After any rainfall event, the Contractor is responsible for maintaining all slopes to prevent erosion.
 - Maintain an unbroken, temporary stabilized area while DSAs are inactive. Repair any damaged stabilized area and re-apply soil binder to exposed areas.
 - Cleaning of equipment must be done in a designated area that can collect the water to prevent triggering of non-visible and non-stormwater requirements.
- SWPPP or WPCP
 - Soil Binders must be discussed in Section 500.3.2 of the SWPPP or Section 30.2 of the WPCP.

BMP Objectives	
Soil Stabilization	<input checked="" type="checkbox"/>
Sediment Control	<input type="checkbox"/>
Tracking Control	<input type="checkbox"/>
Wind Erosion Control	<input checked="" type="checkbox"/>
Non-Stormwater Management	<input type="checkbox"/>
Materials and Waste Management	<input type="checkbox"/>

- Definition and Purpose** Straw mulch consists of placing a uniform layer of straw and incorporating it into the soil with a studded roller, or anchoring it with a tackifier or Rolled Erosion Control Product (RECP). This is one of the temporary soil stabilization alternatives to consider.
- Appropriate Applications**
- Straw mulch is typically used for soil stabilization as a temporary surface cover on disturbed areas until soils can be prepared for revegetation and permanent vegetation is established.
 - Also typically used in combination with temporary and/or permanent seeding strategies to enhance plant establishment.
- Limitations**
- Availability of erosion control contractors and straw may be limited prior to the rain events due to high demand.
 - There is a potential for introduction of weed-seed and unwanted plant material.
 - Straw mulch applied by hand is more time intensive and potentially costly.
 - May have to be removed prior to permanent seeding or soil stabilization.
 - “Punching” of straw does not work in sandy soils, must use a tackifier.

Standards and Specifications

General Requirements

- Straw and tackifier must conform to Standard Specifications Sections 21-2.02H, 21.2-03G and 21-2.02E.
- Submit a certificate of compliance for straw before application. If weed-free straw is used, the certificate of compliance must include the certificate of quarantine compliance.
- Straw must be derived from wheat, rice, or barley.
- A tackifier is the preferred method for anchoring straw mulch to the soil on slopes.
- Selected tackifier must be environmentally benign (non-toxic to plants and animal life) and does not pose a threat to water quality.
- Crimping, “punch” roller-type rollers, or track-walking may also be used to incorporate straw mulch into the soil on slopes. Track walking shall only be used where other methods are impractical.
- Avoid placing straw onto the traveled way, sidewalks, lined drainage channels, sound walls, and existing vegetation.
- Straw mulch with tackifier should not be applied during or immediately before a rain event.

Application Procedures

- Apply loose straw at the rate indicated either by machine or by hand distribution.
- The straw mulch must be evenly distributed on the soil surface.
- Straw may be anchored in place by incorporating it into soil or using a tackifier. Additionally, in small areas and/or steep slopes, straw mulch can also be held in place using Rolled Erosion Control Product. Refer to BMP SS-7, “Temporary Cover and Rolled Erosion Control Products.”
- If a tackifier will be used to anchor the straw mulch in lieu of incorporation, roughen embankment or fill areas by rolling with a crimping or punching-type roller. Track walking should only be used where rolling is impractical.
- A tackifier acts to glue the straw fibers together and to the soil surface. Factors influencing tackifier selection include longevity and ability to hold the fibers in place.
- Apply tackifier according to the manufacturer’s instructed rate for the slope, soil, and wind conditions.
- If incorporation of straw mulch into soil is the selected method for anchoring, then do as follows:
 - A spade or shovel can be used to incorporate straw into soil in small areas.
 - On slopes with soils that are stable enough and of sufficient gradient to safely support construction equipment without contributing to

compaction and instability problems, straw can be “punched” into the ground using a knife-blade roller or a straight bladed coultter, known commercially as a “crimper” under Section 21-2.03J of the Standard Specifications.

- Maintenance and Inspections
 - Straw needs to last long enough to achieve erosion control objectives.
 - Maintain an unbroken, temporary mulched ground cover while DSAs are inactive. Repair any damaged ground cover and re-mulch exposed areas.
 - Reapplication of straw mulch and tackifier may be required by the RE to maintain effective soil stabilization over disturbed areas and slopes.
 - After any rainfall event, the Contractor is responsible for maintaining all slopes to prevent erosion.

- SWPPP or WPCP
 - Straw Mulch must be discussed in Section 500.3.2 of the SWPPP or Section 30.2 of the WPCP.

BMP Objectives	
Soil Stabilization	<input checked="" type="checkbox"/>
Sediment Control	<input checked="" type="checkbox"/>
Tracking Control	<input type="checkbox"/>
Wind Erosion Control	<input checked="" type="checkbox"/>
Non-Stormwater Management	<input type="checkbox"/>
Materials and Waste Management	<input type="checkbox"/>

Definition and Purpose This BMP involves the placement of geosynthetics, turf reinforcement mats, plastic covers, or rolled erosion control products (RECPs), including erosion control blankets, to stabilize disturbed soil areas and protect soils from erosion by wind or water. This is one of the temporary soil stabilization alternatives to consider.

- Appropriate Applications**
- These measures are used when disturbed soils may be particularly difficult to stabilize, including the following situations:
 - Steep slopes, generally steeper than 3:1 (H:V).
 - Slopes where the erosion potential is high.
 - Slopes and disturbed soils where mulch must be anchored.
 - Disturbed areas where plants are slow to develop.
 - Channels with flows exceeding 3 ft/s.
 - Channels to be vegetated.
 - Slopes adjacent to receiving waters or ESAs.
 - Standards for plastic sheeting used for stockpile covers are provided in Section 14-11.05A of the Standard Specifications.

- Limitations**
- Blankets and mats are typically more expensive than other erosion control measures, due to labor and material costs. This usually limits their application to areas inaccessible to hydraulic equipment, or where other measures are not applicable, such as channels.
 - May delay seed germination due to reduction in soil temperature.
 - Plastic netting should not be used when regulatory permits prohibit their use or if there is a potential for plastic netting to endanger wildlife.
 - Blankets and mats are generally not suitable for excessively rocky sites or areas where the final vegetation will be mowed (since staples and netting can catch in mowers).
 - Blankets and mats should be removed and disposed of prior to application of permanent soil stabilization measures as required by the contract plans. Long-term erosion control blankets must be Class 8 Rock Slope Protection fabric.
 - Plastic sheeting is easily vandalized, easily torn, photodegradable, and must be disposed of at a landfill and requires extensive inspection and maintenance.
 - Plastic results in 100 percent runoff, which may cause serious erosion problems in the downstream areas receiving the increased flow.
 - The use of plastic should be limited to covering stockpiles, or very small graded areas for short periods of time (such as through one imminent storm event), until alternative measures, such as seeding and mulching, can be installed.
 - Geosynthetics, mats, plastic covers, and RECPs have maximum flow rate limitations; consult the manufacturer for proper selection.
 - Additional guidance for selection of soil stabilization BMPs is provided in Appendix B of this Manual.

Standards and Specifications ***Material Selection***

- There are many types of temporary cover material and RECPs, and selection of the appropriate type is based on the specific type of application and site conditions. Selection(s) made by the Contractor must be approved by the Resident Engineer; certification of compliance must be in accordance with Standard Specifications Sections 6-2 and 21-2.01C and 21-2.02O.

Temporary Cover – Geosynthetics

- Material shall be a woven polypropylene fabric with minimum thickness of 0.06 inch, minimum width of 12 feet and meet all requirements of Standard Specification Section 96-1 Temporary Cover. Material shall have a minimum tensile strength of 150 lb (warp) and 80 lbs (fill) in conformance with the requirements in ASTM Designation: D 4632. The permittivity of the fabric must be approximately 0.07 sec –1 in conformance with the requirements in

ASTM Designation: D4491. The fabric must have an ultraviolet (UV) stability of 70 percent in conformance with the requirements in ASTM designation: D4355. Geotextile blankets should be secured in place with wire staples or sandbags and by keying into tops of slopes and edges to prevent infiltration of surface water. Staples should be made of minimum 16 gauge steel wire and be U-shaped with 8-inch legs and 2-inch crown.

- Geotextiles may be reused if, in the opinion of the RE, they are suitable for the use intended.
- Submit a certificate of compliance for each type of geosynthetic material used.

Temporary Cover – Plastic Sheeting

- Plastic sheeting shall comply with Standard Specification Section 13-5 and 96-1 which requires a minimum thickness of 0.39 inches, and be keyed in at the top of slope and firmly held in place with gravel-filled bags placed no more than 6 feet apart or other weights authorized by the RE. Seams are typically taped or weighted down their entire length, and there should be at least a 12 to 24 inches overlap of all seams. Edges must be embedded a minimum of 6 inches in soil.
- All sheeting must be inspected periodically after installation and after rain events to check for erosion, undermining, and anchorage failure. Any failures must be repaired immediately. If washout or breakages occurs, the material should be re-installed after repairing the damage to the slope or area.

Rolled Erosion Control Products

- RECPs are typically composed of jute fibers, curled wood fibers, straw, coconut fiber, or a combination of these materials. For an RECP to be considered 100 percent biodegradable, the netting, sewing or adhesive system that holds the biodegradable mulch fibers together must also be biodegradable.
 - **Jute mesh** is made from a natural fiber that is spun into a yarn, then loosely woven into a biodegradable mesh. It is designed to be used in conjunction with vegetation and has longevity of approximately one year. The material is supplied in rolled strips that are secured to the soil with steel U-shaped staples. Jute mesh shall comply with all requirements of Jute mesh table included in Standard Specification Section 21-2.
 - **Erosion control blanket** is a machine-produced mat made of processed natural fibers that are bound together to form a continuous matrix surrounded by two natural nets. The processed natural fibers comprising the matrix of the blanket may be a mixture of straw (70 percent) and coconut (30 percent), woven coir (100 percent), or excelsior (curled wood fiber) (80 percent). Erosion control blankets must be furnished in rolled strips a minimum of 72 inches wide, and secured in place with steel U-shaped staples. Erosion control blankets must also comply with Section 21-2.02O(4) of the Standard Specifications.

- **Netting** consists of pure coconut fibers, or coir, woven into a matrix. Coir netting must be furnished in rolled strips a minimum of 72 to 158 inches in width and 0.3 inches thick. There are three classes of coir netting: Type A, Type B, and Type C. See Section 21-2.02O(3) of the Standard Specifications for the minimum requirements for each type of netting.
- Non-biodegradable RECPs are typically composed of polypropylene, polyethylene, nylon or other synthetic fibers. In some cases, a combination of biodegradable and synthetic fibers is used to construct the RECP. Netting used to hold these fibers together is typically non-biodegradable as well. Check contract special provisions to determine whether non-biodegradable products are not to be used based on regulatory requirements.
 - **Turf reinforcement mat** is a nondegradable, open-weave textile made of synthetic fibers, filaments, nets, wire mesh, or other elements processed into a permanent three-dimensional matrix. Turf reinforcement mats must be a minimum of 72 inches in width and 0.25 inches thick. There are three classes of turf reinforcement mat: Type A, Type B, and Type C. See section 21-2.02O(5) of the Standard Specifications for the minimum requirements for each type of netting.
 - **Plastic netting** is a lightweight biaxially-oriented netting designed for securing loose mulches like straw to soil surfaces to establish vegetation. The netting is photodegradable. The netting is supplied in rolled strips, which should be secured with U-shaped staples or stakes in accordance with manufacturers' recommendations.
 - **Plastic mesh** is an open-weave geotextile that is composed of an extruded synthetic fiber woven into a mesh with an opening size of less than 0.25 inch. It is used with revegetation or may be used to secure loose fiber such as straw to the ground. The material is supplied in rolled strips, which should be secured to the soil with U-shaped staples or stakes in accordance with manufacturers' recommendations.
 - **Synthetic fiber with netting** is a mat that is composed of durable synthetic fibers treated to resist chemicals and ultraviolet light. The mat is a dense, three-dimensional mesh of synthetic (typically polyolefin) fibers stitched between two polypropylene nets. The mats are designed to be revegetated and provide a permanent composite system of soil, roots, and geomatrix. The material is furnished in rolled strips, which should be secured with U-shaped staples or stakes in accordance with manufacturers' recommendations.
 - **Bonded synthetic fibers** consist of a three-dimensional geomatrix nylon (or other synthetic) matting. Typically it has more than 90 percent open area, which facilitates root growth. Its tough root-reinforcing system anchors vegetation and protects against hydraulic lift and shear forces created by high volume discharges. It can be installed over prepared soil, followed by seeding into the mat. Once vegetated, it becomes an

invisible composite system of soil, roots, and geomatrix. The material is furnished in rolled strips that should be secured with U-shaped staples or stakes in accordance with manufacturers' recommendations.

- **Combination synthetic and biodegradable RECPs** consist of biodegradable fibers, such as wood fiber or coconut fiber, with a heavy polypropylene net stitched to the top and a high-strength continuous-filament geomatrix or net stitched to the bottom. The material is designed to enhance revegetation. The material is furnished in rolled strips, which should be secured with U-shaped staples or stakes in accordance with manufacturers' recommendations.

Site Preparation

- Proper site preparation is essential to ensure complete contact of the blanket or matting with the soil.
- Grade and shape the area of installation.
- Remove all rocks, clods, vegetation or other obstructions larger than 1 inch in size. Fill voids or depressions.
- Proper site preparation ensures that the products and covers will have complete, direct contact with the soil.

Seeding

- If applicable, seed the area before RECP installation for erosion control and revegetation.
- Check all slots and other areas disturbed during installation must be re-seeded.
- For turf reinforcement mats, seeding is often specified to occur after installation.

Anchoring

- U-shaped wire staples, metal stake pins, triangular wooden stakes, or fasteners recommended by manufacturers can be used to anchor mats and blankets to the ground surface in conformance with Standard Specification section 13-10.
- Staples should be made of minimum 16 gauge steel wire and be U-shaped with 8-inch legs and 2-inch crown.
- Metal stake pins should be 0.188 inch diameter steel with a 1.5 inch steel washer at the head of the pin, and 8 inch in length.
- Wire staples and metal stakes should be driven flush to the soil surface.
- All anchors should be 6 inch to 18 inch long and have sufficient ground penetration to resist pullout. Longer anchors may be required for loose soils.

Installation on Slopes

- Refer to Standard Plans T53 and T54 for details regarding installation on slopes for temporary uses, and H52 for permanent uses.

Installation in Channels

- Refer to Standard Plan T55 for details regarding installation in channels.
- Installation shall be in accordance with the manufacturer's recommendations. In general, these will be as follows:
 - Dig initial anchor trench 12 in deep and 6 in wide across the channel at the lower end of the project area.
 - Excavate intermittent check slots, 6 in deep and 6 in wide across the channel at 25 ft to 30 ft intervals along the channels.
 - Cut longitudinal channel anchor slots 4 in deep and 4 in wide along each side of the installation to bury edges of matting, whenever possible extend matting 2 in to 3 in above the crest of the channel side slopes.
 - Beginning at the downstream end and in the center of the channel, place the initial end of the first roll in the anchor trench and secure with fastening devices at 12 in intervals. Note: matting will initially be upside down in anchor trench.
 - In the same manner, position adjacent rolls in anchor trench, overlapping the preceding roll a minimum of 3 in.
 - Secure these initial ends of mats with anchors at 12 in intervals, backfill and compact soil.
 - Unroll center strip of matting upstream. Stop at next check slot or terminal anchor trench. Unroll adjacent mats upstream in similar fashion, maintaining a 3 in overlap.
 - Fold and secure all rolls of matting snugly into all transverse check slots. Lay mat in the bottom of the slot then fold back against itself. Anchor through both layers of mat at 12 in intervals, then backfill and compact soil. Continue rolling all mat widths upstream to the next check slot or terminal anchor trench.
 - Alternate method for non-critical installations: Place two rows of anchors on 6 in centers at 25 ft to 30 ft intervals in lieu of excavated check slots.
 - Shingle-lap spliced ends by a minimum of 12 in apart on 12 in intervals.
 - Place edges of outside mats in previously excavated longitudinal slots, anchor using prescribed staple pattern, backfill and compact soil.
 - Anchor, fill and compact upstream end of mat in a 12 in by 6 in terminal trench.

Temporary Cover and Rolled Erosion Control Products

SS-7

- Secure mat to ground surface using U-shaped wire staples, geotextile pins, or wooden stakes.
- Seed and fill turf reinforcement matting with soil, if specified.

Soil Filling (if specified for turf reinforcement)

- Always consult the manufacturer's recommendations for installation.
- Do not drive tracked or heavy equipment over mat.
- Avoid any traffic over matting if loose or wet soil conditions exist.
- Use shovels, rakes or brooms for fine grading and touch up.
- Smooth out soil filling, just exposing top netting of mat.

Temporary Soil Stabilization Removal

- When no longer required for the work, temporary soil stabilization becomes the property of the Contractor.
- Temporary soil stabilization removed from the site of the work must be disposed of outside the highway right-of-way in conformance with the provisions in Standard Specifications Section 14-10. If approved by the RE, the contractor may leave the temporary soil stabilizer in place.

Maintenance and Inspection

Areas treated with temporary soil stabilization must be inspected as specified in the Standard Specifications and special provisions. Areas treated with temporary soil stabilization must be maintained to provide adequate erosion control. Temporary soil stabilization should be reapplied or replaced on exposed soils when area becomes exposed or exhibits visible erosion.

- All blankets and mats must be inspected periodically after installation.
- Installation should be inspected after significant rain events to check for erosion and undermining. Any failures must be repaired immediately.
- If washout or breakage occurs, re-install the material after repairing the damage to the slope or channel.

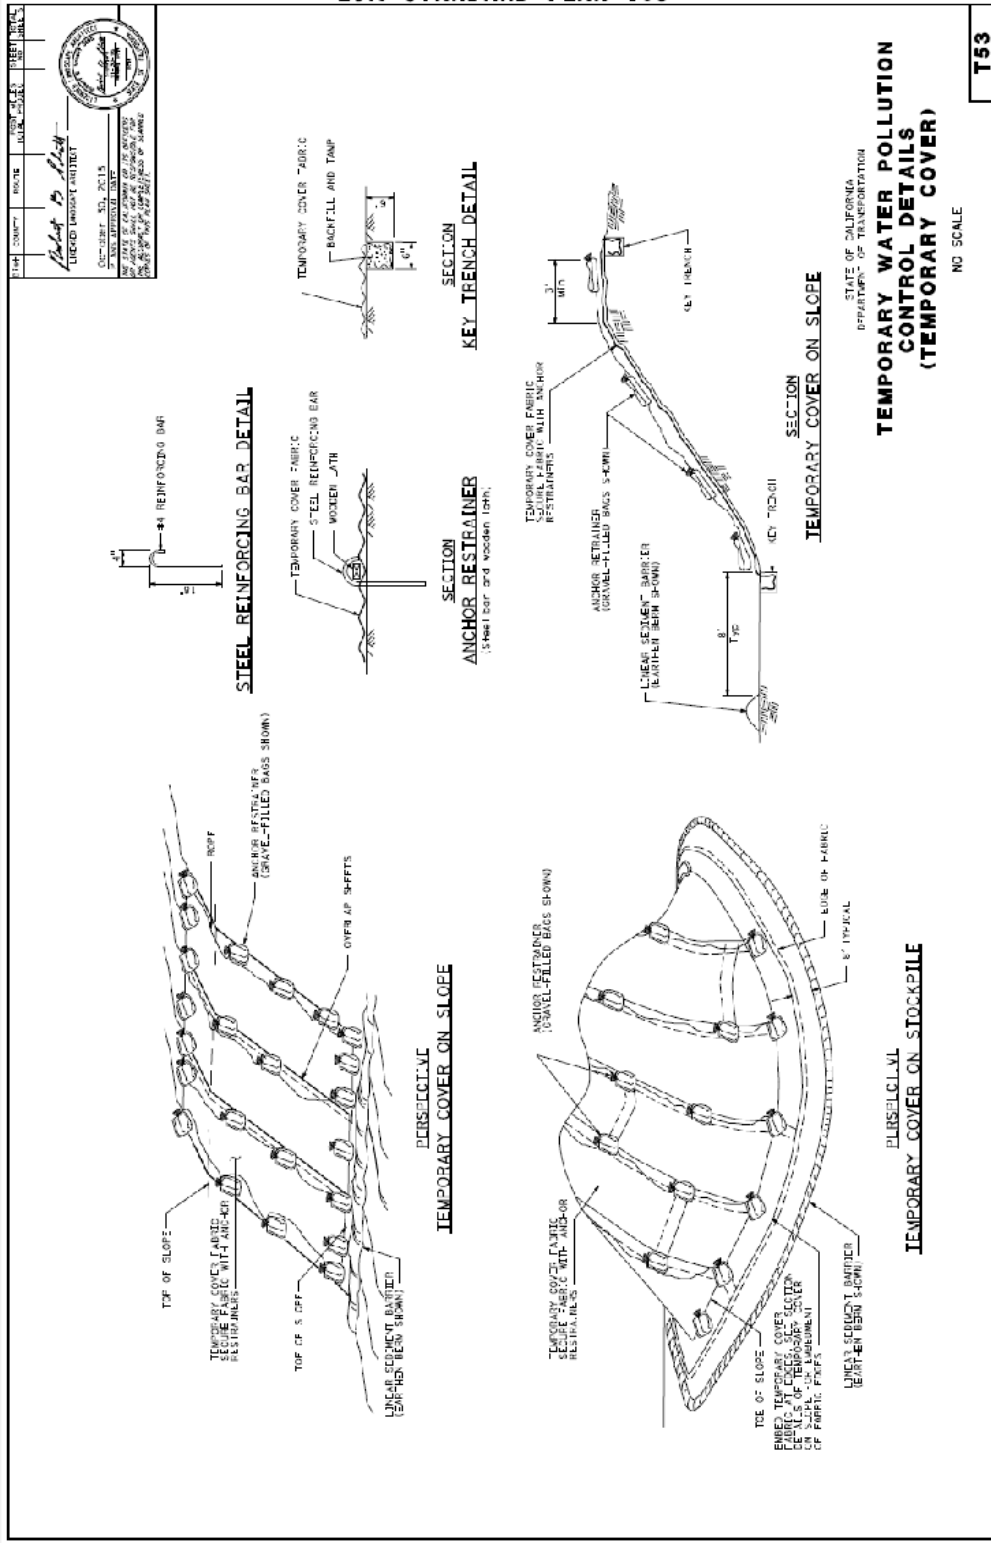

SWPPP or WPCP

- RECP must be discussed in Section 500.3.2 of the SWPPP or Section 30.2 of the WPCP.

Definition and Purpose

Wood mulching consist of applying a mixture of shredded bark, wood chips, or tree trimmings on top of soil. Wood mulch is mostly applicable to landscape projects.

The primary function of wood mulching is to reduce erosion by protecting bare soil from rainfall impact, increasing infiltration, and reducing runoff.

Appropriate Applications

- Wood mulching is considered a temporary soil stabilization alternative in the following situations:
 - As a stand-alone temporary surface cover on disturbed areas until soils can be prepared for revegetation and permanent vegetative cover can be established.
 - As short term, non-vegetative ground cover on slopes to reduce rainfall impact, decrease the velocity of sheet flow, settle out sediment and reduce wind erosion.
 - In combination with other BMPs, mulch may be used to stabilize roadway embankment slopes and control wind erosion.

Limitations

- Wood mulch may introduce unwanted species of vegetation.
- Shredded wood does not withstand concentrated flows and is prone to sheet erosion.
- Green material has the potential for the presence of unwanted weeds and other plant materials. Delivery system is primarily by manual labor, although pneumatic application equipment is available.
- Mulch may need to be removed prior to further earthwork.

Standards and Specifications

- Mulch should not be used alone to stabilize embankments or sides of swales where concentrated flows could mobilize the material.

Mulch Selection

There are many types of mulches, including tree bark mulch, wood chip mulch, shredded bark mulch, and tree trimming mulch. Selection of the appropriate type should be based on the type of application and site conditions. Prior to use of wood mulches, obtain concurrence with the District Landscape Architect because some mulch used on construction projects may not be compatible with planned or future projects.

Selection of wood mulches must comply with Standard Specifications Section 20-5.03E, and must be approved by the RE.

Tree Bark Mulch

- Tree bark mulch must be derived from cedar, Douglas fir, or redwood tree species.
- Tree bark mulch must be ground such that at least 95 percent of the material by volume is less than 2 inches in any direction and no more than 30 percent by volume is less than 1 inch in any direction.

Wood Chip Mulch

- Wood chip mulch must be derived from clean wood, and it may not contain leaves or small twigs.
- Wood chip mulch must contain at least 95 percent wood strands by volume with an average thickness of 1/8 to 1-1/2 inches in any direction and 2 to 8 inches in length.

Shredded Bark Mulch

- Shredded bark mulch must be derived from trees. The mulch must be a blend or loose, long, thin wood or bark pieces.
- Shredded bark mulch must contain at least 95 percent wood strands by volume with an average thickness of 1/8 to 1-1/2 inches in any direction and 2 to 8 inches in length

Tree Trimming Mulch

- Tree trimming mulch is derived from chipped trees and may contain leaves, small twigs, and green material.
- Tree trimming mulch must contain at least 95 percent material by volume less than 3 inches and no more than 30 percent by volume less than 1 inch

Application Procedures

- Do not use soil sterilant or filter fabric.
- Mulch should be placed uniformly from the outside edge of area designated for mulch. Permanent, landscape mulch should be placed after vegetation has been installed.

Maintenance and Inspection

SWPPP or WPCP

- Mulch may be installed by manual application or with pneumatic devices.
- Do not place mulch within 4 ft of the flow line of drainage ditches or other channels, or the edge of paved roads.
- All material must be removed before re-starting work on the slopes.
- Wood mulch needs to last long enough to achieve erosion-control objectives. If the mulch is applied as a stand-alone erosion control method over disturbed areas (without seed), it should last the length of time the site will remain barren or until final re-grading and revegetation. Additional information is provided in Appendix B of this Manual.
- Where vegetation is not the ultimate cover, such as ornamental and landscape applications of bark or wood chips, inspection and maintenance should focus on longevity and integrity of the mulch.
- May require reapplication when bare soil becomes visible.
- Wood Mulch must be discussed in Section 500.3 of the SWPPP or Section 30.2 of the WPCP.

This page intentionally left blank

3.2 Temporary Concentrated Flow Conveyance Controls

Temporary concentrated flow conveyance controls consist of a system of measures or BMPs that are used alone or in combination to intercept, divert, convey and discharge concentrated flows with a minimum of soil erosion, both on-site and downstream (off-site). Temporary concentrated flow conveyance controls may be required to direct run-on around or through the project in a non-erodible fashion. Temporary concentrated flow conveyance controls include the following BMPs:

- Earth Dikes/Drainage Swales & Lined Ditches
- Outlet Protection/Velocity Dissipation Devices
- Slope Drains

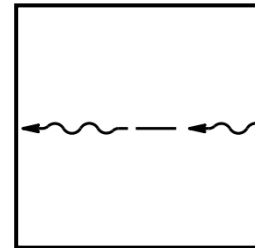

Table 3-1. Temporary Soil Stabilization BMPs	
ID	BMP Name
SS-1	Scheduling
SS-2	Preservation of Existing Vegetation
SS-3	Hydraulic Mulch

Earth Dikes/Drainage Swales and Lined Ditches

SS-9

Standard Symbol

BMP Objectives	
Soil Stabilization	<input checked="" type="checkbox"/>
Sediment Control	<input type="checkbox"/>
Tracking Control	<input type="checkbox"/>
Wind Erosion Control	<input type="checkbox"/>
Non-Stormwater Management	<input type="checkbox"/>
Materials and Waste Management	<input type="checkbox"/>

Definition and Purpose

These are structures that intercept, divert and convey surface run-on, generally sheet flow, to prevent erosion.

Appropriate Applications

- Earth dikes/drainage swales and lined ditches may be used to:
 - Convey surface runoff down sloping land.
 - Intercept and divert runoff to avoid sheet flow over sloped surfaces.
 - Divert and direct runoff towards a stabilized watercourse, drainage pipe or channel.
 - Intercept runoff from paved surfaces.
- Earth dikes/drainage swales and lined ditches also may be used:
 - Below steep grades where runoff begins to concentrate.
 - Along roadways and facility improvements subject to flood drainage.
 - At the top of slopes to divert run-on from adjacent or undisturbed slopes.
 - At bottom and mid-slope locations to intercept sheet flow and convey concentrated flows.

Earth Dikes/Drainage Swales and Lined Ditches

SS-9

- Limitations**
- Earth dikes/drainage swales and lined ditches are not suitable as sediment trapping devices.
 - May be necessary to use other soil stabilization and sediment controls, such as check dams, plastics, and blankets, to prevent scour and erosion in newly graded dikes, swales and ditches.
 - Temporary swales and ditches should not or any other runoff diversion device should not adversely impact upstream or downstream properties.
- Standards and Specifications**
- Standard Specification Section 19-6 “Embankment Construction,” which covers allowable materials and construction procedures for dikes.
 - Standard Specification Section 72-5 “Concrete Slope Protection, Gutter, Ditch and Channel Lining” covers ditch and channel lining materials and construction procedures.
 - Care must be applied to correctly size and locate earth dikes, drainage swales and lined ditches. Excessively steep, unlined dikes and swales are subject to erosion and gully formation.
 - Must complete a careful evaluation of the risks due to erosion of the selected measure based on flow velocity, soil types, potential for over topping, flow backups, washouts, and drainage patterns for each BMP location.
 - Conveyances shall be stabilized. Consider using a lined ditch for high flow velocities to prevent scour. Compact any fills or backfills to prevent unequal settlement.
 - Do not divert runoff from the highway right-of-way onto other property.
 - When possible, install and utilize permanent dikes, swales and ditches early in the construction process.
 - Earthen berms should be 8 inches tall and 36 inches wide at a minimum. Earthen berms must be compacted either by hand or mechanical methods.
 - Provide stabilized outlets. Refer to SS-10, “Outlet Protection/Velocity/Dissipation Devices.”
- Maintenance and Inspections**
- Inspect temporary measures prior to, daily during extended rain events post-storm and weekly year-round.
 - Inspect ditches and berms for washouts. Replace lost riprap, damaged linings or soil stabilizers as needed.
 - Inspect channel linings, embankments, and beds of ditches and berms for erosion and accumulation of debris and sediment.
 - Remove debris and sediment, and repair linings and embankments to ensure they function as intended.
 - Temporary conveyances should be completely removed as soon as the surrounding drainage area has been stabilized, or at the completion of construction.

Earth Dikes/Drainage Swales and Lined Ditches

SS-9

- SWPPP or WPCP ■ Earth Dikes/Drainage Swales and Lined Ditches must be discussed in Section 500.3.2 of SWPPP or Section 30.2 of the WPCP.

Outlet Protection/Velocity Dissipation Devices

SS-10

Standard Symbol

BMP Objectives	
Soil Stabilization	<input checked="" type="checkbox"/>
Sediment Control	<input checked="" type="checkbox"/>
Tracking Control	<input type="checkbox"/>
Wind Erosion Control	<input type="checkbox"/>
Non-Stormwater Management	<input type="checkbox"/>
Materials and Waste Management	<input type="checkbox"/>

Definition and Purpose These devices are placed at pipe outlets to prevent scour and reduce the velocity and/or energy of stormwater flows.

- Appropriate Applications**
- These devices may be used at the following locations:
 - Outlets of pipes, drains, culverts, slope drains, diversion ditches, swales, conduits or channels.
 - Outlets located at the bottom of mild to steep slopes.
 - Discharge outlets that carry continuous flows of water.
 - Outlets subject to short, intense flows of water, such as flash floods.
 - Points where lined conveyances discharge to unlined conveyances.

- Limitations**
- Loose rock may have stones washed away during high flows.
 - Grouted rock slope protection may break up in areas of freeze and thaw.
 - If there is not adequate drainage, and water builds up behind grouted rock slope protection, it may cause the grouted rock slope protection to break up due to the resulting hydrostatic pressure.
 - Outlet protection may negatively impact the channel habitat.

Outlet Protection/Velocity Dissipation Devices

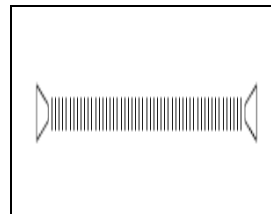

SS-10

- Standards and Specifications**
- There are many types of energy dissipaters; a flared end section and rock slope protection is shown in the figure on the previous page. Please note that this is only one example and the RE may approve other types of devices proposed by the contractor.
 - Flared end sections must comply with Standard Specification 70-5.02.
 - Rock slope protection must comply with Standard Specification Section 72.
 - Install rock slope protection, grouted rock slope protection, or concrete apron at selected outlet. Rock slope protection aprons are best suited for temporary use during construction.
 - Carefully place rock slope protection to avoid damaging the filter fabric.
 - For proper operation of apron:
 - Align apron with receiving stream and keep straight throughout its length. If a curve is needed to fit site conditions, consider placing it in upper section of apron.
 - If size of apron rock slope protection is large, consider protecting underlying filter fabric with a gravel blanket.
 - Outlets on slopes steeper than 10% should have additional protection.

- Maintenance and Inspection**
- At a minimum, perform inspections weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
 - Minimize areas of standing water by removing sediment blockages and filling scour depressions. If persistent, it might be necessary to have licensed professional re-evaluate size and type of device implemented.
 - Inspect apron for displacement of the rock slope protection and/or damage to the underlying fabric. Repair fabric and replace rock slope protection that has washed away.
 - Inspect for scour beneath the rock slope protection and around the outlet. Repair damage to slopes or underlying filter fabric immediately.
 - Temporary devices should be completely removed as soon as the surrounding drainage area has been stabilized, or at the completion of construction.

- SWPPP or WPCP**
- Outlet Protection/Velocity Dissipation Devices must be discussed in Section 500.3.2 of SWPPP or Section 30.2 of the WPCP.

Standard Symbol

BMP Objectives	
Soil Stabilization	<input checked="" type="checkbox"/>
Sediment Control	<input type="checkbox"/>
Tracking Control	<input type="checkbox"/>
Wind Erosion Control	<input type="checkbox"/>
Non-Stormwater Management	<input type="checkbox"/>
Materials and Waste Management	<input type="checkbox"/>

- Definition and Purpose** A slope drain is a pipe used to intercept and direct surface runoff or groundwater into a stabilized watercourse, trapping device or stabilized area. Slope drains are used with lined ditches to intercept and direct surface flow away from slope areas to protect cut or fill slopes.
- Appropriate Applications**
- Slope drains may be used on construction sites where slopes may be eroded by surface runoff.
 - Drainage for top of slope dikes or swales.
 - Drainage for top of cut and fill slopes where water can accumulate.
 - Emergency spillway for a sediment basin.
- Limitations**
- Severe erosion may result when slope drains fail by overtopping, piping, or pipe separation.
 - Sediment accumulation, scour depressions, and/or persistent non-stormwater discharges in energy dissipaters associated with slope drain outlets can result in suitable areas for vector production.
- Standards and Specifications**
- Maximum slope generally limited to 2:1 (H:V), as energy dissipation below steeper slopes is difficult.
 - Direct surface runoff to slope drains with interceptor dikes. See BMP SS-8, “Earth Dikes/Drainage Swales, and Lined Ditches.”
 - Slope drains can be placed on or buried underneath the slope surface.
 - Recommended materials are plastic or corrugated metal, or comparable pipe.
 - When installing slope drains:
 - Install slope drains perpendicular to slope contours.

- Compact soil around and under entrance, outlet, and along length of pipe.
- Securely anchor and stabilize pipe and appurtenances into soil.
- Check to ensure that pipe connections are water tight.
- Protect area around inlet with filter cloth. Protect outlet with rock slope protection or other energy dissipation device. For high energy discharges, reinforce rock slope protection with concrete or use reinforced concrete device.
- Protect inlet and outlet of slope drains; use standard flared end section at entrance and exit for pipe slope drains 12 in and larger.

Maintenance and Inspection

- Inspect before, daily during and after each rain event, and weekly during the duration of the construction project. Inspect outlet for erosion and downstream scour.
- If eroded, repair damage and install additional energy dissipation measures. If downstream scour is occurring, it may be necessary to reduce flows being discharged into the channel.
- Inspect slope drainage for accumulations of debris and sediment.
- Remove built-up sediment from entrances, outlets, and within drains as required.
- Make sure stormwater is not ponding onto inappropriate areas (e.g., active traffic lanes, material storage areas, etc.).

SWPPP or WPCP

- Slope Drains must be discussed in Section 500.3.2 of SWPPP or Section 30.2 of the WPCP.

BMP Objectives	
Soil Stabilization	✓
Sediment Control	✓
Tracking Control	☐
Wind Erosion Control	☐
Non-Stormwater Management	☐
Materials and Waste Management	☐

- Definition and Purpose** Drainage systems including the stream channel, streambank, and associated riparian areas, are dynamic and sensitive ecosystems that respond to changes in land use activity. Streambank and channel disturbance resulting from construction activities can increase the stream’s sediment load, which can cause channel erosion or sedimentation and have adverse affects on the biotic system. BMPs can reduce the discharge of sediment and other pollutants and minimize the impact of construction activities on watercourses. Streams included on the 303(d) list by the State Water Resources Control Board (SWRCB) may require careful evaluation to prevent any increases in sedimentation, siltation and/or turbidity to the stream.
- Appropriate Applications** These procedures typically apply to all construction projects that disturb or occur within stream channels and their associated riparian areas. Streambank stabilization typically consists of a combination of several BMPs to prevent destabilization and enhance stability of eroding streambanks.
- Limitations** Specific permit requirements or mitigation measures such as Regional Water Quality Control Board (RWQCB) 401 Certification, U.S. Army Corps of Engineers 404 permit and approval by California Department of Fish and Wildlife Service may be included in contract documents. Specific requirements could include in-water work windows, vegetation species, seed mixes, stabilization measures, water quality monitoring protocols and specific reporting requirements. If numerical-based water quality standards are mentioned in any of these and other related permits, testing and sampling may be required. Streams included on the 303(d) list by the SWRCB because of sediment, silt, or turbidity impairment are required to conduct sampling to verify that there is no net increase in sediment load due to construction activities.
- Standards and Specifications** **PLANNING**
- Proper planning, design, and construction techniques can minimize impacts normally associated with in-stream construction activities. Poor planning can adversely affect soil, fish, and wildlife resources, land uses, or land users.

Planning should take into account: scheduling, avoidance of in-stream construction; minimizing disturbance area and construction time period; using pre-disturbed areas; selecting crossing location; selecting equipment and proper stabilization techniques once the activity is completed.

Scheduling (SS-1)

- Construction activities should be scheduled according to the relative sensitivity of the environmental concerns and in accordance with SS-1, “Scheduling.” Scheduling considerations will be different when working near perennial streams vs. ephemeral streams, and are as follows:
 - Construction work near perennial streams should optimally be performed during the dry season (see below).
 - When working in or near ephemeral, intermittent, or perennial streams, construction should be performed during the dry season and in accordance with regulatory agency permits and approvals. By their very nature, ephemeral and intermittent streams are usually dry in the summer, and therefore, in-stream construction activities will not cause significant water quality problems. For perennial streams, clear water diversion (see NS-5 for “Clear Water Diversion”), dewatering (see NS-2 for “Dewatering Operations”), and water quality monitoring may be required.
 - When closing the site at the end of the job, wash any fines that were formed in-situ back into the channel the bed material, to decrease pollution from the first rainstorm (“first flush”) of the season. When working near stream channels, erosion and sediment controls (see silt fences, straw bale barriers, etc.) should be implemented on the banks to keep sediment out of the stream channel.
 - Regulatory permits might require or allow for the stockpiling of native bed material to be backfilled during stabilization.

Minimize Disturbance

- Minimize disturbance through: selection of the narrowest crossing location; limiting the number of equipment trips across a stream during construction; and, minimizing the number and size of work areas (equipment staging areas and spoil storage areas). Provide stabilized access to the stream when in-stream work is required. Field reconnaissance should be conducted during the planning stage to identify work areas.
- Comply with regulatory permit requirements, if none are applicable, then place work areas (stage area, active construction) at least 50 ft from the stream channel. Perform each of the following activities at least 100 feet from a drainage course if it is performed within the floodplain, or at least 50 feet outside the floodplain: stockpiling materials, storing pile-driving equipment and liquid waste containers, washing vehicles and equipment, fueling and maintaining vehicles and equipment.
- Locate access and staging areas in paved or pre-disturbed areas when possible. If not possible, select access and staging areas that minimizes disturbance to aquatic species, riparian vegetation, and habitat.

- Avoid steep and unstable banks, highly erodible or saturated soils, or highly fractured rock, wherever possible.
- Select equipment that reduces the amount of pressure exerted on the ground surface, and therefore, reduces erosion potential and/or use overhead or aerial access for transporting equipment across drainage channels. Use equipment that exerts ground pressures of less than 5 or 6 pounds per square inch (PSI), where possible. Low ground pressure equipment includes: wide or high flotation tires (34 to 72 inch wide); dual tires; bogie axle systems; tracked machines; lightweight equipment; and central tire inflation systems.

STREAMBANK STABILIZATION

Preservation of Existing Vegetation (SS-2)

- Preserve existing vegetation in accordance with SS-2, “Preservation of Existing Vegetation.” In a streambank environment preservation of existing vegetation provides the following benefits:

Water Quality Protection

Vegetated buffers on slopes trap sediment and promote groundwater recharge. The buffer width needed to maintain water quality ranges from 15 to 100 feet. On gradual slopes, most of the filtering occurs within the first 30 feet of the buffer. Steeper slopes require a greater width of vegetative buffer to provide water quality benefits.

Streambank Stabilization

The root system of riparian vegetation stabilizes streambanks by increasing tensile strength in the soil. The presence of vegetation modifies the moisture condition of slopes (infiltration, evapotranspiration, interception) and increases bank stability.

Riparian Habitat

Buffers of diverse riparian vegetation provide food, shelter, and shade for riparian and aquatic organisms. Minimizing impacts to fisheries habitat is a major concern when working near streams and rivers. Riparian vegetation provides shade, shelter, organic matter (leaf detritus and large woody debris), and other nutrients that are necessary for fish and other aquatic organisms. Buffer widths for habitat concerns are typically wider than those recommended for water quality concerns (100 to 1,500 feet).

When working near watercourses, it is important to understand the work site’s placement in the watershed. Riparian vegetation in the headwater streams has a greater impact on overall water quality than vegetation in downstream reaches. Preserving existing vegetation in upstream areas is necessary to maintain water quality, minimize bank failure, and maximize riparian habitat downstream of the work site.

- Local county and municipal ordinances regarding width, extent and type of vegetative buffer required may exceed the specifications provided here; these ordinances should be investigated prior to construction.

- As a general rule, the width of a buffer strip between a road and the stream is recommended to be 50 feet plus four times the percent slope of the land, measured between the road and the top of stream bank.

Hydraulic Mulch (SS-3), Hydroseeding (SS-4), and Soil Binders (SS-5)

- Apply hydraulic mulch, hydroseed, or soil binders on disturbed streambanks above the mean high water level to provide temporary soil stabilization.
- Do not place hydraulic mulch, tackifiers, fertilizers, or soil binders below the mean high water level, as these materials could wash into the channel and impact water quality or possibly cause eutrophication.

Straw Mulch (SS-6)

- Apply straw mulch to disturbed streambanks in accordance with SS-6, “Straw Mulch.”
- Do not place straw mulch or tackifiers below the mean high water level, as this material could wash into the channel and impact water quality.

Temporary Cover and Rolled Erosion Control Products (SS-7)

- Install geosynthetics, rolled erosion control product, and plastic as described in SS-7, “Temporary Cover and Rolled Erosion Control Products” to stabilize disturbed channels and streambanks.
- Not all applications of SS-7 should be installed in a channel, for example, certain geotextile netting may snag fish gills and are not appropriate in fish-bearing streams. Geotextile fabrics that are not biodegradable are not appropriate for in-stream use. Additionally, geotextile fabric or blankets placed in channels must be adequate to sustain anticipated hydraulic forces.

Earth Dikes/Drainage Swales, and Lined Ditches (SS-9)

- Convey, intercept, or divert runoff from disturbed streambanks using SS-9, “Earth Dikes/Drainage Swales, and Lined Ditches.”
- Do not place earth dikes in watercourses, as these structures are only suited for intercepting sheet flow, and should not be used to intercept concentrated flow.

Outlet Protection/Velocity Dissipation Devices (SS-10)

- Place outlet protection or velocity dissipation devices at outlets of pipes, drains, culverts, slope drains, diversion ditches, swales, conduits or channels in accordance with SS-10.

Slope Drains (SS-11)

- Use slope drains to intercept and direct surface runoff or groundwater into a stabilized watercourse, trapping device or stabilized area in accordance with SS-11, “Slope Drains.” The use of slope drains minimizes potential streambank erosion from overland flows.

STREAMBANK SEDIMENT CONTROL

Silt Fences (SC-1)

- Install silt fences in accordance with SC-1, “Silt Fence” to control sediment. Silt fences should only be installed where sediment-laden water can pond, thus allowing the sediment to settle out.

Fiber Rolls (SC-5)

- Install fiber rolls in accordance with SC-5, “Fiber Rolls” along slope contour above the high water level to intercept runoff, reduce flow velocity, release the runoff as sheet flow and provide removal of sediment from the runoff. In a stream environment, fiber rolls should be used in conjunction with other sediment control methods such as SC-1, “Silt Fence” or SC-9, “Straw Bale Barrier.” Install silt fence, straw bale barrier, or other erosion control methods along the toe of slope above the high water level. Typical fiber roll installation is illustrated at the end of this Section.

Gravel Bag Berm (SC-6)

- A gravel bag berm or barrier can be utilized to intercept and slow the flow of sediment-laden sheet flow runoff in accordance with SC-6, “Gravel Bag Berm.” In a stream environment gravel bag barriers can allow sediment to settle from runoff before water leaves the construction site and can be used to isolate the work area from the stream. Gravel bag barriers are not recommended as a perimeter sediment control practice around streams.

Straw Bale Barrier (SC-9)

- Install straw bale barriers in accordance with SC-9, “Straw Bale Barrier” to control sediment. Straw bale barriers should only be installed where sediment-laden water can pond, thus allowing the sediment to settle out. Install a silt fence in accordance with SC-1, “Silt Fence” on the down-slope side of the straw bale barrier closest to stream channel to provide added sediment control.

Compost Sock (SC-08)

- Compost socks are a mesh sock containing compost that act as three dimensional, biodegradable structures that intercept and filter sheet flow. Compost socks can filter runoff, retain sediment, and reduce sheet flow velocities. Compost may be pre-seeded to assist in the establishment of vegetation. Compost socks may be used as either a temporary or permanent sediment control measure.

Inspection and Maintenance

- Inspect BMPs daily during construction.
- Maintain and repair BMPs.
- Remove accumulated sediment as necessary.

SWPPP or WPCP

- Streambank Stabilization must be discussed in Section 500.3.2 of the SWPPP or Section 30.2 of the WPCP.

This page intentionally left blank

Section 4

Temporary Sediment Control BMP

4.1 Temporary Sediment Controls

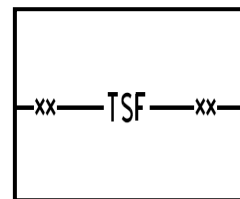

Temporary sediment control practices include those practices that intercept and slow or detain the flow of stormwater to allow sediment to settle and be trapped. These practices can consist of installing temporary linear sediment barriers (such as silt fences, sandbag barriers, and straw bale barriers); providing fiber rolls, gravel bag berms, or check dams to break up slope length or flow; or constructing a temporary sediment/desilting basin on sediment trap. Linear sediment barriers are typically placed below the toe of exposed and erodible slopes, downslope of exposed soil areas, around temporary stockpiles, and at other appropriate locations along the site perimeter.

Temporary sediment control practices must be implemented in conformance with the criteria presented in Section 2 of this Manual and the SWPPP/WPCP Preparation Manual. Temporary sediment control practices include the BMPs listed in Table 4-1.

ID	BMP Name
SC-1	Silt Fence
SC-2	Sediment/Desilting Basin
SC-3	Sediment Trap/Curb Cutback
SC-4	Check Dam
SC-5	Fiber Rolls
SC-6	Gravel Bag Berm/Earthen Berm
SC-7	Street Sweeping
SC-8	Sandbag Barrier
SC-9	Straw Bale Barrier
SC-10	Temporary Drainage Inlet Protection
SC-11	Compost Sock
SC-12	Flexible Sediment Barrier

The remainder of this Section describe the working details for each of the temporary sediment control BMPs.

This page intentionally left blank.

Standard Symbol

BMP Objectives	
Soil Stabilization	<input type="checkbox"/>
Sediment Control	<input checked="" type="checkbox"/>
Tracking Control	<input type="checkbox"/>
Wind Erosion Control	<input type="checkbox"/>
Non-Stormwater Management	<input type="checkbox"/>
Materials and Waste Management	<input type="checkbox"/>

Definition and Purpose A silt fence is a temporary linear sediment barrier of permeable fabric designed to intercept and slow the flow of sediment-laden sheet flow runoff. Silt fences allow sediment to settle from runoff before water leaves the construction site.

- Appropriate Applications**
- Below the toe of exposed and erodible slopes.
 - Down-slope of exposed soil areas.
 - Around temporary stockpiles.
 - Along streams and channels.
 - Along the perimeter of a project.

- Limitations**
- Not effective unless trenched and keyed in.
 - Not intended for use as mid-slope protection on slopes greater than 4:1 (H:V).
 - Must be maintained.
 - Must be removed and disposed of.
 - Don't use below slopes subject to creep, slumping, or landslides.
 - Don't use in streams, channels, drain inlets, or anywhere flow is concentrated.
 - Don't use silt fences to divert flow.
 - Don't use in locations where ponded water may cause a flooding hazard.

- Standards and Specifications**
- Design and Layout**
- The drainage area above any fence should not exceed a quarter of an acre, (100-feet of silt fence per 10,000 square feet of DSA).
 - Slope of area draining to silt fence should be less than 1:1 (H:V).
 - Silt fences must be placed parallel to the slope contour.

- Silt fences rely on temporary ponding to encourage sediment deposition and achieve water quality benefits. Limit application to areas where ponding and deposition may occur on the uphill side of the silt fence.
- Temporary silt fence fabrics generally have life spans ranging between five and eight months. Projects with longer durations may require replacing silt fence fabric.
- Silt fences constructed across concentrated flows are susceptible to washout. Silt fences shall not be installed across concentrated flows.
- For slopes adjacent to water bodies or Environmentally Sensitive Areas (ESAs), additional temporary soil stabilization BMPs should be used.
- For any 50 foot section of silt fence, the elevation of the base of the fence may not vary by more than 1/3 of the fence height.
- Install along a level contour, so water does not pond more than 1.5 ft at any point along the silt fence.
- Join separate sections to form reaches not more than 500 feet without openings. Ensure there are no gaps between posts.

Reinforced Silt Fence

- Temporary reinforced silt fence is typically used in areas affected by high winds. They are also often used on slopes steeper than 2:1 (H:V) that contain a high number of rocks or large dirt clods that tend to dislodge, or where area draining fence contains moderate sediment loads.
- Temporary reinforced silt fence (type 2) may also be used to provide sediment control and delineate ESAs.

Materials

- Silt fence fabric should be a woven or unwoven geosynthetic textile that complies with Section 96-1.02E of the Standard Specifications. The Contractor must submit a certificate of compliance for silt fence fabric in accordance with Standard Specifications Section 6-2.03C.
- Wood posts should be untreated fir, redwood, cedar, or pine lumber. Each silt fence post should be at least 4 feet long, except reinforced silt fence posts should be at least 6 feet for Type 1 and 5 feet for Type 2 installations. Posts should be free from decay, splits or cracks longer than the thickness of the post or other defects that would weaken the posts and cause the posts to be structurally unsuitable. Steel posts may be used as well. Posts should comply with the requirements in Standard Specifications sections 16-2.03B and 13-10.02C.
- Anchors may be used. Anchors consist of a number 4 steel reinforcing bar. End protection shall be provided for any exposed bar reinforcement.
- Staples used to fasten the fence fabric to the posts and to join adjacent silt fence sections shall be U-shaped and have 1/2-inch legs and a 1-inch crown.

Staples should be 1/16-inch in diameter. At least four staples should be installed on each silt fence post for adequate fastening, with a maximum of 8-inches between each staple.

Installation

- Install in accordance with Pages 5 and 6 of this BMP (Standard Plans T51 “Temporary Silt Fence” and T60 “Temporary Reinforced Silt Fence”).
- Generally, silt fences should be used in conjunction with soil stabilization source controls up slope to provide effective erosion and sediment control.
- Excavate a trench that is 6-inches deep and 6-inches wide with a length consistent with the project design plans. Place the bottom of the silt fence fabric in the trench. Backfill the trench with soil over the base of the silt fence fabric. Compact the backfill soil by hand or mechanical methods.
- Construct the length of each reach so that the change in base elevation along any 50-foot reach does not exceed 1/3 the height of the barrier; in no case should any reach of temporary silt fence exceed 500 feet in length.
- Construct silt fences with a set-back of at least 3 feet from the toe of a slope. Where a silt fence is determined to be not practical with a 3 foot set-back from the toe due to specific site conditions, the silt fence may be constructed at the toe of the slope, but should be constructed as far from the toe of the slope as practical.

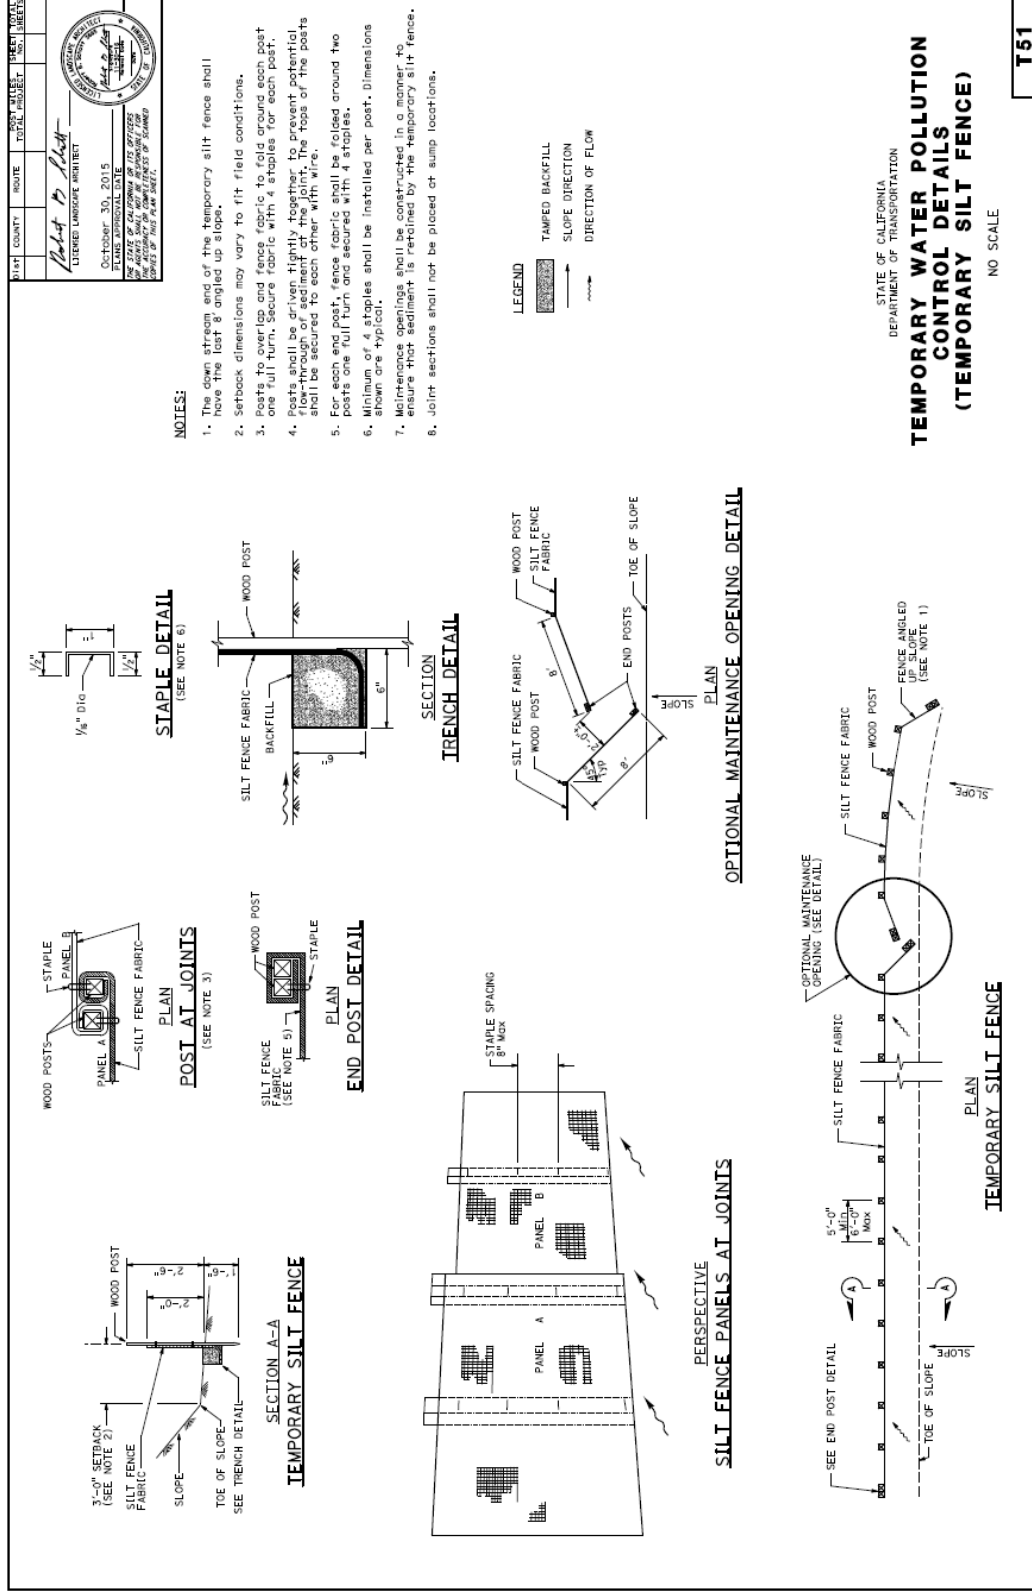

Maintenance and Inspection

- Repair undercut silt fences.
- Repair or replace split, torn, slumping, or weathered fabric.
- Inspect silt fence when rain is forecast. Perform necessary maintenance, or maintenance required by the Engineer.
- Inspect silt fence following rain events. Perform maintenance as necessary, or as required by the Engineer.
- Maintain silt fences to provide an adequate sediment holding capacity. Sediment should be removed when the sediment accumulation reaches one-third (1/3) of the barrier height.
- Silt fences that are damaged and become unsuitable for the intended purpose should be removed from the site of work, disposed of outside the highway right-of-way in conformance with the Standard Specifications, and replaced with new silt fence barriers.
- Holes, depressions or other ground disturbance caused by the removal of the temporary silt fences should be backfilled and repaired in conformance with the Standard Specifications.
- Remove silt fence when no longer needed. Fill and compact post holes and anchorage trench, remove sediment accumulation, and grade fence alignment to blend with adjacent ground.
- Silt Fence placement is to be shown in the WPCDs along with other BMPs.

- SWPPP or WPCP Temporary Silt Fence or Reinforced Silt Fence must be discussed in Section 500.3.3 of the SWPPP or Section 30.2.2 of the WPCP.

BMP Objectives	
Soil Stabilization	<input type="checkbox"/>
Sediment Control	<input checked="" type="checkbox"/>
Tracking Control	<input type="checkbox"/>
Wind Erosion Control	<input type="checkbox"/>
Non-Stormwater Management	<input type="checkbox"/>
Materials and Waste Management	<input type="checkbox"/>

Definition and Purpose A sediment/desilting basin is a temporary basin formed by excavating and/or constructing an embankment so that sediment-laden runoff is temporarily detained under quiescent conditions, allowing sediment to settle out before the runoff is discharged (refer to Figures 1 through 4).

Appropriate Applications Sediment basins shall be designed in accordance with the State of California NPDES General Permit for Storm Water Discharges Associated with Construction Activities (CGP). If there is insufficient area to construct a sediment basin in accordance with the CGP requirements, then the alternate desilting design standards specified herein may be used as approved by the RE.

Sediment/Desilting Basins should be considered for use:

- On construction projects with disturbed areas during the wetter months, typically October through May.
- Where sediment-laden water may enter the drainage system or watercourses.
- At drainage outlets of disturbed soil areas with areas between 5 and 10 ac.

Limitations

- Alternative BMPs must be thoroughly investigated for erosion control before selecting temporary sediment/desilting basins.
- Requires large surface areas to permit settling of sediment.
- Size may be limited by availability of right-of-way.
- Not appropriate for drainage areas greater than 75 ac.
- Not to be located in live streams.
- For safety reasons, basins should have protective fencing.
- Not to be used as a standalone BMP, requires proper BMP implementation upstream and downstream of its location.

Standards and Specifications **General Requirements**

- Sediment basins should be designed in accordance with the methods referenced in the State of California NPDES General Permit for Storm Water Discharges Associated with Construction Activities (CGP).
- Areas under embankments, structural works, and sediment basin must be cleared, stripped of vegetation in accordance with Standard Specifications Section 16 – “Temporary Facilities.”
- Earthwork should be in accordance with Standard Specifications Section 19 – “Earthwork.” Contractor is specifically directed to Standard Specifications Sections 19-5, “Compaction,” and 19-6, “Embankment Construction.”
- Chain link fencing should be provided around each sediment basin to prevent unauthorized entry to the basin or if safety is a concern. Fencing should be in accordance with Standard Specifications Section 80 – “Fences.”
- This BMP may be implemented on a project-by-project basis with other BMPs when determined necessary and feasible by the RE.
- The outflow from the basins must have outlet protection to prevent erosion and scouring of the embankment and channel. See BMP SS-10, “Outlet Protection/Velocity Dissipation Devices.”
- Avoid dewatering of groundwater to the sediment basin during the wetter months. Insignificant quantities of accumulated precipitation may be dewatered to the sediment basin unless precipitation is forecasted within 24 hours. Refer to NS-2 “Dewatering Operations.”

Other Considerations

- Basin should be located: (1) by excavating a suitable area or where a low embankment can be constructed across a swale, (2) where post-construction (permanent) detention basins will be constructed, (3) where failure would not cause loss of life or property damage, (4) where the basins can be maintained on a year-round basis to provide access for maintenance, including sediment removal and sediment stockpiling in a protected area, and to maintain the basin to provide the required capacity.
- Construct sediment basins prior to the rainy season and construction activities.
- Sediment basins, regardless of size and storage volume, should include features to accommodate overflow or bypass flows that exceed the design storm event. The calculated basin volume and proposed location should be submitted to the RE for approval at least 3 days prior to the basin construction.
- Construct an emergency spillway to accommodate flows not carried by the principal spillway. Spillway should consist of an open channel (earthen or vegetated) over undisturbed material (not fill) or constructed of a non-erodible rock slope protection.
- The spillway control section, which is a level portion of the spillway channel at the highest elevation in the channel, should be a minimum of 20 ft in length.

- Limit the contributing area to the sediment basin to only the runoff from disturbed soil areas. Use temporary concentrated flow conveyance controls to divert runoff from undisturbed areas away from the sediment basin.
- A forebay, constructed upstream of the basin may be provided to allow debris and larger particles to settle out of suspension before entering the basin.
- Basin inlets should be located to maximize travel distance to the basin outlet and resulting sediment deposition benefits.
- Rock or vegetation should be used to protect the basin inlet and slopes against erosion.
- The outlet structure should be placed on a firm, smooth foundation with the base securely anchored with concrete or other means to prevent floatation.
- Discharge from the basin should be accomplished through a water quality outlet. An example is shown in Figure 3. The principal outlet should consist of a corrugated metal, high density polyethylene (HDPE), or reinforced concrete riser pipe with dewatering holes and an anti-vortex device and trash rack attached to the top of the riser, to prevent floating debris from flowing out of the basin or obstructing the system. This principal structure should be designed to accommodate the inflow design storm.
- A rock pile or rock-filled gabions can serve as alternatives to the debris screen, although the designer should be aware of the potential for extra maintenance involved should the pore spaces in the rock pile clog.
- Proper hydraulic design of the outlet is critical to achieving the desired performance of the basin. The water quality outlet should be designed to drain the basin within 24 to 96 hours (also referred to as “drawdown time”). (The 24-hour limit is specified to provide adequate settling time; the 96-hour limit is specified to avoid vector control concerns). Local agencies may have more stringent drawdown time requirements.
- The two most common outlet problems that occur are: (1) the capacity of the outlet is too great resulting in only partial filling of the basin and drawdown time less than designed for; and (2) the outlet clogs because it is not adequately protected against trash and debris. To avoid these problems, the following outlet types are recommended for use: (1) a single orifice outlet with or without the protection of a riser pipe, and (2) perforated riser. Design guidance for single orifice and perforated riser outlets are as follows:

Flow Control Using a Single Orifice At The Bottom Of The Basin

(Figure 1). The outlet control orifice should be sized using the following equation:

$$a = \frac{2A(H - H_o)^{0.5}}{3600CT(2g)^{0.5}} = \frac{(7 \times 10^{-5})A(H - H_o)^{0.5}}{CT} \quad (\text{Eq. 2})$$

Where:

a = area of orifice (ft²) (1 ft² = 0.0929m²)

A = surface area of the basin at mid elevation (ft²)

C = orifice coefficient

T = drawdown time of full basin (hrs)

G = gravity (32.2 ft/s²)

H = elevation when the basin is full (ft)

H_o = final elevation when basin is empty (ft)

With a drawdown time of 40 hours, the equation becomes:

$$a = \frac{(1.75 \times 10^{-6})A(H - H_o)^{0.5}}{C} \quad (\text{Eq. 3})$$

Flow Control Using Multiple Orifices (see Figure2):

$$a_t = \frac{2A(h_{\max})}{CT(2g[h_{\max} - h_{\text{centroid of orifices}}])^{0.5}} \quad (\text{Eq. 4})$$

With terms as described above except:

a_t = total area of orifices

h_{\max} = maximum height from lowest orifice to the maximum water surface (ft)

$h_{\text{centroid of orifices}}$ = height from the lowest orifice to the centroid of the orifice configuration (ft)

Allocate the orifices evenly on two rows; separate the holes by 3x hole diameter vertically, and by 120 degrees horizontally (refer to Figure 3).

Because basins are not maintained for infiltration, water loss by infiltration should be disregarded when designing the hydraulic capacity of the outlet structure.

Care must be taken in the selection of "C"; 0.60 is most often recommended and used. However, based on actual tests, GKY (1989), "Outlet Hydraulics of Extended Detention Facilities for Northern Virginia Planning District Commission", recommends the following:

$C = 0.66$ for thin materials; where the thickness is equal to or less than the orifice diameter, or

$C = 0.80$ when the material is thicker than the orifice diameter

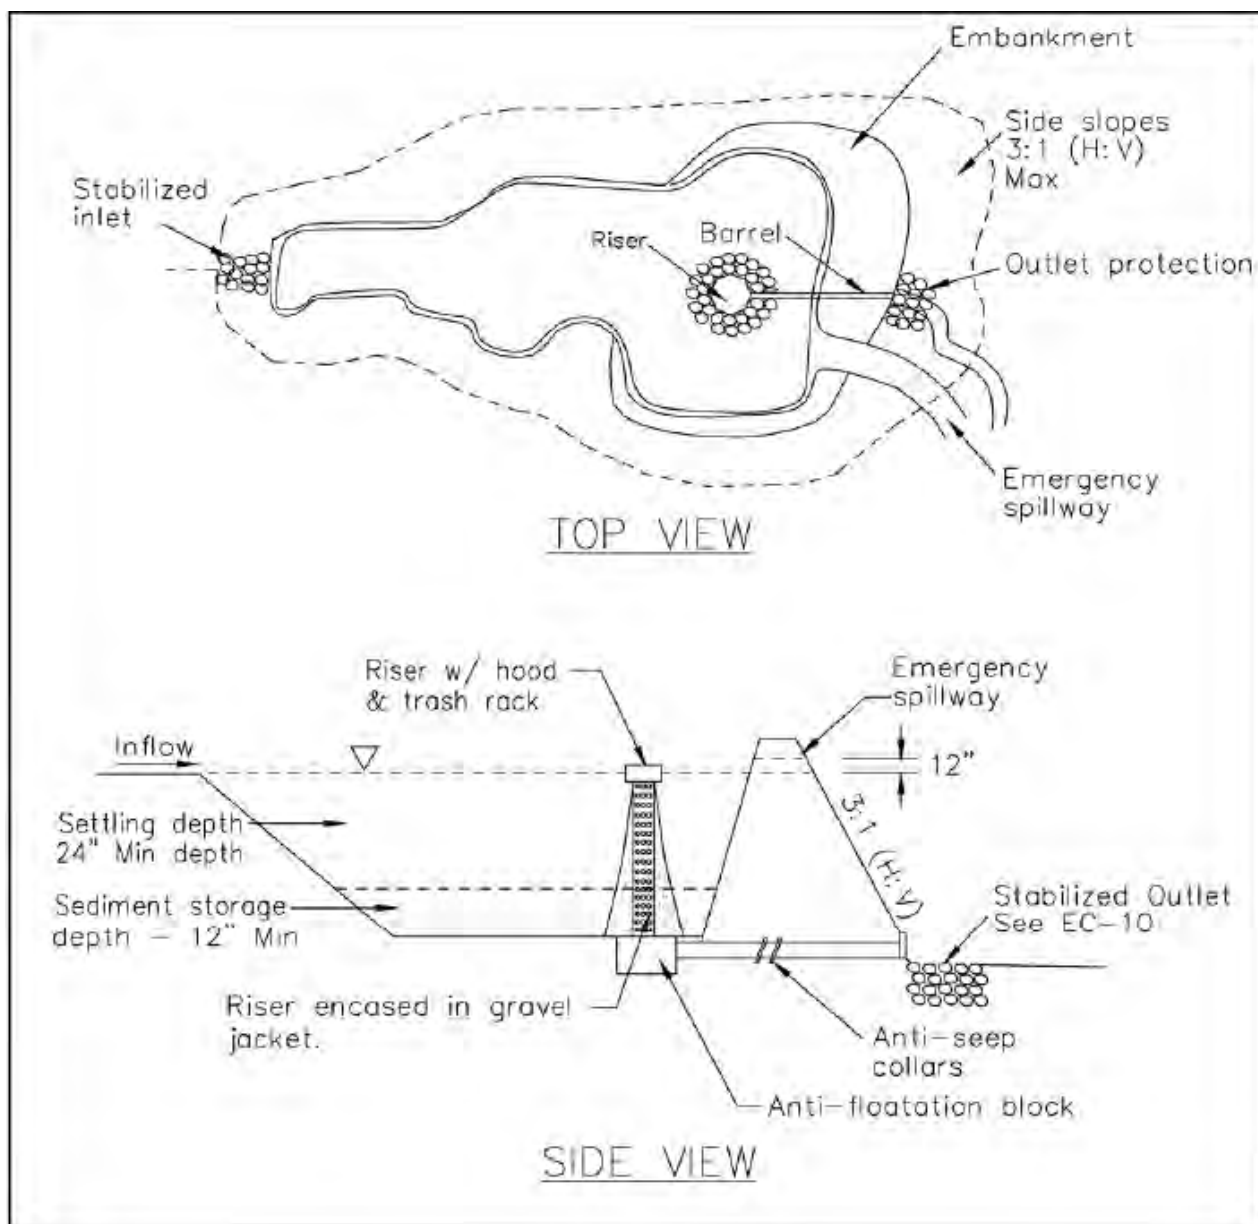

- The Contractor should verify that the outlet is properly designed to handle the design and peak flows.
- If rock is used for energy dissipation or to prevent erosion, it must comply with Highway Design Manual Chapter 860.
- Attach riser pipe (watertight connection) to a horizontal pipe (barrel), which extends through the embankment to toe of fill. Provide anti-seep collars on the barrel.
- Cleanout level should be clearly marked on the riser pipe.
- Basins with an impounding levee greater than 5 ft tall, measured from the lowest point to the impounding area to the highest point of the levee, and basins capable of impounding more than 35,300 cubic feet, should be designed by a professional Civil Engineer registered with the state of California. The design must be submitted to the RE for approval at least 7 days prior to the basin construction. The design should include maintenance requirements, including sediment and vegetation removal, to ensure continuous function of the basin outlet and bypass structures.

Maintenance and Inspection

- Inspect sediment basins before and after rainfall events and weekly year round. During extended rainfall events, inspect at least every 24 hours.
- Examine basin banks for seepage and structural soundness.
- Check inlet and outlet structures and spillway for any damage or obstructions. Repair damage and remove obstructions as needed.
- Remove standing water from the basin within 72 hours after accumulation.
- Check inlet and outlet area for erosion and stabilize if required.
- Remove accumulated sediment when its volume reaches one-third the volume of the sediment storage. Properly dispose of sediment and debris removed from the basin.
- Check fencing for damage and repair.

SWPPP or WPCP

- Sediment/Desilting Basin must be discussed in Section 500.3.3 of the SWPPP or Section 30.2.2 of the WPCP.

Temporary Sediment Trap/Curb Cutback

SC-3

Standard Symbol

BMP Objectives	
Soil Stabilization	<input type="checkbox"/>
Sediment Control	<input checked="" type="checkbox"/>
Tracking Control	<input type="checkbox"/>
Wind Erosion Control	<input type="checkbox"/>
Non-Stormwater Management	<input type="checkbox"/>
Materials and Waste Management	<input type="checkbox"/>

Definition and Purpose

A sediment trap/curb cutback is a temporary containment area that allows sediment in collected storm water to settle out during infiltration or before the runoff is discharged through a stabilized spillway. Sediment traps are formed by excavating or constructing an earthen embankment.

Curb cutback is implemented when the construction project utilizes the removed section of pavement and uses the depression of the curb as a temporary containment to collect sediment before reaching a storm drain.

Appropriate Applications

- Sediment traps may be used on construction projects where the drainage area is less than 5 ac. Traps should be placed where sediment-laden stormwater enters a storm drain or watercourse.
- As a supplemental control, sediment traps provide additional protection for a water body or for reducing sediment before it enters a drainage system.

Limitations

- Requires large surface areas to permit infiltration and settling of sediment.
- Size may be limited by availability of right-of-way.
- Not appropriate for drainage areas greater than 5 ac.
- Only removes large and medium sized particles and requires upstream erosion control.
- Sediment traps may appear attractive and dangerous to children, requiring protective fencing.
- Sediment traps should not to be located in live streams.
- Curb cutback typically does not allow for a large storage area and therefore requires frequent maintenance to prevent sediment laden discharges.

Temporary Sediment Trap/Curb Cutback

SC-3

Standards and Specifications

General Requirements

- Areas under embankments, structural works, and sediment traps must be cleared and stripped of vegetation in accordance with Standard Specifications Section 17-2 – “Clearing and Grubbing.”
- Earthwork must be in accordance with Standard Specifications Section 19 – “Earthwork”. Contractor is specifically directed to Standard Specifications Sections 19-5 and 19-6 entitled, “Compaction” and “Embankment Construction,” respectively.
- Fencing, in accordance with Standard Specifications Section 80 – “Fences,” should be provided to prevent unauthorized entry.
- Remove and dispose of deposited solids from sediment traps under Standard Specifications Section 14-10 – “Solid Waste Disposal and Recycling,” unless another method is authorized.
- This BMP may be implemented on a project-by-project basis with other BMPs when determined necessary and feasible by the RE.
- The outflow from sediment traps may be provided with outlet protection to prevent erosion and scouring of the embankment and channel. See BMP SS-10, “Outlet Protection/Velocity Dissipation Devices.”
- For curb cutback, excavate soil from behind the curb, sidewalk, or roadway at least 3-4 inches down from the top of the hardscape and bring the soil back at a minimum 3-4 feet back from the hardscape. Site conditions might allow for increase in capacity.

Other Considerations

- The sediment trap should be situated according to the following criteria: (1) by excavating a suitable area or where a low embankment can be constructed across a swale, (2) where failure would not cause loss of life or property damage, and (3) to provide access for maintenance, including sediment removal and sediment stockpiling in a protected area.
- Sediment traps should be sized to accommodate a settling zone and sediment storage zone with recommended minimum volumes of 67 yd³/ac and 33 yd³/ac of contributing drainage area, respectively, based on 0.5 inch of runoff volume over a 24-hour period. Multiple traps and/or additional volume may be required to accommodate site specific rainfall and soil conditions.
- Use rock or vegetation to protect the trap outlets against erosion.
- Traps with an impounding levee greater than 4.5 ft tall, measured from the lowest point to the impounding area to the highest point of the levee, and traps capable of impounding more than 35,000 cubic feet, must be designed by a Civil Engineer registered with the state of California. The design must be submitted to the RE for approval at least 7 days prior to the basin construction. The design should include maintenance requirements to ensure continuous function of the trap outlet and bypass structures.

Wind Erosion Control	<input type="checkbox"/>
Non-Stormwater Management	<input type="checkbox"/>
Materials and Waste Management	<input type="checkbox"/>

Definition and Purpose Temporary check dams reduce scour and channel erosion by reducing flow velocity and encouraging sediment settlement. A check dam is a small device constructed of rock, gravel bags, compost socks, fiber rolls, or other proprietary product placed across a natural or man-made channel or drainage ditch.

- Appropriate Applications**
- Check dams may be installed:
 - In small open channels that drain 10 ac or less.
 - In steep channels where storm water runoff velocities exceed 5 ft/sec.
 - During the establishment of grass linings in drainage ditches or channels.
 - In temporary ditches where the short length of service does not warrant establishment of erosion-resistant linings.

- Limitations**
- This BMP may be implemented on a project-by-project basis with other BMPs when determined necessary and feasible by the RE.
 - Not to be used in live streams.
 - Not appropriate in channels that drain areas greater than 10 ac.
 - Not to be placed in channels that are already grass lined unless erosion is expected, as installation may damage vegetation.
 - Require extensive maintenance following high velocity flows.
 - Promotes sediment trapping, which can be re-suspended during subsequent storms or removal of the check dam.
 - Not to be constructed from straw bales or silt fence.

Standards and Specifications

General Requirements

- Remove obstructions, rocks, clods, and debris greater than 1 inch in diameter from the ground before installing temporary check dams.
- If check dams are used in combination with Rolled Erosion Control Product (RECP) or blanket, install the RECP or blanket first.
- Place a temporary check dam perpendicular to the centerline of the ditch or drainage line.
- Install the check dam with enough spillway depth to prevent flanking of a concentrated flow around its ends.
- Type 1 or Type 2 check dams are appropriate for unlined ditches. Type 2 check dams are appropriate if the ditch is concrete lined.

Fiber Roll (Type 1) Check Dam

Refer to SC-5 “Fiber Rolls.”

- Secure the fiber rolls with rope and notched wood stakes.
- Drive the stakes into the soil until the notch is even with the top of the fiber roll.
- Lace rope between the stakes and over the fiber roll. Knot the rope at each stake.
- Tighten by driving the stakes further into the soil and forcing the fiber roll against the surface of the ditch or drainage line.

Gravel-filled Bag (Type 2) Check Dam

Bag Material: Bags are a geosynthetic material, either polypropylene, polyethylene or polyamide woven fabric, minimum unit weight 4 ounces per yd², mullen burst strength exceeding 300 psi in conformance with the requirements in ASTM designation D3786, and ultraviolet stability exceeding 70% in conformance with the requirements in ASTM designation D4355.

Bag Size: Each gravel-filled bag shall have a length of 24 in to 32 in, width of 16 in to 20 in, and thickness of 3 in. Alternative bag sizes must be submitted to the RE for approval prior to deployment.

Gravel: Fill material is between 3/8 and 3/4 inch in diameter, and must be clean and free from clay balls, organic matter, and other deleterious materials. The opening of gravel-filled bags should be secured such that gravel does not escape. Gravel-filled bags are between 30 and 50 lb in weight. Fill material is subject to approval by the RE.

- Place a Type 2 temporary check dam as a single layer of gravel-filled bags, placed end-to-end to eliminate gaps.
- If you need to increase the height of the dam, add more layers of gravel-filled bags. Stack the bags in the upper row to overlap the joints in the lower row. Stabilize the rows by adding more rows of bags in the lower layers.

- Tightly abut bags and stack gravel bags using a pyramid approach. Gravel bags should not be stacked any higher than 3 ft.
- Upper rows of gravel bags should overlap joints in lower rows.

Other Considerations

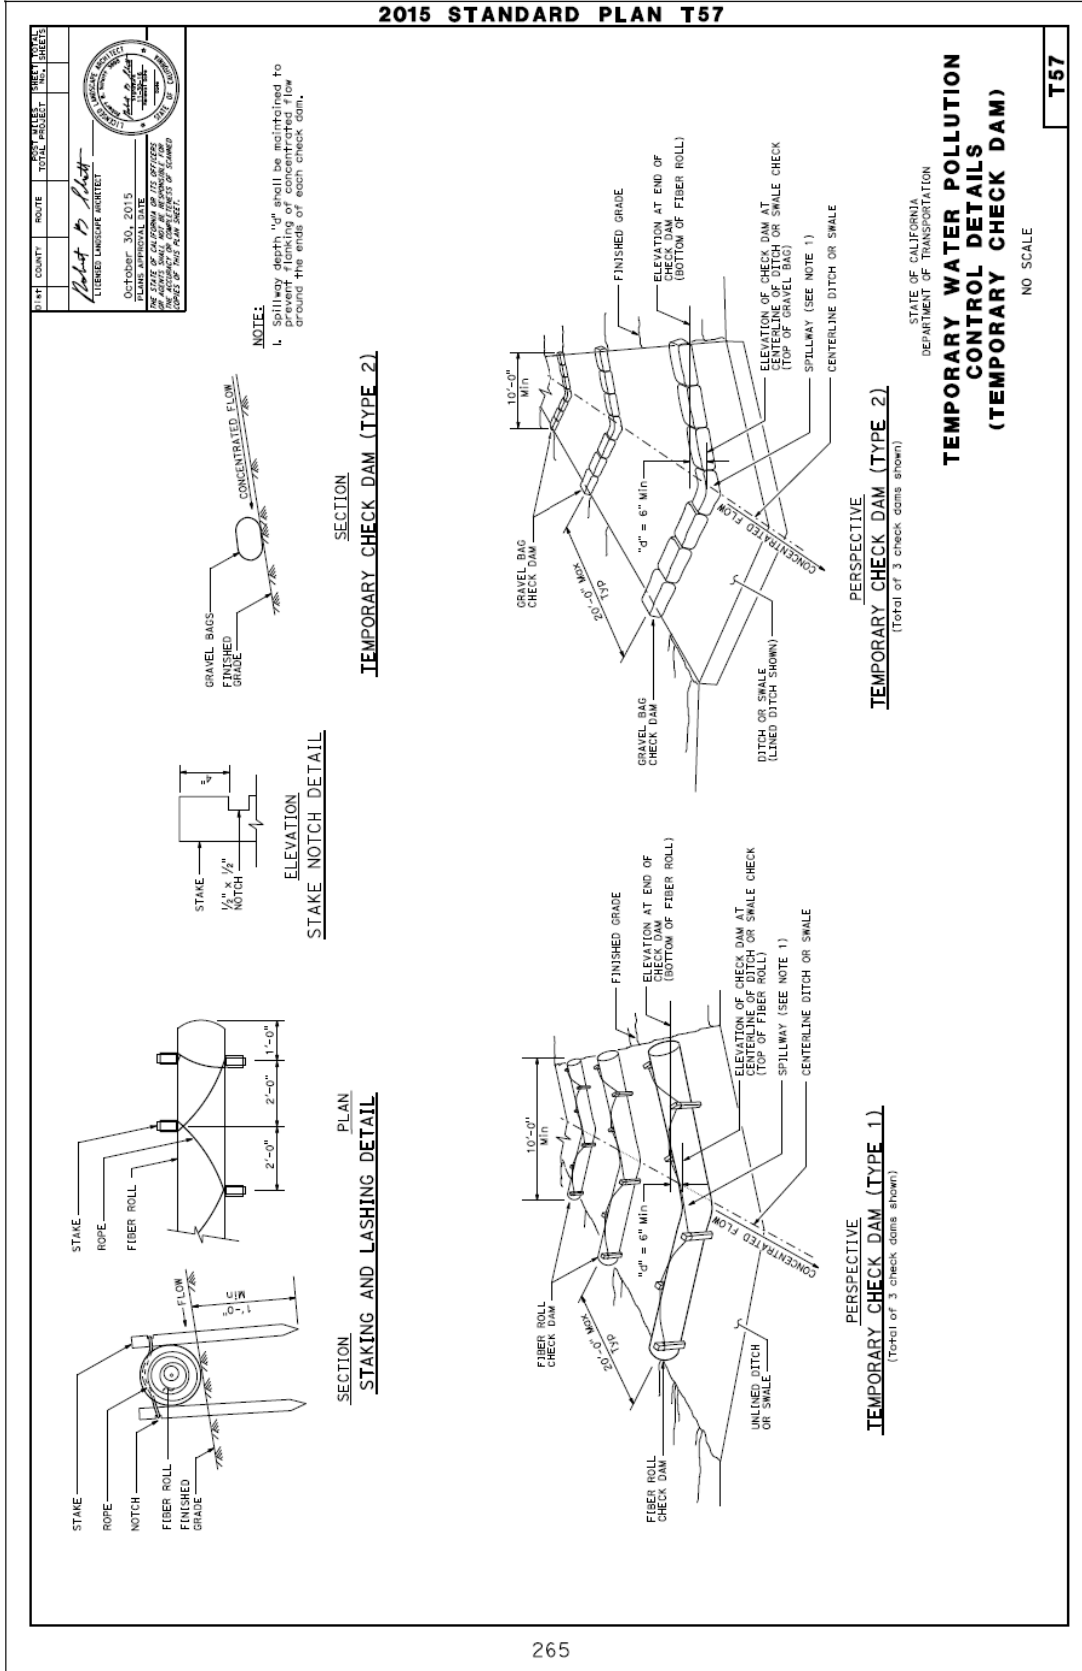

- Check dams should be placed at a distance and height to allow small pools to form behind them. Install the first check dam approximately 15 ft from the outfall device and at regular intervals based on slope gradient and soil type.
- For multiple check dam installation, backwater from downstream check dam should reach the toe of the upstream dam.
- High flows (typically a 2-year storm or larger) should safely flow over the check dam without an increase in upstream flooding or damage to the check dam.
- Where grass is used to line ditches, check dams should be removed when grass has matured sufficiently to protect the ditch or swale from erosion.
- Check dam materials should consist of biodegradable materials whenever feasible.
- Rock check dams might be more applicable if concentrated flows might be a potential.

Maintenance and Inspection

- Check dams must be inspected at a minimum weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Replace missing rock, bags, fiber rolls, etc. that have degraded or become damaged.
- Remove sediment when depth reaches one-third of the check dam height.
- Remove accumulated sediment prior to permanent seeding or soil stabilization.
- Remove check dam and accumulated sediment when check dams are no longer needed or when directed by the RE.
- Removed sediment can be incorporated in the project at locations designated by the RE or disposed of outside the highway right-of-way in conformance with the Standard Specifications.

SWPPP or WPCP

- Temporary Check Dams must be discussed in Section 500.3.3 of the SWPPP or Section 30.2.2 of the WPCP.

Definition and Purpose A fiber roll consists of wood excelsior, rice or wheat straw, or coconut fibers that is rolled or bound into a tight tubular roll and placed on the toe and face of slopes to intercept runoff, reduce its flow velocity, release the runoff as sheet flow and provide removal of sediment from the runoff. Fiber rolls may also be used for drainage inlet protection and as check dams under certain situations.

- Appropriate Applications**
- This BMP may be implemented on a project-by-project basis with other BMPs when determined necessary and feasible by the RE.
 - Fiber rolls may be applied as both temporary and permanent sediment controls.
 - Along the toe, top, face, and at grade breaks of exposed and erodible slopes to shorten slope length and spread runoff as sheet flow.
 - Below the toe of exposed and erodible slopes.
 - Fiber rolls may be used as check dams in unlined ditches or as temporary drainage inlet protection Down-slope of exposed soil areas.
 - Around temporary stockpiles.
 - Along the perimeter of a project.

- Limitations**
- Runoff and erosion may occur if fiber roll is not adequately trenched in.
 - Fiber rolls at the toe of slopes greater than 5:1 (H:V) may require the use of a large sediment barrier as specified in Standard Specifications Section 13-10.03D Temporary Large Sediment Barrier or installations achieving the same protection (i.e., stacked smaller diameter fiber rolls, etc.).
 - Difficult to move once saturated.

- Fiber rolls could be transported by high flows if not properly staked and trenched in.
- Fiber rolls have limited sediment capture zone.
- Do not use fiber rolls on slopes subject to creep, slumping, or landslide.
- Plastic netting should not be used when regulatory permits prohibit their use or if there is a potential for plastic netting to endanger wildlife.
- Plastic netting is only allowed where fiber rolls will be for short duration and will be removed.

Standards and Specifications

Materials

- Fiber rolls must be premanufactured and filled with weed-free rice or wheat straw, wood excelsior, or coconut fiber. Fiber roll must be covered with biodegradable jute, sisal, or coir fiber netting secured tightly at each end.
- Fiber rolls must have a minimum functional longevity of 1 year.
- Fiber rolls must be:
 - 8 to 10 inches in diameter and at least 1.1 lb/ft
 - 10 to 12 inches in diameter and at least 3 lb/ft
- Large sediment barriers are a subset of fiber rolls. Large sediment barriers must be:
 - 18 to 22 inches in diameter
 - At least 8 ft in length
 - At least 6.5 lb/ft
- Fiber rolls used within the jurisdiction of the Lahontan RWQCB must be made entirely of biodegradable materials if the project is near an ESA area, they are intended to be left in place after construction is completed or there are regulatory permits prohibiting the use of non-photo/biodegradable fiber rolls.
- Submit a Certificate of Compliance for fiber rolls.
- Rope to fasten fiber rolls must be 1/4 inch in diameter and biodegradable, such as sisal or manila.
- Wood stakes must be untreated fir, redwood, cedar, or pine and cut from sound timber. The ends must be pointed for driving into the ground. Notched stakes must be at least 1 by 2 by 24 inches in size. Stakes without notches must be at least 1 by 1 by 24 inches.

Typical Fiber Roll Installation

- Before installing fiber roll, remove obstructions from the ground, including rocks, clods, and debris greater than 1 inch in diameter.
- For any 20-foot section of fiber roll, prevent the fiber roll from varying more than 5 percent from level.
- Use the following spacing unless otherwise noted on the project plans or special provisions:
 - 10 feet apart for slopes steeper than 2:1 (H:V)
 - 15 feet apart for slopes from 2:1 to 4:1 (H:V)
 - 20 feet apart for slopes from 4:1 to 10:1 (H:V)
 - 50 feet apart for slopes flatter than 10:1 (H:V)
- For Type 1 installations:
 - Place in a furrow that is from 2 to 4 inches deep.
 - Fasten with wood stakes every 4 feet along the length of the fiber roll.
 - Fasten the ends of the fiber roll by placing a stake 6 inches from the end of the roll.
 - Drive the stakes into the soil so the top of the stake is less than 2 inches above the top of the fiber roll.
- For Type 2 installations:
 - Fasten with notched wood stakes and rope.
 - Drive stakes into the soil until the notch is even with the top of the fiber roll.
 - Lace the rope between stakes and over the fiber roll. Knot the rope at each stake.
 - Tighten the fiber roll to the surface of the slope by driving the stakes further into the soil.
- If more than one fiber roll is placed in a row, the rolls should be overlapped; not abutted. Stagger overlapping joints in adjacent rows by 5 to 10 feet.

Typical Large Sediment Barrier Installation

- Place a single row of fiber rolls end-to-end, approximately parallel with the slope contour. For any 20-foot section of fiber roll, do not allow the fiber roll to vary by more than 5 percent from level.
- Place the fiber rolls in a furrow that is from 6 to 8 inches deep.
- Secure the fiber rolls with wood stakes 4 feet apart.
- Place a stake 18 inches from each end of each fiber roll.

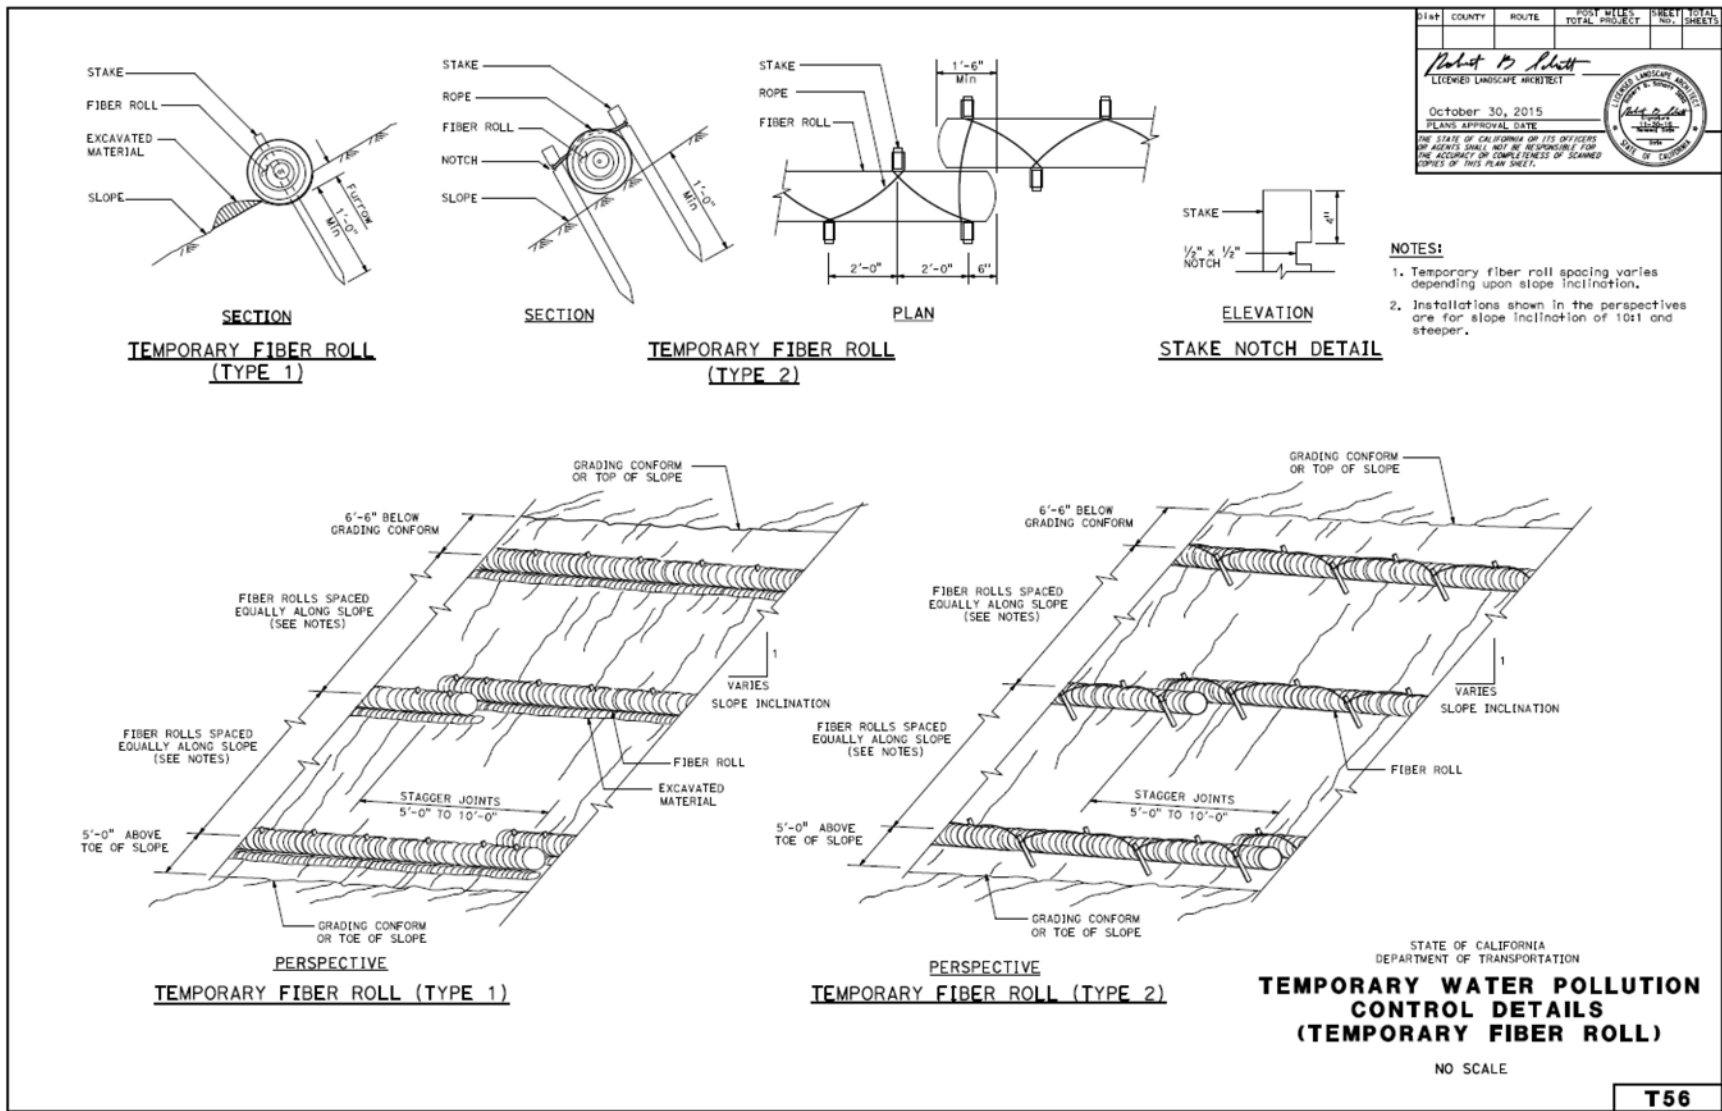

- Drive the stakes into the soil such that the top of the stakes are less than 2 inches above the top of the fiber rolls.
- Angle the last 6 feet upslope at the downhill end of the run.

Removal

- For permanent installations, do not remove fiber rolls. Fiber rolls will degrade over time, while underlying soils are stabilized by other BMPs.
 - For temporary installations, remove fiber rolls, collect and dispose of sediment accumulation, and fill and compact holes, trenches, depressions or any other ground disturbance to blend with adjacent ground.
- Maintenance and Inspection
- Remove sediment from behind the fiber roll if sediment is 1/3 of fiber roll height above ground.
 - Repair or adjust the fiber roll if rills or other evidence of concentrated runoff occur beneath the fiber roll.
 - Repair or replace the fiber roll if they become split, torn, or unraveled.
 - Add stakes if the fiber roll slumps or sags.
 - Replace broken or split wood stakes.
 - Remove sediment deposits, trash, and debris from fiber roll as needed. If removed sediment is deposited within project limits, it must be stabilized and not exposed to erosion by wind or water.
 - Perform maintenance as needed or as required by the RE or CGP or LTCGP requirements.
 - Inspect fiber rolls before and following rainfall events and at least daily during prolonged rainfall. Perform maintenance as needed or as required by the RE.
 - Maintain fiber rolls to provide an adequate sediment holding capacity and runoff velocity reduction.
 - Fiber roll placement must be shown on the WPCDs
- SWPPP or WPCP
- Fiber rolls must be discussed in Section 500.3 of the SWPPP or Section 30.2 of the WPCP.

Definition and Purpose

A gravel bag berm consists of a single row of gravel bags that are installed end to end to form a barrier across a slope to intercept runoff, reduce its flow velocity, release the runoff as sheet flow and provide some sediment removal. Gravel bags can be used where flows are moderately concentrated, such as ditches, swales, and storm drain inlets (see SC-10 “Drainage Inlet Protection”) to divert and/or detain flows.

Earthen berms are linear sediment barriers designed to intercept sheet flows. Water gets impounded upstream of the earthen berm, allowing sediment to settle out and releasing runoff as sheet flow, preventing erosion.

Appropriate Applications

- BMP may be implemented on a project-by-project basis with other BMPs when determined necessary and feasible by the RE.
- Along streams and channels.
- Below the toe of exposed and erodible slopes.
- Down slope of exposed soil areas.
- Around stockpiles.
- Across channels to serve as a barrier for utility trenches or provide a temporary channel crossing for construction equipment, to reduce stream impacts.
- Parallel to a roadway to keep sediment off paved areas.
- At the top of slopes to divert roadway runoff away from disturbed slopes.
- Along the perimeter of a site.
- To divert or direct flow or create a temporary sediment basin.

- During construction activities in stream beds when the contributing drainage area is less than 5 ac.
- When extended construction period limits the use of either silt fences or straw bale barriers.
- When site conditions or construction sequencing require adjustments or relocation of the barrier to meet changing field conditions and needs during construction.
- At grade breaks of exposed and erodible slopes to shorten slope length and spread runoff as sheet flow.

Limitations

- Degraded gravel bags may rupture when removed, spilling contents.
- Installation can be labor intensive.
- Limited durability for long term projects.
- When used to detain concentrated flows, maintenance requirements increase.
- Earthen berms should not be used to intercept flows with moderate to high velocities that may erode the earthen berm.
- Earthen berms are susceptible to erosion from concentrated flows.

Standards and Specifications

Materials

- **Bag Material:** Bags must be a geosynthetic material, either polypropylene, polyethylene or polyamide woven fabric, minimum unit weight 4 ounces per yard², mullen burst strength exceeding 300 psi in conformance with the requirements in ASTM designation D3786, and ultraviolet stability exceeding 70% in conformance with the requirements in ASTM designation D4355.
- **Bag Size:** Each gravel-filled bag should have a length of 24 to 32 inches, width of 16 to 20 inches, and thickness of 3 inches. Alternative bag sizes must be submitted to the RE for approval prior to deployment.
- **Gravel:** Fill material should be between 3/8 and 3/4 inch in diameter, and be clean and free from clay balls, organic matter, and other deleterious materials. The opening of gravel-filled bags must be secured such that gravel does not escape. Gravel-filled bags are between 30 and 50 lb in weight. Fill material is subject to approval by the RE.
- Earthen berms must comply with Standard Specifications Section 13-10.03I.

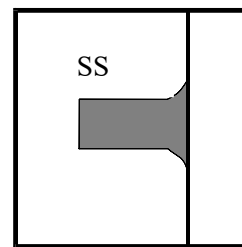

Installation

- When used as a linear control for sediment removal:
 - Install along a level contour.
 - Place gravel-filled bags end-to-end to eliminate gaps in a gravel bag berm.
 - Angle the last 6 feet upslope at the downhill end of the run.

Maintenance and Inspection

- Stack the bags such that the upper row overlaps the joints in the lower row.
- Add layers of gravel-filled bags to increase the height of a temporary gravel bag berm if needed. Stack the bags in the upper row to overlap the joints in the lower row. Stabilize the rows by adding rows of bags in the lower layers.
- Generally, gravel bag barriers can be used in conjunction with temporary soil stabilization controls up slope.
- Construct gravel bag barriers with a set-back from the toe of a slope. Where it is determined to be not practicable due to specific site conditions, the gravel bag barrier may be constructed at the toe of the slope, but be constructed as far from the toe of the slope as practicable.
- Refer to SC-4 “Check Dams” when used for concentrated flows.
- Submit a certificate of compliance for gravel-filled bag material.
- Earthen berms are constructed with either native soil or an alternative selected material.
- Earthen berms must be at least 8 inches in height and 36 inches in width.
- Earthen berms must be compacted by manual or mechanical methods.
- Gravel bag/earthen berms must be inspected in accordance with CGP requirements for the associated project type and risk level or with LTCGP. At a minimum, BMPs must be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Reshape or replace gravel bags as needed, or as directed by the RE.
- Repair washouts or other damages as needed, or as directed by the RE.
- Inspect gravel bag/earthen berms for sediment accumulations and remove sediment when accumulation reaches one-third of the berm height. Removed sediment can be incorporated in the project at locations designated by the RE or disposed of outside the highway right-of-way in conformance with the Standard Specifications.
- Remove gravel bag berms when no longer needed. Remove sediment accumulations and clean, re-grade, and stabilize the area.
- If using earthen berm, ensure soil remains compacted through the duration of the berm
- Maintain earthen berms to provide sediment-holding capacity and to reduce concentrated flow velocities.
- Repair the berm if rills or other evidence of concentrated runoff over it.
- Gravel Bag/Earthen Berm placement must be shown on the WPCDs and reflect site conditions.

- Gravel Bag/Earthen Berm must be discussed in Section 500.3 SWPPP or Section 30.2 of the WPCP.

Tracking Control	<input checked="" type="checkbox"/>
Wind Erosion Control	<input checked="" type="checkbox"/>
Non-Stormwater Management	<input type="checkbox"/>
Materials and Waste Management	<input type="checkbox"/>

Definition and Purpose

Practices to remove tracked sediment to prevent the sediment from entering a storm drain or receiving waters.

Appropriate Applications

These practices are implemented anywhere sediment is tracked from the project site onto public or private paved roads, typically at jobsite entrances and exits.

Limitations

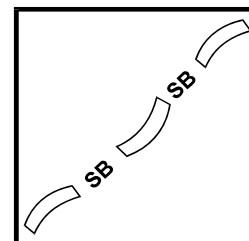

Sweeping and vacuuming may not be effective when soil is wet or muddy.

Standards and Specifications

General Requirements

- Sweep by hand or mechanical methods, such as vacuuming. Kick brooms or sweeper attachments may not be used.
- At least one street sweeper in good working order must be at the job site at all times when street sweeping work is required.
- Use one of the following types of street sweepers:
 - Mechanical sweeper followed by a vacuum-assisted sweeper;
 - Vacuum-assisted, dry, waterless, sweeper; or
 - Regenerative-air sweeper.
- Submit the number and type of street sweepers that will be used on the project for each activity at least 5 business days before starting the activities listed above. Keep and submit street sweeping activity records including sweeping times, locations, and the quantity of material collected.

- Sweep paved roads at construction entrance and exit locations and onsite paved areas:
 - During clearing and grubbing, earthwork, trenching, and pavement-structure construction activities.
 - When vehicles are entering and leaving the job site.
 - After soil-disturbing activities.
 - After observing off-site tracking of material.
 - Sweep within 1 hour if sediment or debris is observed during the activities described above that require sweeping.
 - Sweep within 24 hours if sediment or debris is observed during activities that do not require sweeping.
 - Keep dust to a minimum during street sweeping activities. Use water for dust control or a vacuum whenever dust generation is excessive or sediment pickup is ineffective. Refer to WE-1 for “Wind Erosion Control” BMPs.
 - Remove collected material, including sediment, from paved shoulders, drainage inlets, curbs and dikes, and other drainage areas.
 - After sweeping is finished, collected material may be stockpiled. If not mixed with debris, trash or potentially hazardous objects, consider incorporating the removed sediment back into the project if approved by the RE. Otherwise, dispose of stockpiled material at least once per week according to Standard Specifications Section 14-10.
 - Street sweeping does not void the requirements for residue collection included in other work activities, such as grooving, grinding, or asphalt concrete planing.
- Maintenance and Inspection
- Inspect potential sediment tracking locations daily.
 - Monitor and inspect tracking control BMPs such as TC-1, “Temporary Construction Entrance/Exit,” to reduce sediment accumulation on roads.
 - Be careful not to sweep up any unknown substance or any object that may be potentially hazardous.
 - Adjust brooms frequently; maximize efficiency of sweeping operations.
 - Sweeper material must be disposed in compliance with waste regulations.
- SWPPP or WPCP
- Street Sweeping must be discussed in Section 500.3.4 and 600.2 of the SWPPP or Section 30.2.3 of the WPCP.

Definition and Purpose

A sandbag barrier is a temporary linear sediment barrier consisting of stacked sandbags, designed to intercept and slow the flow of sediment-laden sheet flow runoff. Sandbag barriers allow sediment to settle from runoff before water leaves the construction site.

Appropriate Applications

- Along the perimeter of a site.
- Along streams and channels.
- Below the toe of exposed and erodible slopes.
- Down slope of exposed soil areas.
- Around stockpiles.
- Across channels to serve as a barrier for utility trenches or provide a temporary channel crossing for construction equipment, to reduce stream impacts.
- Parallel to a roadway to keep sediment off paved areas.
- At the top of slopes to divert roadway runoff away from disturbed slopes.
- To divert or direct flow or create a temporary sediment/desilting basin.
- During construction activities in stream beds when the contributing drainage area is less than 5 ac.
- When extended construction, period limits the use of either silt fences or straw bale barriers.
- Along the perimeter of vehicle and equipment fueling and maintenance areas or chemical storage areas.
- To capture and detain non-stormwater flows until proper cleaning operations occur.

- When site conditions or construction sequencing require adjustments or relocation of the barrier to meet changing field conditions and needs during construction.
- To temporarily close or continue broken, damaged or incomplete curbs.
- Limitations ■ Limit the drainage area upstream of the barrier to 5 ac.
- Degraded sandbags may rupture when removed, spilling sand.
- Installation can be labor intensive.
- Limited durability for long-term projects.
- When used to detain concentrated flows, maintenance requirements increase.
- Consider using gravel bags whenever possible since they often do not require as much maintenance or impact wildlife when used near ESAs.

Standards and Specifications

Materials

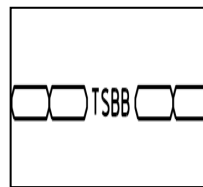

- Sandbag Material: Sandbag can be woven polypropylene, polyethylene or polyamide fabric, minimum unit weight four ounces per square yard, mullen burst strength exceeding 300 psi in conformance with the requirements in ASTM designation D3786, and ultraviolet stability exceeding 70% in conformance with the requirements in ASTM designation D4355. Use of burlap is not acceptable.
- Sandbag Size: Each sand-filled bag should have a length of 18 in, width of 12 in, thickness of 3 in, and mass of approximately 33 lb. Bag dimensions are nominal, and may vary based on locally available materials. Alternative bag sizes must be submitted to the RE for approval prior to deployment.
- Fill Material: All sandbag fill material can be non-cohesive, Class 1 or Class 2 permeable material free from clay and deleterious material, conforming to the provisions in Standard Specifications Section 47-2.02D “Permeable Material”. The requirements for the Durability Index and Sand Equivalent do not apply. Fill material is subject to approval by the RE.

Installation

- When used as a linear sediment control:
 - Install along a level contour.
 - Turn ends of sandbag row up slope to prevent flow around the ends.
 - Generally, sandbag barriers may be used in conjunction with temporary soil stabilization controls up slope to provide effective erosion and sediment control.
- Construct sandbag barriers with a set-back of at least 3 ft from the toe of a slope. Where it is determined to be not practical due to specific site conditions, the sandbag barrier may be constructed at the toe of the slope, but should be constructed as far from the toe of the slope as practicable.

- Maintenance and Inspection
 - Inspect sandbag barriers before and after each rainfall event, and weekly year round.
 - Reshape or replace sandbags as needed, or as directed by the RE.
 - Repair washouts or other damages as needed, or as directed by the RE.
 - Inspect sandbag barriers for sediment accumulations and remove sediments when accumulation reaches one-third the barrier height. Removed sediment can be incorporated in the project at locations designated by the RE or disposed of outside the highway right-of-way in conformance with the Standard Specifications 14-10.
 - Remove sandbags when no longer needed. Remove sediment accumulation, and clean, re-grade, and stabilized the area.
- SWPPP or WPCP
 - Sandbag Barrier must be discussed in Section 500.3 of the SWPPP or Section 30.2 of the WPCP.

Materials and Waste Management	<input type="checkbox"/>

Definition and Purpose A straw bale barrier is a temporary linear sediment barrier consisting of straw bales, designed to intercept and slow sediment-laden sheet flow runoff. Straw bale barriers allow sediment to settle from runoff before water leaves the construction site.

- Appropriate Applications**
- Along the perimeter of a site.
 - Along streams and channels.
 - Below the toe of exposed and erodible slopes.
 - Down slope of exposed soil areas.
 - Around stockpiles.
 - Across minor swales or ditches with small catchments.
 - Around above grade type temporary concrete washouts (see WM-8, “Concrete Waste Management”).
 - Parallel to a roadway to keep sediment off paved areas.

- Limitations**
- Installation can be labor intensive.
 - Straw bale barriers are maintenance intensive.

- Degraded straw bales may fall apart when removed or left in place for extended periods.
- Can't be used on paved surfaces.
- Not to be used for drain inlet protection.
- Not to be used in areas of concentrated flow.
- Can be an attractive food source for some animals.
- May introduce undesirable non-native plants to the area.

Standards and Specifications

Materials

- Straw must conform to the provisions in Standard Specifications Section 21-2.02H, "Straw."
- Each straw bale should be a minimum of 14 in wide, 18 in high, 36 in long and have a minimum weight of 50 lb.
- The straw bale must be composed entirely of vegetative matter, except for the binding material.
- Bales can be bound by either wire, nylon, or polypropylene string placed horizontally. Jute and cotton binding may not be used. Baling wire should be at least 16 gauge. Nylon or polypropylene string should have a diameter of approximately 0.08 in with a breaking strength of 80 lbs.
- Wood or metal posts should be used as stakes. Posts for straw bale barriers must comply with Standard Specifications Section 16-2.03 "High-Visibility Fences."

Installation

- Place a single row of straw bales end-to-end and parallel with the slope contour. For any 20-foot section of straw bale barrier, do not allow it to vary by more than 5% from level.
- Place straw bales in a trench or key them into the slope. Place the bales such that the binding wire or string does not come in contact with the soil. Use wood or metal posts as stakes.

- Secure each straw bale with two posts. The first post in each bale must be driven toward the previously laid bale to force the bales together. Drive the posts into the soil such that the top of the post is less than 2 in. above the top of the straw bale. The post must extend a minimum of 2 ft in the ground below the bottom of the straw bales.
- Angle the last 6 feet upslope at the downhill end of the run.
- See page 5 of this BMP for installation detail.

Other Considerations

- Construct straw bale barriers with a set-back of at least 3 ft from the toe of a slope. Where it is determined to be not practical due to specific site conditions, the straw bale barrier may be constructed at the toe of the slope, but be constructed as far from the toe of the slope as practical.
- This BMP may be implemented on a project-by-project basis in addition to other BMPs when determined necessary and feasible by the RE.
- Straw bale barriers may be used in combination with a silt fence (see SC-2 “Silt Fence”) for additional sediment control.

Maintenance and Inspection

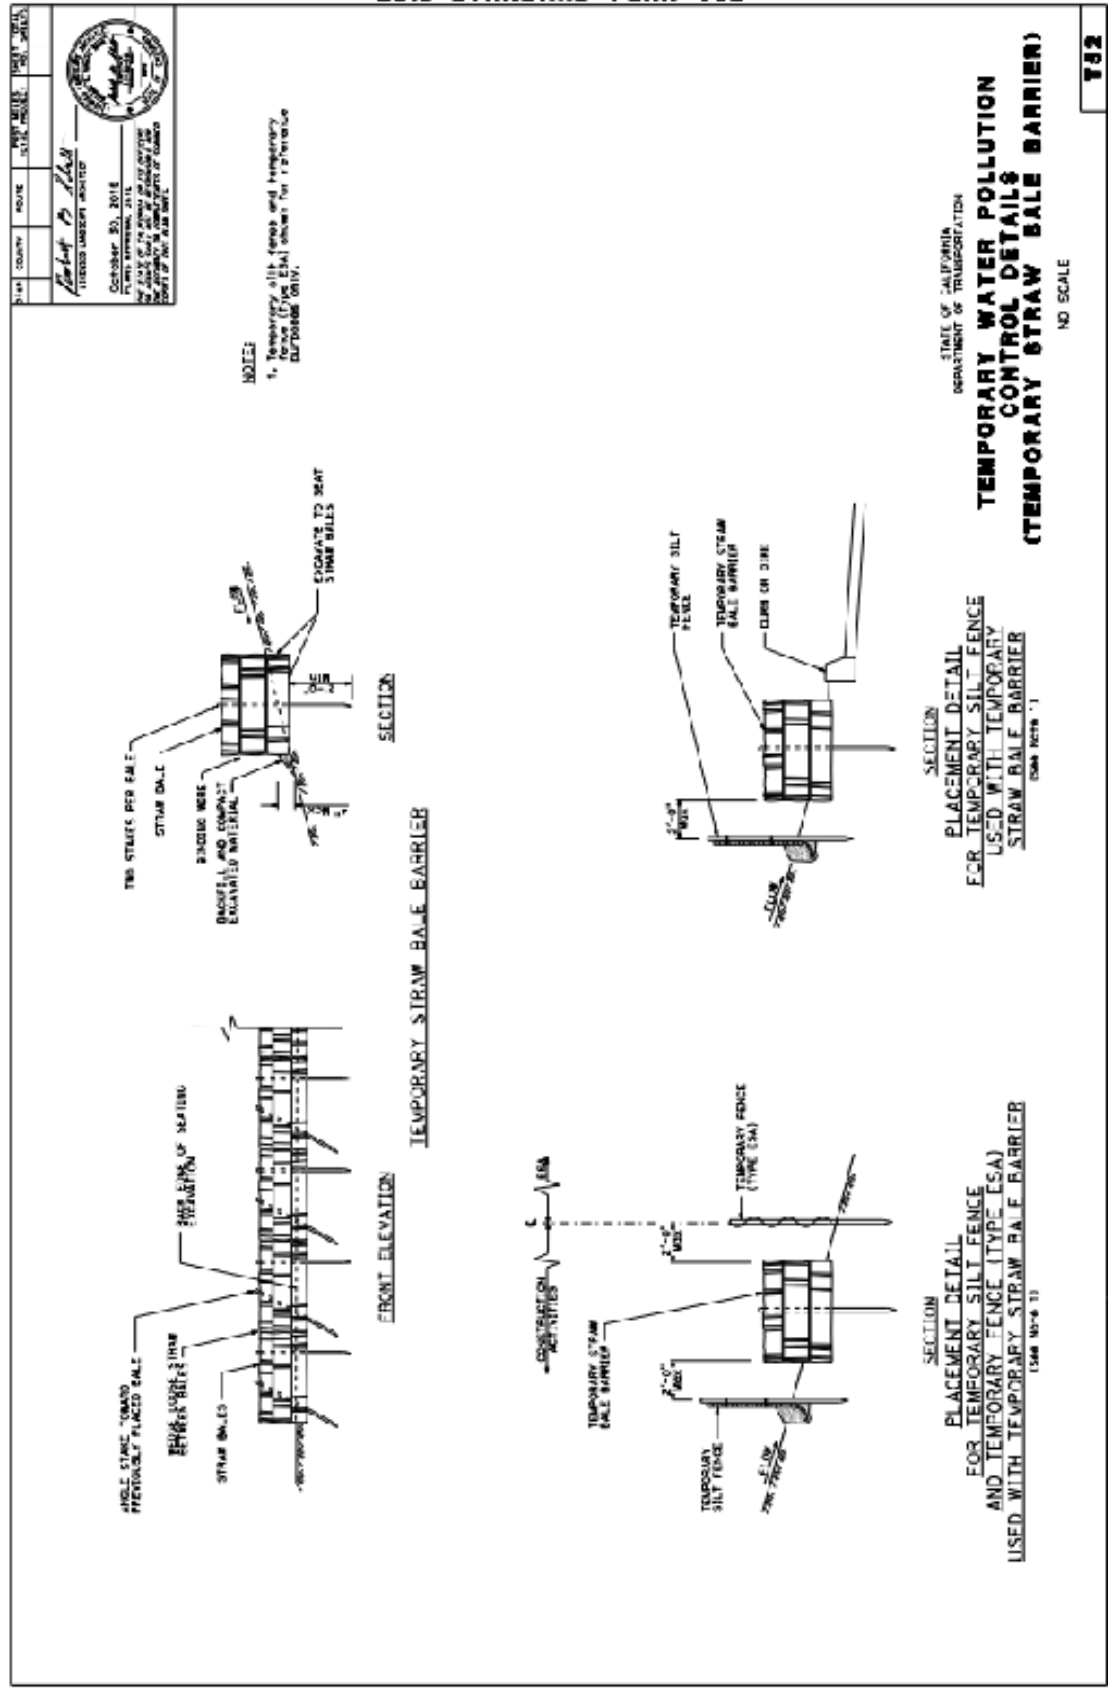

- At a minimum, BMPs must be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect straw bale barriers for sediment accumulations and remove sediment when depth reaches one-third the barrier height. Removed sediment should be disposed of outside the highway right-of-way in conformance with the Standard Specifications.
- Replace or repair damaged bales as needed or as directed by the RE.
- Repair washouts or other damages as needed or as directed by the RE.
- Remove straw bales when no longer needed. Remove sediment accumulation, and clean, re-grade, and stabilized the area.
- Straw Bale Barrier placement must be shown on the WPCDs and reflect current site conditions.

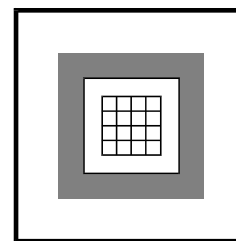

SWPPP or WPCP

- Straw Bale Barrier must be discussed in Section 500.3 of the SWPPP or Section 30.2 of the WPCP.

Tracking Control	<input type="checkbox"/>
Wind Erosion Control	<input type="checkbox"/>
Non-Stormwater Management	<input type="checkbox"/>
Materials and Waste Management	<input type="checkbox"/>

- Definition and Purpose** Temporary drainage inlet protection consists of devices used at storm drain inlets that detain and/or filter sediment-laden runoff prior to discharge into storm drainage systems. This is achieved by allowing sediment to settle and/or filtering sediment upstream of a linear sediment barrier.
- Appropriate Applications**
- Where ponding will not encroach into highway traffic.
 - Where sediment laden surface runoff may enter an inlet.
 - Where disturbed drainage areas have not yet been permanently stabilized.
 - Where the drainage area is 1 ac or less.
 - Used year-round.
- Limitations**
- Requires an adequate area for water to pond without encroaching upon traveled way and should not present an obstacle to oncoming traffic.
 - May require other methods of temporary protection to prevent sediment-laden stormwater and non-stormwater discharges from entering the storm drain system.
 - Sediment removal may be difficult in high flow conditions or if runoff is heavily sediment laden. If high flow conditions are expected, use other on-site sediment trapping techniques, such as SC-4 “Check Dams,” in conjunction with temporary drainage inlet protection.
 - Frequent maintenance is required.
 - Silt fence inlet protection is appropriate in open areas that are subject to sheet flow and for flows not exceeding 0.5 cfs.

- Gravel bag barriers for inlet protection are applicable when sheet flows or concentrated flows exceed 0.5 cfs, and it is necessary to allow for overtopping to prevent flooding.
- Fiber rolls and foam barriers are not appropriate for locations where they cannot be properly anchored to the surface.
- Excavated drop inlet sediment traps are appropriate where relatively heavy flows are expected and overflow capability is needed.
- For drainage areas larger than 1 ac, runoff should be routed to a sediment trapping device designed for larger flows. See BMPs SC-2, “Sediment/Desilting Basin,” and SC-3 “Sediment Trap/Curb Cutback.”

Standards and Specifications

General Requirements

- Refer to Standard Specifications Section 13-6.03C for “Temporary Drainage Inlet Protection” and 13-6.03F for “Rigid Plastic Barriers.”
- Identify existing and/or planned storm drain inlets that have the potential to receive sediment-laden surface runoff. Determine if storm drain inlet protection is needed, and which method or combination of methods to use. Update inlet protection as site conditions change.
- Use a linear sediment barrier to redirect runoff and control ponding in order to prevent ponding from encroaching on the traveled way or overtopping the curb or dike.
- Prior to installation, clear the area around each inlet of obstructions, including rocks, clods, and debris greater than 1-in. in diameter.
- Install linear sediment barriers upstream of the inlet and parallel with the curb, dike, or flow line to keep sediment from entering the inlet.
- Remove accumulated sediment according to Maintenance and Inspection recommendations. Accumulated sediment may be disposed of outside the highway right-of-way in conformance with the Standard Specifications Section 14-10.

Type 1 - Silt Fence

- This method should be used for drain inlets requiring protection in areas where finished grade is established and erosion control seeding has been applied or is pending. The silt fence (Type 1) protection is illustrated on Page 6. Do not place filter fabric underneath the inlet grate since the collected sediment may fall into the drain inlet when the fabric is removed or replaced.
- Type 2 - Excavated Drop Inlet Sediment Trap
- This method may be used for drainage inlets requiring protection in areas that have been cleared and grubbed, and where exposed soil areas are subject to grading. The excavated drop inlet sediment trap (Type 2) is illustrated on Page 7. Similar to constructing a temporary silt fence; see BMP SC-1, “Silt Fence.” Size the excavated trap to provide a minimum storage capacity calculated at the rate of 67 yd³/ac of drainage area.

Type 3A – Gravel Bag Berm for Combined Inlets

- This method may be used for drain inlets surrounded by AC or paved surfaces. The gravel bag berm for combined inlets (Type 3A) is illustrated on Pages 8-9. Flow from a severe storm must not overtop the curb. In areas of high clay and silts, use filter fabric and gravel as additional filter media. Construct gravel bags in accordance with BMP SC-6, “Gravel Bag Berm.” Gravel bags are used due to their high permeability.

Type 3B – Gravel Bag Berm for Grate Inlets

- This method may be used for drainage inlets surrounded by AC or paved surfaces. The gravel bag berm for grate inlets (Type 3B) is illustrated on Page 10. In areas of high clay and silts, use filter fabric and gravel as additional filter media. Place gravel bags in accordance with BMP SC-6, “Gravel Bag Berm.” Gravel bags are used due to their high permeability.

Type 4A – Flexible Sediment Barrier for Grate Inlets

- This method may be used for drainage inlets requiring protection in areas that have been cleared and grubbed, and where exposed soil areas subject to grading. Flexible Sediment Barrier for Grate Inlets (Type 4A) is placed around the inlet and keyed and anchored to the surface. Flexible Sediment Barriers are intended for use as inlet protection where the area around the inlet is unpaved and the foam barrier or fiber roll can be secured to the surface. Place fiber rolls over the erosion control blanket. RE or appropriate licensed professional approval is required.

Type 4B – Flexible Sediment Barrier for Combined Inlets

- This method may be used for drainage inlets requiring protection in areas that have been cleared and grubbed, and where exposed soil areas subject to grading. Flexible Sediment Barrier for Combined Inlets (Type 4B) is placed in rows upstream of the inlet and along the curb or dike. The barriers are keyed and anchored to the surface. Flexible Sediment Barriers are intended for use as inlet protection where the area around the inlet is unpaved and the foam barrier or fiber roll can be secured to the surface. Place the barrier to provide a tight joint with the curb or dike. Cut the cover fabric or jacket to ensure a tight fit. RE and Construction Storm Coordinator approval is required.

Type 5 – Sediment Filter Bag

- This method may be used in areas with vehicle and equipment traffic that could damage aboveground inlet protection devices. The Sediment Filter Bags are installed as follows: (1) Remove the drainage inlet grate, (2) Place the sediment filter bag in the opening, and (3) Replace the grate to secure the sediment filter bag in place.

Type 6A – Catch Basin with Grate

- Catch Basin with Grate (Type 6A) is shown on page 16. Cover grate inlet with rigid plastic barrier and secure on each end with gravel-filled bags. If using a rigid sediment barrier and the grated inlet does not have a curb opening, place the barrier using a gasket to prevent runoff from flowing under the barrier. Secure the barrier to the pavement with nails and adhesive, gravel-filled bags, or a combination of both.

Type 6B – Curb Inlet without Grate

- Curb Inlet without Grate (Type 6B) is shown on page 16. Place the flexible sediment barrier across the curb inlet opening and secure with gravel-filled bags.

Maintenance and Inspection

General Requirements

- Inspect all drainage inlet protection devices before and after every rainfall event and weekly year round. During extended rainfall events, inspect inlet protection devices at least once every 24 hours.
- Inspect the storm drain inlet after severe storms to check for bypassed material.
- Remove all drainage inlet protection devices within thirty days after the site is stabilized, or when the inlet protection is no longer needed.
 - Bring the disturbed area to final grade and smooth and compact it. Appropriately stabilize all bare areas around the inlet.
 - Clean and re-grade area around the inlet and clean the inside of the storm drain inlet as it must be free of sediment and debris at the time of final inspection.

Type 1 - Filter Fabric Fence

- Make sure the stakes are securely driven in the ground and are structurally sound (i.e., not bent, cracked, or splintered, and are reasonably perpendicular to the ground). Replace damaged stakes.
- Replace or clean the fabric when the fabric becomes clogged with sediment. Make sure the fabric does not have any holes or tears. Repair or replace fabric as needed or as directed by the RE.
- At a minimum, remove the sediment behind the fabric fence when accumulation reaches one-third the height of the fence or barrier height.

Type 2 – Excavated Drop Inlet Sediment Trap

- Remove sediment from basin when the volume of the basin has been reduced by one-half.

Type 3A - Gravel Bag Berm for Combined Inlets

- Inspect bags for holes, gashes, and snags.
- Check gravel bags for proper arrangement and displacement. Remove the sediment behind the barrier when it reaches one-third the height of the barrier.

Type 3B - Gravel Bag Berm for Grate Inlets

- Inspect bags for holes, gashes, and snags.
- Check gravel bags for proper arrangement and displacement. Remove the sediment behind the barrier when it reaches one-third the height of the barrier.

Type 4A Flexible Sediment Barrier for Grate Inlets

- Check flexible sediment barrier for proper arrangement and displacement. Remove the sediment behind the barrier when it reaches one-third the height of the barrier.

Type 4B Flexible Sediment Barrier for Combined Inlets

- Check flexible sediment barrier for proper arrangement and displacement. Remove the sediment behind the barrier when it reaches one-third the height of the barrier.

Type 5 Sediment Filter Bag

- Change sediment filter bag carefully ensuring not to spill captured sediment into the drainage inlet.

Type 6A Catch Basin with Grate

- Check barrier and gravel-filled bags for proper arrangement and displacement. Routinely remove accumulated sediment

Type 6B Curb Inlet without Grate

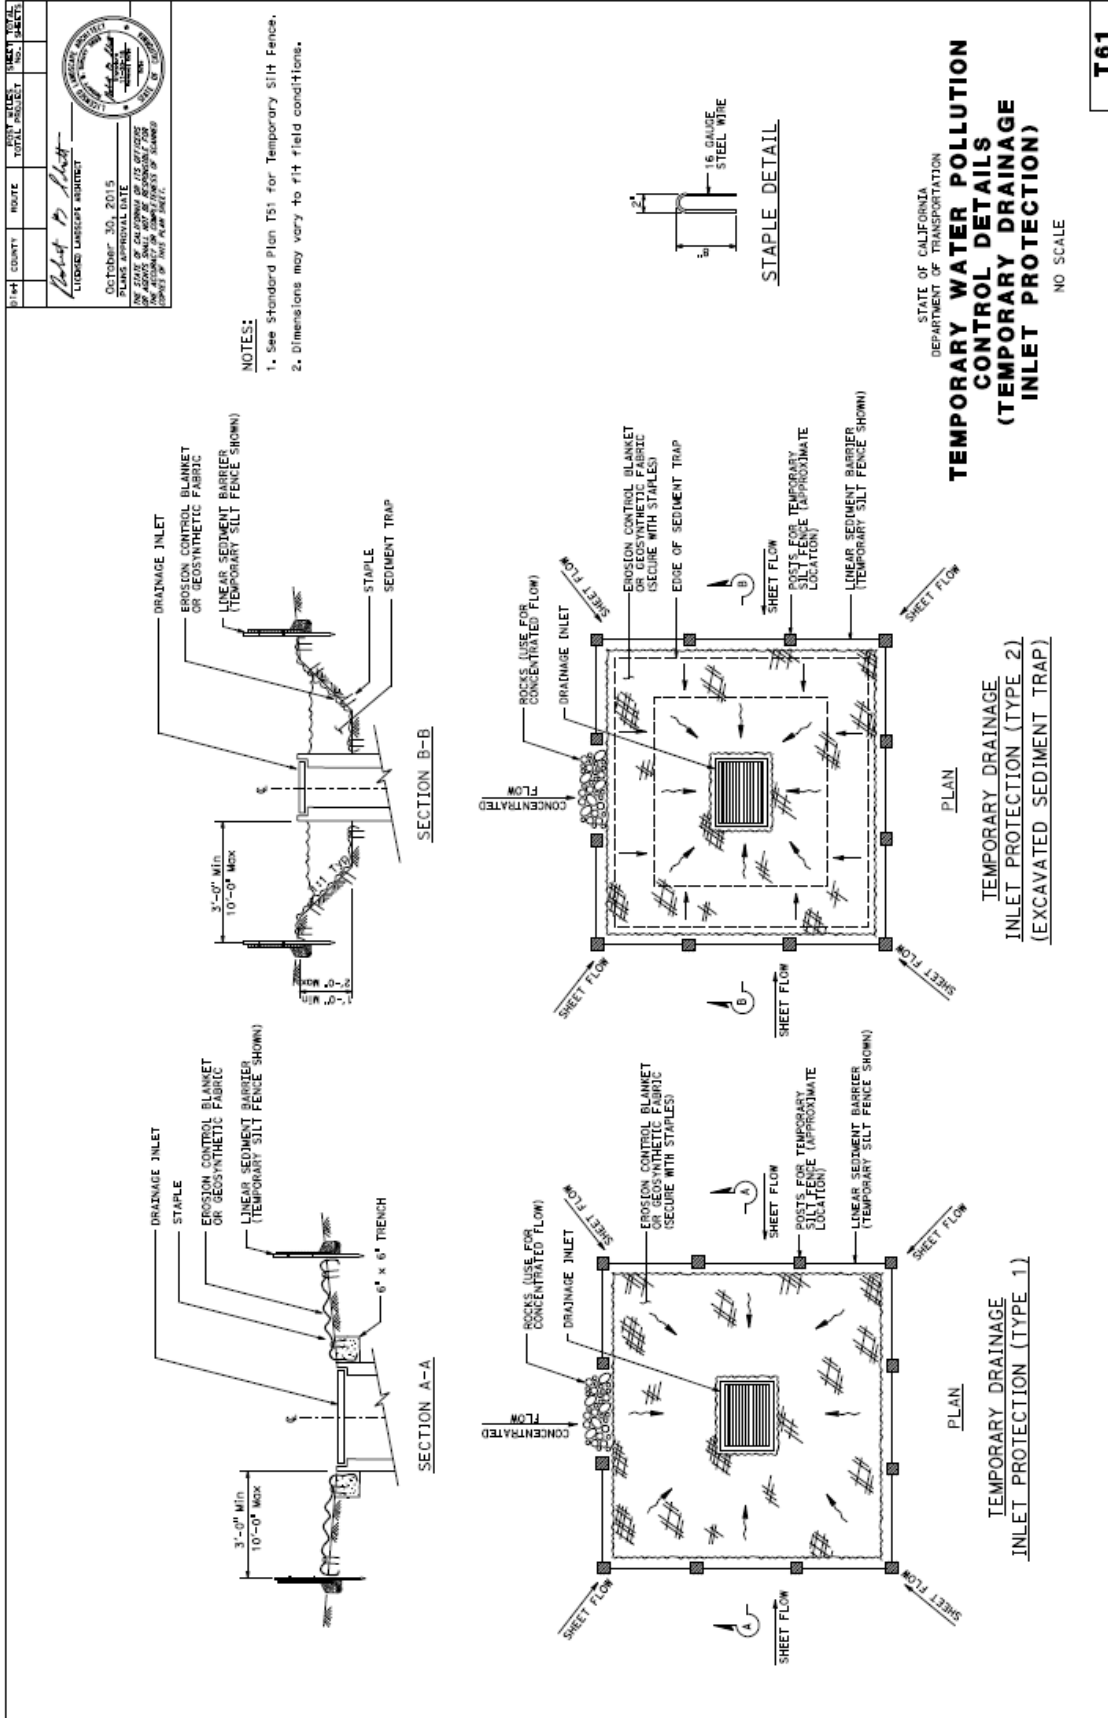

- Check barrier and gravel-filled bags for proper arrangement and displacement.
- Remove the sediment behind the barrier when it reaches one-third the height of the barrier.

- SWPPP or WPCP
- Temporary Drainage Inlet Protection must be discussed in Section 500.3.2 of SWPPP and/or Section 30.2.2 of the WPCP. Temporary Drainage Inlet Protection placement type must be shown on the WPCDs and reflect site temporary conditions.

|------------------------------|---|
| Definition and Purpose | <ul style="list-style-type: none"> ■ Compost socks are a mesh sock containing compost that act as three dimensional, biodegradable structures that intercept and filter sheet flow. Compost socks can filter runoff, retain sediment, and reduce sheet flow velocities. Compost socks may be used as either a temporary or permanent sediment control measure. |
| Appropriate Applications | <ul style="list-style-type: none"> ■ Compost socks may be applied as both temporary and permanent sediment controls. ■ Along the toe, top, face, and at grade breaks of exposed and erodible slopes to shorten slope length and spread runoff as sheet flow. ■ Along the perimeter of a project. ■ As check dams in unlined ditches. ■ Down-slope of exposed soil areas. ■ At operational storm drains as a form of inlet protection. ■ Around temporary stockpiles. |
| Limitations | <ul style="list-style-type: none"> ■ Compost can potentially leach nutrients into runoff and negatively affect water quality. Compost should not be used directly upstream from a nutrient-impaired water body. ■ Compost socks are susceptible to damage by traffic. Compost socks may be used around heavy machinery, but frequent disturbance decreases sock performance. |
| Standards and Specifications | <p>General Requirements</p> <ul style="list-style-type: none"> ■ Compost socks must comply with Standard Specifications 21-2.02Q and 21-2.03Q. |

- Compost for compost socks must comply with Standard Specifications Section 21-2.02K, except the particle size must be for coarse compost.
- Compost sock installation is illustrated in Standard Plan H51.
- Compost socks consist of a 12-inch diameter mesh tube that is filled with compost. The mesh tube must be composed of a natural biodegradable product such as cotton, jute, sisal, burlap, or coir. The mesh tube must be clean, evenly woven, and free of encrusted concrete or other contaminating materials, cuts, tears, broken or missing yarns, and thin, open, or weak places.
- Compost socks must have a functional longevity of one year.

Installation

- Before installing compost sock, remove obstructions from the ground including rocks, clods, and debris greater than 1 inch in diameter.
- For any 20-foot section of compost sock, prevent the compost sock from varying more than 5 percent from level.
- Use the following spacing unless otherwise noted on the project plans or special provisions:
 - 10 feet apart for slopes steeper than 2:1 (H:V)
 - 15 feet apart for slopes from 2:1 to 4:1 (H:V)
 - 20 feet apart for slopes from 4:1 to 10:1 (H:V)
 - 50 feet apart for slopes flatter than 10:1 (H:V)
- Place mesh tube, secure the end, and fill uniformly with compost. Secure the remaining end.
- For Type 1 installations:
 - Place in a furrow that is from 2 to 4 inches deep.
 - Fasten with wood stakes every 4 feet along the length of the compost sock.
 - Fasten the ends of the compost sock by placing a stake 6 inches from the end of the sock.
 - Drive the stakes into the soil so the top of the stake is less than 2 inches above the top of the compost sock.
- For Type 2 installations:
 - Fasten with notched wood stakes and rope.
 - Drive stakes into the soil until the notch is even with the top of the compost sock.
 - Lace the rope between stakes and over the compost sock. Knot the rope at each stake.

- Tighten the fiber roll to the surface of the slope by driving the stakes further into the soil.

- If more than one compost sock is placed in a row, the socks should be overlapped; not abutted. Stagger overlapping joints in adjacent rows by 5 to 10 feet.

Removal

- For permanent installations: do not remove compost socks. Compost socks will degrade over time.
- For temporary installations: remove sock, rope and stakes if ordered by the RE. Cut sock and empty contents in place.

Other Considerations

- Compost may be pre-seeded before placement into the mesh tube to assist in establishing vegetation. Once established, vegetation root systems provide additional soil stability and runoff filtration.
- Permanent compost sock applications are particularly advantageous below embankments, especially adjacent streams, by limiting re-entry and the disturbance to sensitive areas.
- Organic material in compost is important for pollutant removal and vegetation establishment. Organic content of the compost should range from 30 to 65% depending on site conditions.

Maintenance and Inspection

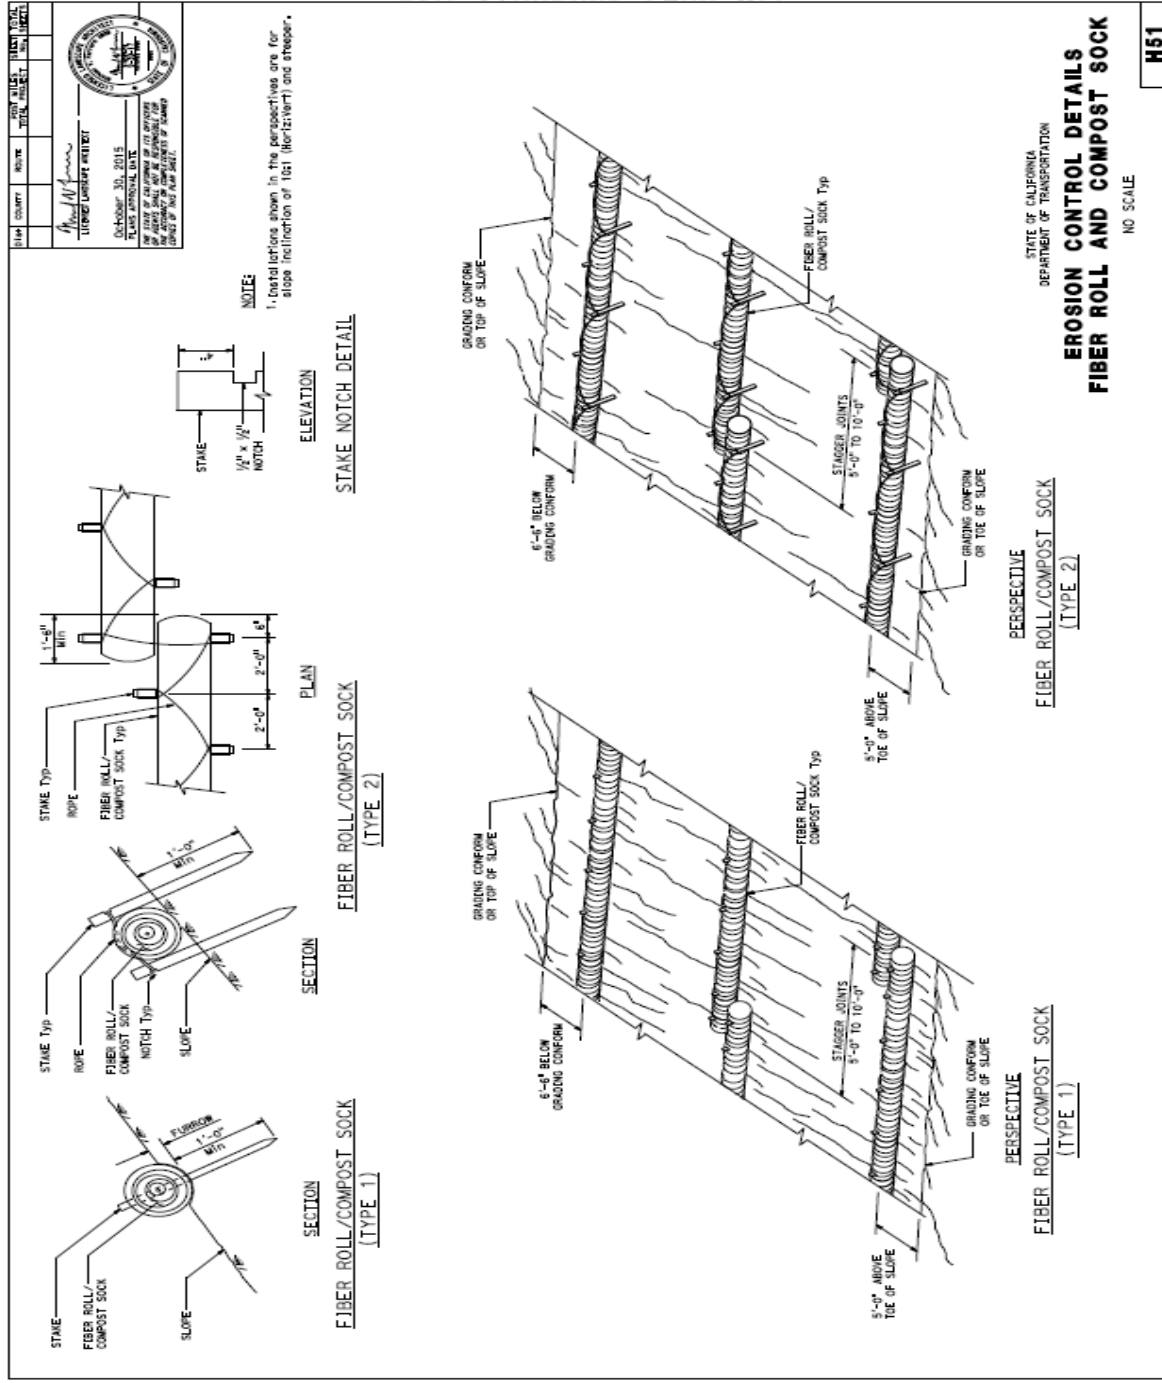

- Inspect compost socks before and after each rainfall event, and weekly year round.
- Remove sediment from behind the compost sock if sediment is 1/3 of compost sock height above ground.
- Repair or adjust the compost sock if rills or other evidence of concentrated runoff occur beneath the sock.
- Repair or replace compost socks if they become split, torn, or unraveled.
- Add stakes if the compost sock slumps or sags.
- Replace broken or split wood stakes.
- Maintain compost socks to provide an adequate sediment holding capacity and runoff velocity reduction.

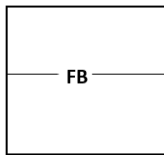

SWPPP or WPCP

- Compost Socks must be discussed in Section 500.3 of the SWPPP or Section 30.2 of the WPCP.

Compost Socks

Non-Stormwater Management	<input type="checkbox"/>
Materials and Waste Management	<input type="checkbox"/>

- Definition and Purpose**

 - Flexible sediment barriers are synthetic alternatives to fiber rolls, compost socks, and straw bale barriers. Flexible sediment barriers consist of a geosynthetic fabric with a urethane foam-filled core and a fabric apron that helps to prevent undermining and scour. These synthetic linear sediment barriers are generally more robust sediment controls than standard fiber rolls, and may be appropriate for continuous use in stormwater collection areas.

- Appropriate Applications**

 - Along the perimeter of a project.
 - As check dams in ditches, channels, or other stormwater collection areas.
 - Down-slope of exposed soil areas.
 - At operational storm drains as a form of inlet protection.
 - Around temporary stockpiles.
 - On either paved surfaces or soil.
 - As a linear sediment control for SC-10 “Temporary Drain Inlet Protection.”

- Limitations**

 - Frequent maintenance is required if sediment-laden discharges are upstream of the BMP to maintain it operational.

- Standards and Specifications**

General Requirements

 - Flexible sediment barriers must comply with Standard Specifications Sections 13-10.02I and 13-10.03H.
 - Flexible sediment barriers consist of:
 - A urethane foam-filled core.
 - Geosynthetic fabric cover and flap.
 - Triangular, circular, or square cross section.
 - Vertical height of at least 5 inches after installation.

- Horizontal flap at least 8 inches in width.
- Length of at least 4 feet per unit.
- Ability to interlock separate units into a long barrier such that water will not flow between units.
- Geosynthetic fabric for flexible sediment barriers covers must have:
 - Minimum grab break load of 200 lbs., per ASTM D4632.
 - Minimum apparent elongation of 15%, per ASTM D4632.
 - Average water flow rate of 100-150 gallons per minute per square foot, per ASTM D4491.
 - Minimum permittivity of 0.05 1/sec, per ASTM D4491.
 - Maximum apparent opening size of the 40 U.S. standard sieve size, per ASTM D4751.
 - Minimum ultraviolet radiation resistance of 70% retained grab breaking load at 500 hours of exposure, per ASTM D4355.
- Submit a certificate of compliance for flexible sediment barriers.

Installation

- Remove obstructions, including rocks, clods, and debris greater than 1 inch in diameter, from the ground.
- Secure flexible sediment barriers to pavement with:
 - 1-inch concrete nails, 1-inch washers, and solvent-free adhesive,
 - Gravel-filled bags, or
 - A combination of both of the above methods.
- Secure flexible sediment barriers to soil with 6-inch nails and 1-inch washers.
- Secure connection points of two adjacent sections of flexible sediment barriers with 2 nails.
- Do not pierce the foam core of the barrier with nails.
- Inspect flexible sediment barriers before and after each rainfall event, and weekly year round.
- Maintain a flexible sediment barriers to provide sediment-holding capacity and to reduce concentrated flow velocities.
- Repair or adjust the flexible sediment barriers if rills or other evidence of concentrated runoff occur beneath it.
- Repair or replace split, torn, or unraveled material. Add or replace posts, stakes, or fasteners as needed to prevent sagging or slumping.

Maintenance and Inspection

- Reattach any flexible sediment barriers that detaches from the pavement.
 - Remove sediment deposits if the sediment exceeds 1/3 of the height above the ground behind a foam barrier.
- SWPPP or WPCP
- Remove Flexible sediment barriers must be discussed in Section 500.3 of the SWPPP or Section 30.2 of the WPCP.

Wind Erosion Control BMP

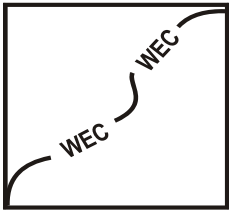

5.1 Wind Erosion Control

Wind erosion control consists of applying water or other dust palliatives as necessary to prevent or alleviate dust nuisance. Wind erosion control BMPs are shown in Table 5-1.

ID	BMP Name
WE-1	Wind Erosion Control

Other BMPs that are sometimes applied to disturbed soil areas to control wind erosion are BMPs SS-3 through SS-7, shown in Section 3 of this Manual; BMP TC-2, shown in Section 6; and BMP NS-7, shown in the Section 7. The remainder of this Section describe the working details for the Wind Erosion Control BMP.

This page intentionally left blank.

Standard Symbol

BMP Objectives	
Soil Stabilization	<input checked="" type="checkbox"/>
Sediment Control	<input checked="" type="checkbox"/>
Tracking Control	<input type="checkbox"/>
Wind Erosion Control	<input checked="" type="checkbox"/>
Non-Stormwater Management	<input type="checkbox"/>
Materials and Waste Management	<input type="checkbox"/>

- Definition and Purpose**
- Wind erosion control consists of applying water or other dust palliatives as necessary to prevent or alleviate erosion by the forces of wind. Dust control must be applied in accordance with Caltrans standard practices. Covering of small stockpiles or areas is an alternative to applying water or other dust palliatives; see SS-7 for “Temporary Cover and Rolled Erosion Control Products”
 - Must comply with local agencies such as Air Quality Management District’s requiring dust control plans or dust control permits as well as any Air Clean Act requirements.
- Appropriate Applications** This practice is generally implemented on all exposed soils subject to wind erosion.
- Limitations**
- Effectiveness depends on soil, temperature, humidity and wind velocity.
 - Chemically treated subgrades could cause soil to become water repellant, preventing infiltration or the long-term re-vegetation of the site.
- Standards and Specifications** Standard Specification Section 10-5 contains general requirements for “Dust Control.”
- Effective dust control is accomplished by applying dust palliatives, temporary Soil Stabilization BMPs, Tracking Controls and managing stockpiles.
 - “Dust Palliatives” are covered under Section 18 of the Standard Specifications. Acceptable dust palliatives include water, dust control binders, and dust suppressants. Dust control binders must comply with specifications for tackifier. Dust suppressants include petroleum-based organic product, nonpetroleum-based organic product, hygroscopic product, and synthetic polymer emulsion.

- If a dust suppressant or tackifier is used, submit a Dust Treatment Plan. Submit a certificate of compliance for dust suppressants, tackifiers, and fibers.
 - Identify and stabilize key access points with the use of Tracking Control BMPs.
 - Minimize the impact of dust by anticipating the direction of prevailing winds.
 - Temporary soil stabilization BMPs, such as SS-3 “Hydraulic Mulch”, SS-4 “Hydroseed, SS-5 “Soil Binders, also provide wind erosion control benefits.
 - Ensure proper implementation of BMPs WM-3, “Stockpile Management,” and SC-7, “Street Sweeping,” as these BMPs provide wind erosion control benefits.
 - Ensure that water is applied by means of pressure-type distributors or pipelines equipped with a spray system or hoses and nozzles to ensure even distribution.
 - All distribution equipment should be equipped with a positive means of shutoff.
 - Chemical dust suppression products could have environmental water quality impacts. Depending on the product and the time of application, water quality sampling for non-visible pollutants should be assessed when a storm even is forecasted.
 - For chemical or petroleum based organics stabilization, there are many products available. These products should not create any adverse effects on stormwater, plant life, groundwater and should meet all applicable regulatory requirements including inspection, documentation, monitoring and reporting requirements.
 - Unless water is applied by means of pipelines, at least one mobile unit should be available at all times to apply water or dust palliative to the project.
 - If reclaimed water is used, the sources and discharge must meet California Department of Health Services water reclamation criteria and the RWQCB requirements. Non-potable water must not be conveyed in tanks or drain pipes that will be used to convey potable water and there must be no connection between potable and non-potable supplies. Non-potable tanks, pipes and other conveyances must be marked “NON-POTABLE WATER - DO NOT DRINK.”
 - Appendix B of this Manual includes additional information on selecting temporary soil stabilization products that could be used for Wind Erosion Control.
- Maintenance and Inspection**
- Check areas where wind erosion controls have been implemented daily for erosion and visible dust.
 - Most water-based dust control measures require frequent application. Obtain vendor or independent information on longevity of chemical dust suppression.

- SWPPP or WPCP ■ Wind Erosion Control must be discussed in Section 500.3.5 of the SWPPP or Section 30.2.4 of the WPCP.

Section 6

Tracking Control BMP

6.1 Tracking Control

Tracking control consists of preventing or reducing vehicle tracking from entering a storm drain or watercourse. Tracking control BMPs are shown in Table 6-1.

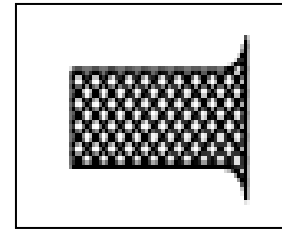

Table 6-1. Tracking Control BMPs	
ID	BMP Name
TC-1	Temporary Construction Entrance/Exit
TC-2	Temporary Construction Roadway
TC-3	Entrance/Outlet Tire Wash

The remainder of this section describe the working details for the tracking control BMPs.

Temporary Construction Entrance/ Exit

TC-1

Standard Symbol

BMP Objectives	
Soil Stabilization	<input checked="" type="checkbox"/>
Sediment Control	<input type="checkbox"/>
Tracking Control	<input checked="" type="checkbox"/>
Wind Erosion Control	<input checked="" type="checkbox"/>
Non-Stormwater Management	<input type="checkbox"/>
Materials and Waste Management	<input type="checkbox"/>

- Definition and Purpose** A temporary construction entrance/exit is defined by a point of entrance/exit to a construction site that is stabilized to reduce the tracking of mud and dirt onto public roads by construction vehicles.
- Appropriate Applications**
- Where dirt or mud can be tracked onto public roads.
 - Adjacent to water bodies.
 - Where poor soils are encountered.
 - Where dust is a problem during dry weather conditions.
- Limitations**
- Site conditions will dictate design and need.
 - Limit the points of entrance/exit to the construction site.
 - Limit speed of vehicles to control dust.
- Standards and Specifications**
- General Requirements**
- Temporary construction entrance/exit must comply with Standard Specification Section 13-7.03 Temporary Construction Roadways and Entrances.
 - Corrugated steel panels must be pressed or shop welded. They should have a slot or hook for coupling the panels together.
 - Class 8 RSP fabric shall be used to line temporary construction entrance/exit. Do not drive on the fabric until the rock is spread. Repair damaged fabric by placing new fabric over the damaged area with at least an 18-inch overlap on all edges.

Temporary Construction Entrance/ Exit

TC-1

- Type A rock should be used for a Type 1 temporary construction entrance/exit. Type A rock must comply with Section 13-7.03B (2) of the Standard Specifications.
- Type B rock should be used for a Type 2 temporary construction entrance/exit. Type B rock must comply with Section 13-7.03B (2) of the Standard Specifications.
- Submit details for alternative construction entrances at least 5 business days before installation. This may include alternatives for the sump and corrugated steel panels or to eliminate the sump.

Installation

- Prepare the location for the temporary construction entrance/exit as follows:
 - Remove vegetation and clear debris.
 - Grade the ground to a uniform plane.
 - Remove sharp objects that could damage the fabric.
 - Compact the top 1.5 feet of soil to at least 90 percent relative compaction.
- Construct the temporary construction entrance/exit as follows (standard plans attached below):
 - Place the fabric along the length of the construction entrance/exit.
 - Overlap fabric ends by at least 12 inches.
 - Cover the fabric with rock within 24 hours.
 - Spread rock over the fabric in the direction of traffic.
 - Keep a 6-inch layer of rock over the fabric to prevent damage from the spreading equipment.
- For a Type 2 temporary construction entrance/exit, place rock under the corrugated steel panels. Use at least 6 corrugated steel panels for each entrance. Couple the panels together to prevent movement.
- If a sump is used, install it within 20 ft of the temporary construction entrance/exit.

Other Considerations

- Implement BMP SC-7, “Street Sweeping” as required under Section 13-4.03F and 13-7 of the Standard Specifications.
- Require all employees, subcontractors, and suppliers to utilize the temporary construction entrance/exit. If the construction entrance/exit has metal plates as part of the BMP, all vehicles must be required to utilize them.
- Route runoff from temporary construction entrances/exits through a sediment-trapping device before discharge.

Temporary Construction Entrance/ Exit

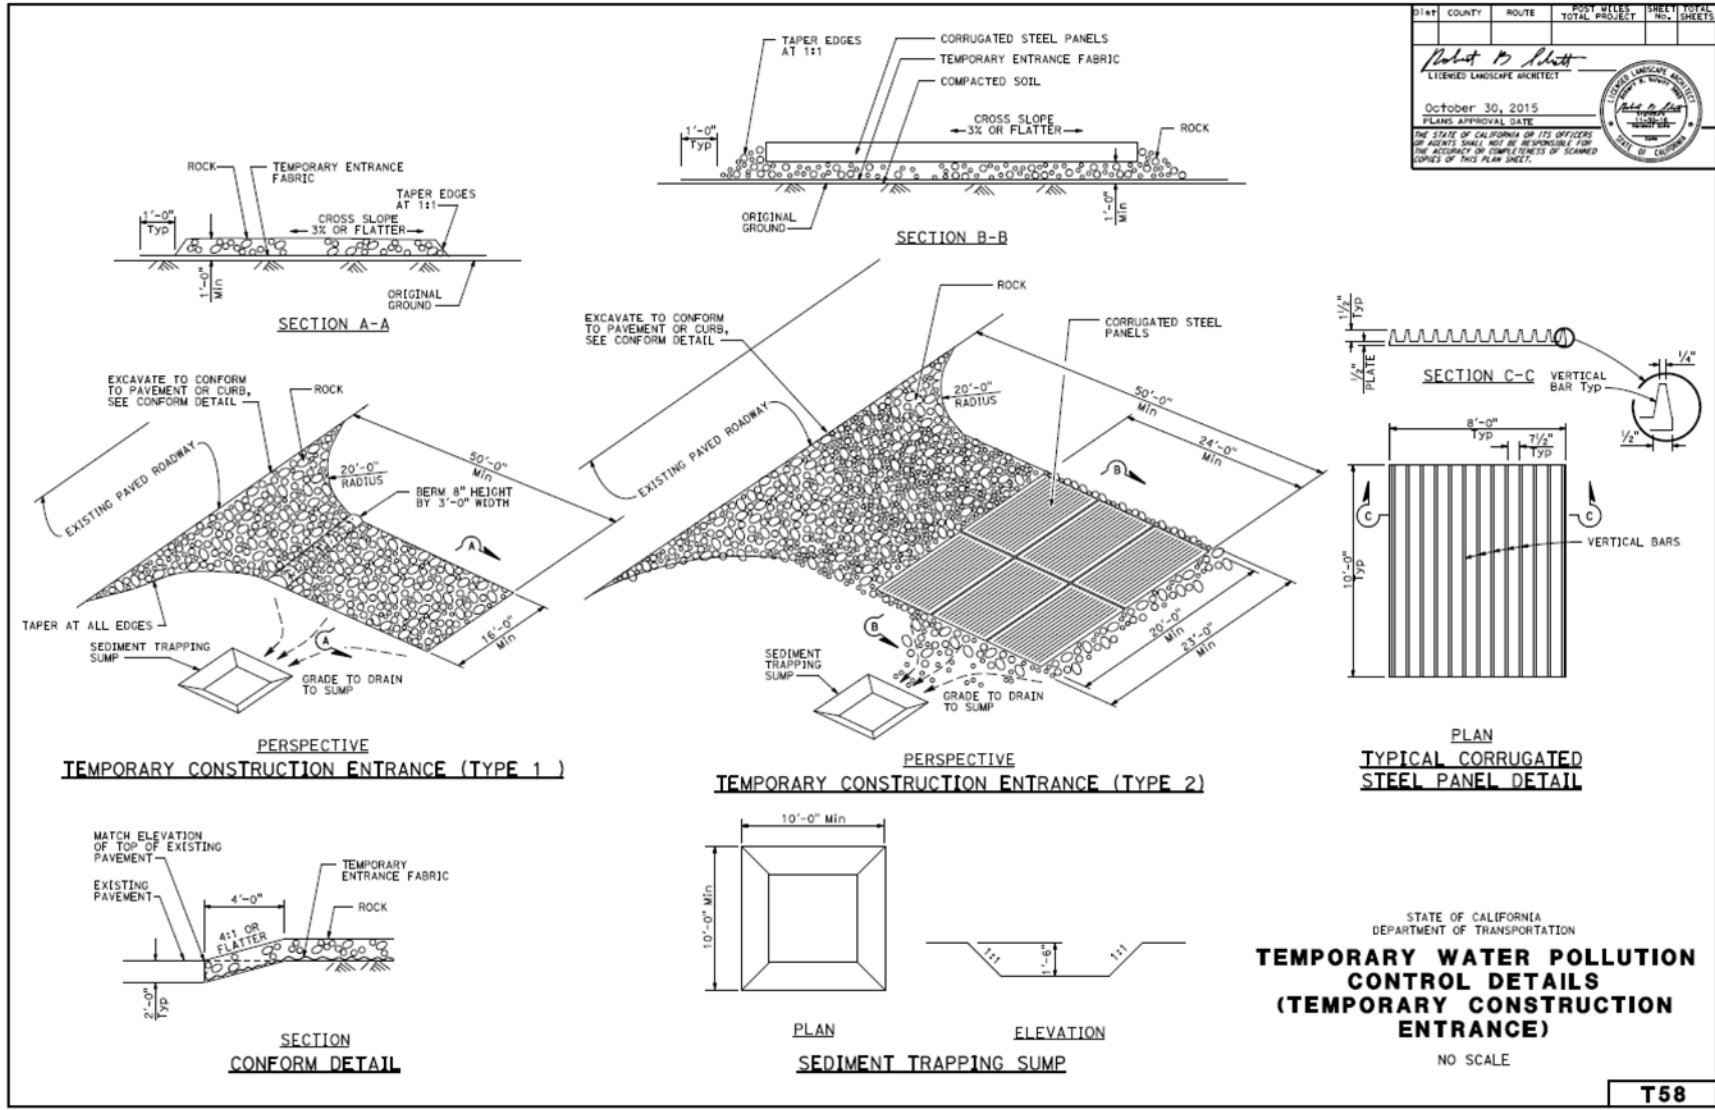

TC-1

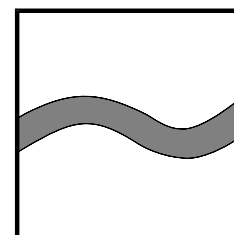

- Design a temporary construction entrance/exit to support the heaviest vehicles and equipment that will use it.
 - The use of asphalt concrete (AC) grindings is not allowed (high potential for leaching hydrocarbons) unless it complies with Section 6.8 of the 2016 Caltrans SWMP. Designate combination or single purpose entrances and exits to the construction site to maintain smooth flow of traffic.
- Maintenance and Inspection
- Inspect before and after each rainfall event, and weekly year round.
 - Inspect immediate site access roads daily, implement SC-7, “Street Sweeping” as needed.
 - Remove aggregate, separate, and dispose of sediment if temporary construction entrance is clogged with sediment.
 - Keep all temporary construction entrance/exit ditches clear.
- SWPPP or WPCP
- Tracking Control BMPs are to be included and discussed in section 500.3.4 or Section 600.2¹ for SWPPP and Section 30.2.3 of the WPCP.

¹Section 600.2 for the LTCGP SWPPP

Temporary Construction Entrance/ Exit

BMP Objectives	
Soil Stabilization	<input checked="" type="checkbox"/>
Sediment Control	<input type="checkbox"/>
Tracking Control	<input checked="" type="checkbox"/>
Wind Erosion Control	<input checked="" type="checkbox"/>
Non-Stormwater Management	<input type="checkbox"/>
Materials and Waste Management	<input type="checkbox"/>

Definition and Purpose A temporary construction roadway is a stabilized access road. It is designed for the control of dust and erosion created by vehicular tracking.

- Appropriate Applications**
- Use construction roadways and short-term detour roads:
 - Where mud tracking is a problem during wet weather.
 - Where dust is a problem during dry weather.
 - When road is adjacent to water bodies.
 - Where poor soils are encountered.
 - Where there are steep grades and additional traction is needed.

- Limitations**
- Materials will likely need to be removed prior to final grading and stabilization.
 - Site conditions will dictate design and need.
 - May not be applicable to very short duration projects.
 - Limit speed of vehicles to control dust.

Standards and Specifications

General Requirements

- Refer to Standard Specification Section 13-7.03 for temporary roadway standards.
- Class 10 RSP fabric must be used to line temporary construction roadways. Do not drive on the fabric until the rock is spread. Repair damaged fabric by placing new fabric over the damaged area with at least an 18-inch overlap on all edges.
- Type A or Type B rock may be used for temporary construction roadways. Type A and B rock must comply with Standard Specifications Section 13-7.03B(2). Coordinate materials with those used for stabilized construction entrance. Refer to TC-1, “Temporary Construction Entrance/Exit.”
- The use of cold mix asphalt, AC grindings, or blast furnace slag for stabilized construction roadway is not allowed (high potential to leach hydrocarbons) unless it complies with Section 6.8 of the 2016 Caltrans SWMP.

Installation

- Prepare the location for the temporary roadway as follows:
 - Remove vegetation and clear debris.
 - Grade the ground to a uniform plane.
 - Grade the ground surface to drain in a way that prevents runoff from leaving the construction site.
 - Remove sharp objects that could damage the fabric.
 - Compact the top 1.5 feet of soil to at least 90% relative compaction.
- Construct the temporary construction roadway as follows (standard plans attached below):
 - Place the fabric along the length of the roadway.
 - Overlap fabric ends by at least 12 inches.
 - Cover the fabric with rock within 24 hours.
 - Spread rock over the fabric in the direction of traffic.
 - Keep a 6-inch layer of rock over the fabric to prevent damage from the spreading equipment.

Other Considerations

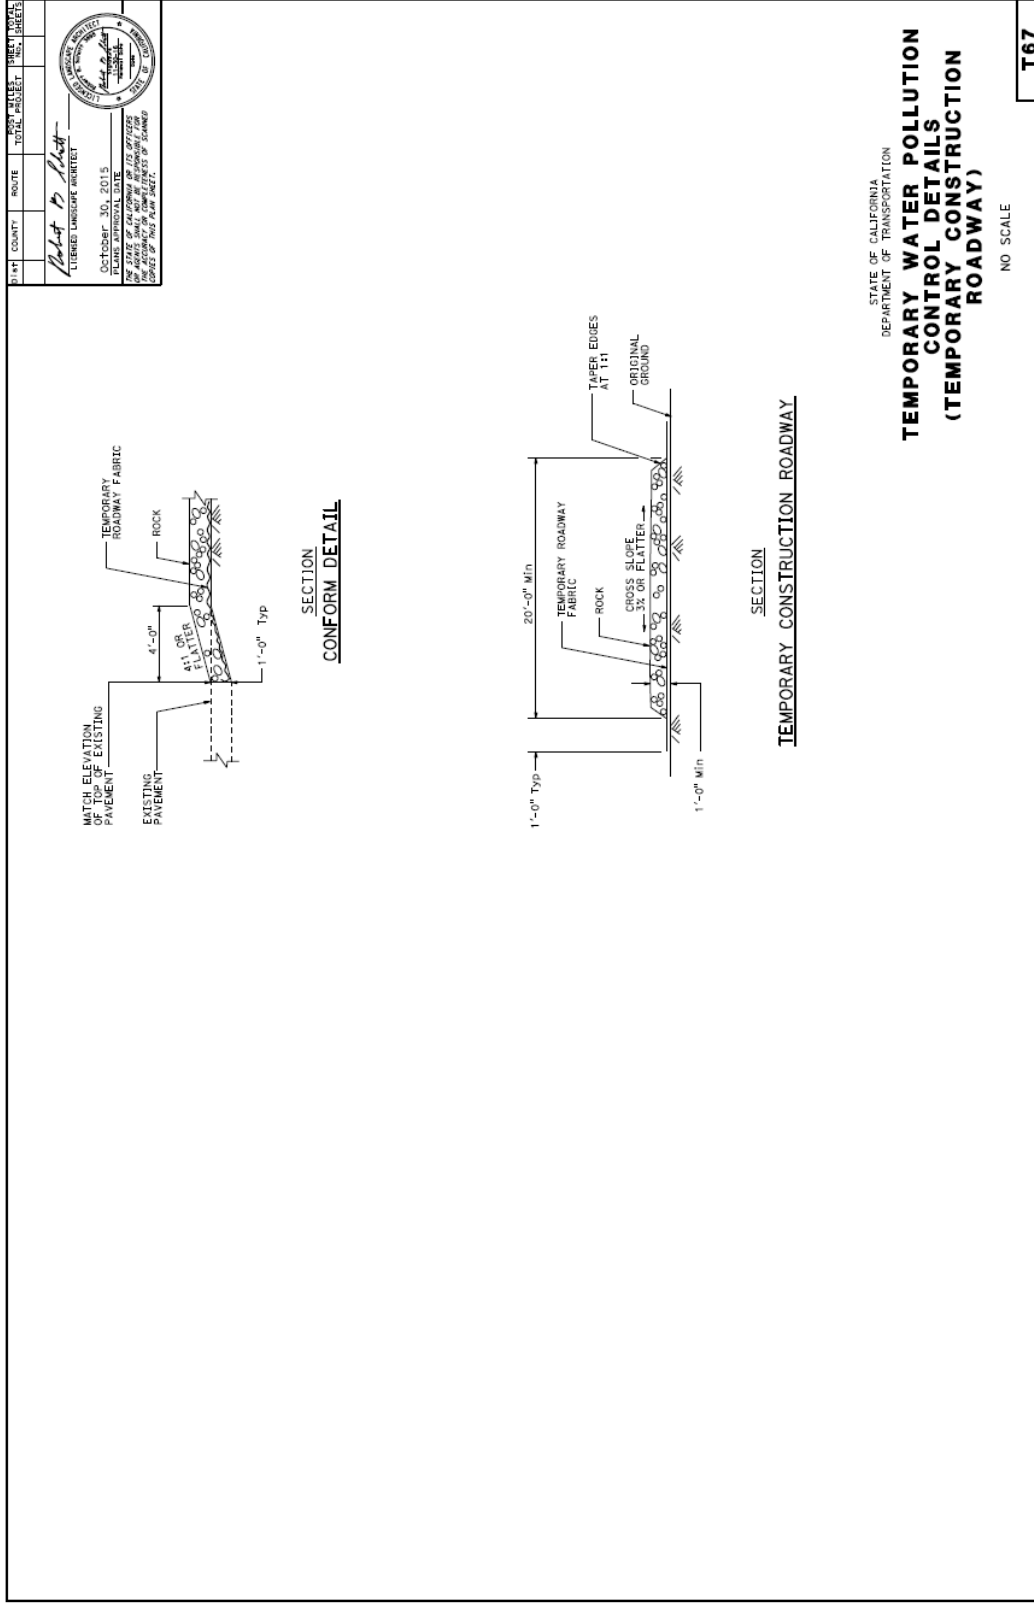

- Design stabilized access to support the heaviest vehicles and equipment that will use it.
 - Implement TC-1 “Temporary Construction Entrance/Exit” and TC-3 “Entrance/Outlet Tire Wash” in combination with temporary construction roadway for maximum tracking control.
- Maintenance and Inspection
- Inspect before and after each rainfall event, and weekly year round.
 - Inspect immediate site access roads daily, implement SC-7, “Street Sweeping” as needed.
 - Keep all temporary roadway ditches clear.
 - When no longer required, remove stabilized construction roadway and re-grade, re-vegetate and repair slopes.
- SWPPP or WPCP
- Tracking Control BMPs are to be included and discussed in Section 500.3.4 or Section 600.2 SWPPP¹ or Section 30.2.3 of the WPCP.

¹ Section 600.2 for the LTCGP SWPPP

BMP Objectives	
Soil Stabilization	<input type="checkbox"/>
Sediment Control	<input type="checkbox"/>
Tracking Control	<input checked="" type="checkbox"/>
Wind Erosion Control	<input type="checkbox"/>
Non-Stormwater Management	<input type="checkbox"/>
Materials and Waste Management	<input type="checkbox"/>

- | | |
|-------------------------------------|--|
| Definition and Purpose | A tire wash is an area located at stabilized construction access points to remove sediment from tires and undercarriages, and to prevent sediment from being transported onto public roadways. |
| Appropriate Applications | <ul style="list-style-type: none"> ■ Tire washes may be used on construction sites where construction vehicles may track dirt and mud onto public roads. ■ This BMP may be implemented on a project-by-project basis with other BMPs when determined necessary and feasible by the RE. |
| Limitations | <ul style="list-style-type: none"> ■ Requires a supply of wash water and way to collect or capture tire wash area runoff. ■ Requires a turnout or doublewide exit to prevent entering vehicles from driving through the wash area. |
| Standards and Specifications | <ul style="list-style-type: none"> ■ Require all employees, subcontractors, and others that leave the site with mud-caked tires and/or undercarriages to use the wash facility. ■ Incorporate with a temporary construction entrance/exit. See TC-1, “Temporary Construction Entrance/Exit.” ■ Construct on level ground when possible, on a pad of Type A or Type B rock. Either Class 8 or 10 RSP fabric should be placed below the rock. ■ Wash rack must be designed and constructed/manufactured for anticipated traffic loads. ■ Vehicle wash water is non-stormwater that requires management and disposal. See NS-8, “Vehicle and Equipment Cleaning.” ■ Provide a drainage ditch that will convey the runoff from the wash area to a sediment trapping device or similar device. The drainage ditch should be of sufficient grade, width, and depth to carry the wash runoff. ■ Implement BMP SC-7, “Street Sweeping” as needed. |

Maintenance and Inspection

- Refer to TC-1, “Temporary Construction Entrance/Exit,” for details regarding design and installation of construction entrance and exits to the project site.
- Inspect before, daily during extended rain events, after each rain event, and weekly year round.
- Inspect immediate site access roads daily, implement SC-7, “Street Sweeping” as needed.
- Remove accumulated sediment in wash rack and/or sediment trap to maintain system capacity and performance.
- Inspect routinely for damage and repair as needed. Document non-stormwater (sediment trapping device or similar device) in appropriate inspection form.

SWPPP or WPCP

- Temporary Entrance/Outlet Tire Wash is to be included and discussed in section 500.3.4 or Section 600.2¹ for a SWPPP or Section 30.2.3 of the WPCP.

¹ Section 600.2 applies for the LTCGP SWPPP

Section 7

Non-Storm Water Management BMP

7.1 Non-Storm Water Management

Non-stormwater management (BMPs) are source control BMPs that prevent pollution by limiting or reducing potential pollutants at their source before they come in contact with stormwater. These practices involve day-to-day operations of the construction site and are usually under the control of the Contractor. These BMPs are also referred to as “good housekeeping practices”, which involve keeping a clean, orderly construction site.

Table 7-1 lists the non-stormwater management BMPs. It is important to note that all these BMPs have been approved by Caltrans for statewide use and they must be implemented depending on the conditions/applicability of deployment described as part of the BMP.

Table 7-1. Non-Stormwater Management BMPs	
ID	BMP Name
NS-1	Water Conservation Practices
NS-2	Dewatering Operations
NS-3	Paving, Sealing, Sawcutting and Grinding Operations
NS-4	Temporary Stream Crossing
NS-5	Clear Water Diversion
NS-6	Illegal Connection and Illicit Discharge Detection and Reporting
NS-7	Potable Water/Irrigation
NS-8	Vehicle and Equipment Cleaning
NS-9	Vehicle and Equipment Fueling

NS-11	Pile Driving Operations
NS-12	Concrete Curing
NS-13	Material and Equipment Use Over Water
NS-14	Concrete Finishing
NS-15	Structure Demolition/Removal Over or Adjacent to Water

The remainder of this Section describe the working details for each of the non-stormwater management BMPs.

This page intentionally left blank.

Standard Symbol

BMP Objectives	
Soil Stabilization	<input type="checkbox"/>
Sediment Control	<input type="checkbox"/>
Tracking Control	<input type="checkbox"/>
Wind Erosion Control	<input type="checkbox"/>
Non-Stormwater Management	<input checked="" type="checkbox"/>
Materials and Waste Management	<input type="checkbox"/>

Definition and Purpose Water conservation practices are construction methods that minimize the use of water onsite or use water in a manner that avoids causing runoff, erosion and/or the discharge of pollutants to the storm drain system or receiving waters. Proper utilization of this BMP reduces or prevents non-stormwater discharges.

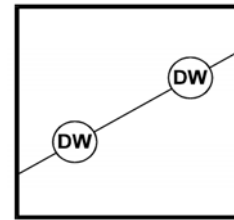

Appropriate Applications Water conservation practices are implemented on all construction sites wherever water is used.

Limitations

- If not implemented correctly, discharges may trigger reporting and monitoring requirements and delay construction work.

- Standards and Specifications**
- Keep water equipment in good working condition.
 - Ensure tracking controls are implemented in, near and around water truck filling areas.
 - Repair water leaks promptly.
 - Authorization is required for activities that could potentially discharge water into a storm drain system or receiving waters.
 - Avoid using water to clean construction areas. Do not wash paved areas with water. Paved areas and roadways should be swept and vacuumed in accordance with SC-7 “Street Sweeping.”
 - Apply water for dust control in accordance with Standard Specifications Section 10-4 Water Usage and BMP WE-1, “Wind Erosion Control.”
 - Direct construction water runoff to areas where it can infiltrate into the ground or be collected and reused.
 - Manage run-on to minimize contact with job site.

- Retain water spilled while filling water trucks within the designated water truck filling areas. Prevent tracking from water trucks and other equipment.
- Report discharges to the RE and the WPC Manager immediately.
- Maintenance and Inspection
 - Inspect water equipment areas at least weekly, prior to a forecasted rain event, daily during extended rain events and post-storm events.
 - Inspect non-stormwater BMPs daily when non-stormwater operations are ongoing.
 - Repair water equipment as needed.
- SWPPP or WPCP
 - Water Conservation Practices must be discussed in Section 500.3.5 of the SWPPP or Section 30.3.1 of the WPCP.

Standard Symbol

BMP Objectives	
Soil Stabilization	<input type="checkbox"/>
Sediment Control	<input type="checkbox"/>
Tracking Control	<input type="checkbox"/>
Wind Erosion Control	<input type="checkbox"/>
Non-Stormwater Management	<input checked="" type="checkbox"/>
Materials and Waste Management	<input type="checkbox"/>

- Definition and Purpose** Dewatering Operations are practices that manage the discharge of pollutants when non-stormwater and accumulated precipitation (stormwater) must be removed from a work location so that construction work may be accomplished.
- Appropriate Applications**
- These practices are implemented for the collection and discharge of non-stormwater and stormwater (accumulated rain water) from excavations or temporary containment facilities. Non-stormwater includes, but is not limited to, groundwater, dewatering of piles, water from cofferdams, water diversions, and water used during construction activities that must be removed from a work area.
 - Practices identified in this section are also appropriate for implementation when managing the removal of accumulated precipitation (stormwater) from depressed areas at a construction site.
 - Stormwater mixed with non-stormwater should be managed as non-stormwater.
- Limitations**
- Dewatering operations for non-stormwater will require, and must comply with, applicable local permits, project-specific permits, and regulations.
 - Site conditions will dictate design and use of dewatering operations.
 - Avoid dewatering discharges where possible by infiltrating, reusing the water for dust control, etc.
- Standards and Specifications**
- General Requirements**
- Dewatering shall be conducted in accordance with the Caltrans Field Guide to Construction Site Dewatering Manual and Standard Specification Section 13-4.03C
 - A dewatering and discharge work plan shall be submitted at least 15 days before the start of dewatering activities detailing the location of dewatering and discharge activities, quantity of water, equipment, and discharge point. The dewatering and discharge work plan must conform to Standard Specifications Section 13-4.01C.

- Dewatering discharges must not cause erosion, scour, or sedimentation that could impact natural bedding materials.
- Discharge the water within the project limits. Dispose of the water if it cannot be discharged within project limits due to site constraints or contamination.
- Do not discharge stormwater or non-stormwater that has an odor, discoloration other than sediment, an oily sheen, or foam on the surface. Immediately notify the RE upon discovering any such condition.
- The RWQCB may require a separate NPDES permit for a dewatering operation. These permits will have specific testing, monitoring, and discharge requirements.
- Discharges must comply with regional and watershed-specific discharge requirements.
- Additional permits or permissions from other agencies may be required for dewatering cofferdams or diversions.
- Dewatering records shall be kept with the SWPPP or WPCP and maintained for a minimum of 3 years after the construction project is terminated.
- The controls discussed in this BMP address sediment only. If the presence of polluted water with hazardous substances is identified in the contract, the contractor shall implement dewatering pollution controls as required by the contract documents. If the quality of water to be removed by dewatering is not identified as polluted in the contract documents, but is later determined by observation or testing to be polluted, the contractor shall notify the RE and comply with Standard Specifications Section 4-1.06, "Differing Site Conditions."

Sediment Treatment

- A variety of methods can be used to treat water during dewatering operations from the construction site. The size of particles present in the sediment and/or RWQCB Dewatering Permit or receiving water limitations on sediment are key considerations for selecting sediment treatment option(s); in some cases, the use of multiple devices may be appropriate.
- Refer to the Sediment Treatment Options described in Appendix B of the Field Guide to Construction Site Dewatering to determine the optimal method to achieve sediment removal.
- Refer to the applicable project dewatering and/or stormwater permit for monitoring and sampling forms and requirements.
- Inspect dewatering operation areas at least weekly, prior to a forecasted rain event, daily during extended rain events and post-storm events.
- Accumulated sediment removed during the maintenance of a dewatering device may be disposed of outside the right-of-way in conformance with Standard Specifications Section 14-10 Solid Waste Disposal and Recycling.
- Accumulated sediment that is commingled with other pollutants must be disposed of in accordance with all applicable laws and regulations.

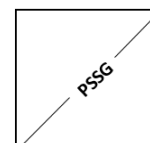

Maintenance and Inspection

- The WPC Manager must take immediate action to prevent non-stormwater discharges from being discharged.
- SWPPP or WPCP
- Dewatering Operations must be discussed in Section 500.4.1 of SWPPP and specific sample collection, collection and parameters in Section 700.2.3.1 if required by a specific RWQCB Dewatering Permit or Section 30.3.1 of the WPCP.

Paving, Sealing, Sawcutting, and Grinding Operations

NS-3

Standard Symbol

BMP Objectives	
Soil Stabilization	<input type="checkbox"/>
Sediment Control	<input type="checkbox"/>
Tracking Control	<input type="checkbox"/>
Wind Erosion Control	<input type="checkbox"/>
Non-Stormwater Management	<input checked="" type="checkbox"/>
Materials and Waste Management	<input checked="" type="checkbox"/>

Definition and Purpose Procedures and practices for conducting paving, sealing, sawcutting, and grinding activities to minimize the transport of pollutants to the storm drain system or receiving water body.

Appropriate Applications These procedures are implemented where operations such as paving, surfacing, resurfacing, grinding, coring, grooving, sealing and sawcutting generate spoils, residue, or process water that may pollute storm water runoff or discharge to the storm drain system or receiving water body.

- Limitations**
- Activities related to paving, sealing, sawcutting, grooving, and grinding operations should be limited when precipitation is forecasted to prevent the triggering for visible and non-visible pollutant monitoring.
 - Discharges of freshly paved surfaces can raise pH and trigger permit violations.

Standards and Specifications **General Requirements**

- Refer to Standard Specifications Section 13-4.03E (7) Paving, Sealing, Sawcutting, Grooving, and Grinding Activities.
- Do not allow the following materials to enter storm drain system and receiving waters: cementitious material, asphaltic material, aggregate or screenings, sawcutting, grooving, and grinding residue, pavement chunks, shoulder backing, methacrylate resin, and sandblasting residue. This list is not exhaustive.
- Drainage inlets shall be protected and linear sediment barriers (such as silt fences, gravel bag berms, or fiber rolls) shall be used to protect receiving waters during operations related to paving, sealing, sawcutting, or grinding.

Paving, Sealing, Sawcutting, and Grinding Operations

NS-3

- Drainage inlets and manholes shall be protected during application of seal coat, tack coat, slurry seal, and/or fog seal. Refer to SE-10, “Temporary Drainage Inlet Protection.”
- Whenever precipitation is forecasted, limit paving, sawcutting, and grinding to places where runoff can be captured. Grinding or grooving of pavement shall not be conducted when precipitation is forecasted unless runoff can be captured.
- Seal coat, tack coat, slurry seal, or fog seal shall not be applied when precipitation is forecasted during the application or curing period.
- Slurry shall be removed with a vacuum immediately after it is produced and shall be prevented from running off the pavement or into lanes open to traffic.
- The residue from grooving and grinding activities shall be collected with a vacuum attachment on the grinding machine and shall be prevented from flowing across the pavement. See also WM-8, “Concrete Waste Management,” and WM-10, “Liquid Waste Management.”
- Material removed from existing roadways may be stockpiled, if allowed, away from drainage inlets and receiving waters in accordance with BMP WM-3, “Stockpile Management” and Standard Specification 13-4.03C(3) Stockpile Management.
- Drip pans or absorbent materials shall be placed under paving equipment when not in use. Refer to WM-4, “Spill Prevention and Control.” Equipment shall be cleaned in accordance with NS-8, “Vehicle and Equipment Cleaning.”
- Do not coat asphalt trucks and equipment with substances that contain soap, foaming agents, or toxic chemicals.

Asphalt Concrete and Concrete Pavement Handling

- Prevent sand and gravel from entering streets, storm drains, and receiving waters.
- Substances used to coat asphalt transport trucks, asphalt trucks, and asphalt spreading equipment shall not contain soap, foaming agents, or toxic chemicals.
- Asphalt spoils must be recycled or disposed of in accordance with WM-5, “Solid Waste Management,” and/or WM-6, “Hazardous Waste Management.”
- AC and PCC grindings, pieces, or chunks approved by the RE for reuse in embankments or shoulder backing shall not be at risk of entering storm drain systems or receiving waters.
- Temporarily protect inlets and receiving waters until the structure is stabilized or permanent controls are in place.

Paving, Sealing, Sawcutting, and Grinding Operations

NS-3

- The reuse of AC or PCC grindings, pieces, or chunks as road base must be placed at least five feet above the seasonal high groundwater elevation with the approval of the RE. Shoulder backing containing Recycled Asphalt Pavement (RAP) shall not be placed within 100 feet measured horizontally from a culvert, watercourse, or bridge and must comply with the 2016 SWMP.
- During chip seal application and sweeping operations, petroleum or petroleum covered aggregate must not be allowed to enter storm drains or receiving waters. Temporarily protect inlets and receiving waters until stabilized.
- Clean asphalt-coated equipment off-site whenever possible. When cleaning dry, hardened asphalt from equipment, manage hardened asphalt debris in accordance with WM-5, “Solid Waste Management,” and/or WM-6, “Hazardous Waste Management,” and NS-8 “Vehicle and Equipment Cleaning” whichever is applicable.
- Allow aggregate rinse to settle. Then, either allow rinse water to dry in a temporary pit as described in WM-8, “Concrete Waste Management,” or dispose in accordance with WM-5, “Solid Waste Management.”

Thermoplastic Striping and Pavement Markers

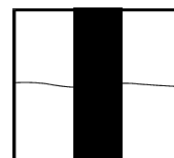

- Contractor shall not pre-heat, transfer, or load thermoplastic within 50 feet of drainage inlets or receiving waters.
- Do not unload, transfer, or load bituminous material for pavement markers within 50 feet of drainage inlets or receiving waters.
- All thermoplastic striper and pre-heater equipment shutoff valves shall be inspected to ensure that they are working properly to prevent thermoplastic from leaking.
- The pre-heater shall be filled carefully to prevent splashing or spilling of hot thermoplastic. Leave six inches of space at the top of the pre-heater container when filling thermoplastic to allow room for material to move when the vehicle is deadheaded.
- Melting tanks shall be loaded with care, a minimum of six inches of freeboard in case of splashing when vehicle is deadheaded. When servicing or filling melting tanks, ensure all pressure is released before removing lids to avoid spills.
- Immediately remove drips, overspray, improper markings, paint, and thermoplastic tracked by traffic with an authorized method.
- Collect and dispose of bituminous material from the roadway after removal of markers in accordance with WM-5, “Solid Waste Management.”

Paving, Sealing, Sawcutting, and Grinding Operations

NS-3

- Clean truck beds daily of loose debris and melted thermoplastic. When possible, recycle thermoplastic material. Thermoplastic waste shall be disposed of in accordance with BMP WM-5, “Solid Waste Management” and/or WM-6, “Hazardous Waste Management, as applicable.
- Maintenance and Inspection
- Inspect and maintain machinery and BMPs regularly to minimize leaks and drips.
 - Ensure that employees and subcontractors are implementing appropriate measures during paving operations.
 - If project operations trigger the IGP (industrial operations located within project limits regardless of whether the facility is within or outside Caltrans’ right-of-way and outside Caltrans’ right-of-way but within project limits), ensure that any run-on or run-off from IGP activities does not have potential to create pollution onto Caltrans right-of-way. Refer to 2016 SWMP Section 7.2 for additional guidance.
- SWPPP or WPCP
- Paving, Sealing, Sawcutting and Grinding Operations must be discussed in Section 500.4 of the SWPPP or Section 30.3.1 of the WPCP.

Definition and Purpose A temporary stream crossing is a structure placed across a stream or water body that allows vehicles to cross during construction and minimize, reduce, or manage erosion and downstream sedimentation caused by the vehicles.

- Appropriate Applications**
- Where appropriate regulatory permits have been secured and requirements strictly followed.
 - Where construction equipment or vehicles need to frequently cross a waterway.
 - When alternate access routes impose significant constraints.
 - When crossing perennial streams or waterways causes significant erosion.
 - Where construction activities will not last longer than one year.

- Limitations**
- Typically, stream crossings require regulatory permits such as RWQCB 401 Certification, U.S. Army Corps of Engineers 404 permit and approval by California Department of Fish and Wildlife.
 - If numerical-based water quality standards are mentioned in any of these regulatory permits, monitoring and water quality sampling may be required and must comply with Standard Specification 13-1.01C (4) Water Quality Monitoring or the contract special provisions. If monitoring related to these numerical-based water quality standards is not addressed in the contract documents, contact the RE.
 - Ensure that project specific requirements from regulatory permits for the installation, removal or restoration of creek banks are fully implemented.
 - Will usually disturb the waterway during installation and removal.

- Installation may require dewatering or temporary diversion of the stream. See NS-2, “Dewatering Operations” and NS-5, “Clear Water Diversion.”
- May become a constriction in the waterway, which can obstruct flood flow and cause flow backups or washouts. If improperly designed, flow backups can increase the pollutant load through washouts and scouring.
- Use of natural or other gravel in the stream for construction of Cellular Confinement System (CCS) ford crossing will be contingent upon approval by fisheries agencies.
- Ford crossings may degrade water quality due to contact with vehicles and equipment.
- CCS should not be used in excessively high or fast flows.
- Upon completion of construction activities, CCS blocks must be removed from stream.

Standards and Specifications

General Considerations

Location of the temporary stream crossing shall address:

- Site selection where erosion potential is low.
- Areas where the side slopes from highway runoff will not spill into the side slopes of the crossing.

The following types of temporary stream crossings shall be considered:

- Culverts - Used on perennial and intermittent streams.
- Fords - Appropriate during the dry season in arid areas. Used on dry washes and ephemeral streams, and low flow perennial streams. CCS, a type of ford crossing is also appropriate for use in streams.
- Bridges - Appropriate for streams with high flow velocities, steep gradients and/or where temporary restrictions in the channel are not allowed.

Design and installation requires knowledge of stream flows and soil strength. Designs shall be prepared under direction of, and approved by, a registered civil and/or structural engineer. Both hydraulic and construction loading requirements shall be considered with the following:

- Comply with the requirements for culvert and bridge crossings, as contained in the Caltrans Highway Design Manual, particularly if the temporary stream crossing will remain during high flow periods.

- Provide stability in the crossing and adjacent areas to withstand the design flow. The design flow and safety factor shall be selected based on careful evaluation of the risks due to over topping, flow backups, or washout.
- Avoid using oil, AC or other potentially hazardous waste materials for the temporary traveled surface over the stream crossing.

Construction Considerations

- Stabilize construction roadways, adjacent work area and stream bed against erosion.
- Construct during dry periods to minimize stream disturbance and reduce costs.
- Construct at or near the natural elevation of the stream bed to prevent potential flooding upstream of the crossing.
- Install temporary sediment control BMPs in accordance with sediment control BMPs presented in Section 4 to minimize embankment scour due to flow conditions.
- Vehicles and equipment shall not be driven, operated, fueled, cleaned, maintained, or stored in the wet or dry portions of a water body where wetland vegetation, riparian vegetation, or aquatic organisms may be destroyed, except as authorized by the construction project regulatory permits, as necessary to complete the work.
- Temporary water body crossings and encroachments shall be constructed to minimize scour. Cobbles used for temporary water body crossings or encroachments shall be clean, rounded river cobble.
- The exterior of vehicles and equipment that will encroach on the water body within the project shall be maintained free of grease, oil, fuel, and residues.
- Disturbance or removal of vegetation shall not exceed the minimum necessary to complete operations. Precautions shall be taken to avoid damage to vegetation. Disturbed vegetation shall be replaced with the appropriate soil stabilization measures. Appropriate use of ESA fencing should be conducted and maintained in accordance with SS-2 “Preservation of Existing Vegetation.”
- Riparian vegetation, when removed pursuant to the provisions of the work, shall be cut off no lower than ground level to promote rapid re-growth. Access roads and work areas built over riparian vegetation shall be covered by a sufficient layer of clean river run cobble to prevent damage to the underlying soil and root structure. The cobble shall be removed upon completion of project activities.
- Any temporary artificial obstruction placed within flowing water shall only be built from material, such as clean gravel, that will cause little or no siltation.

- Drip pans shall be placed under all vehicles and equipment placed on docks, barges, or other structures over water bodies when the vehicle or equipment is planned to be idle for more than one hour.

Specific Considerations

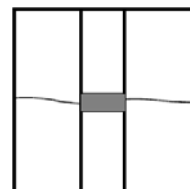

- Culverts are relatively easy to construct and able to support heavy equipment loads.
- Fords are the least expensive of the crossings, with maximum load limits.
- Temporary fords are not appropriate if construction will continue through a period of high flows if thunderstorms are likely, or if the stream is perennial.
- CCS crossing structures consist of clean, washed gravel and cellular confinement system blocks. CCS are appropriate for streams that would benefit from an influx of gravel; for example, salmonid streams, streams or rivers below reservoirs, and urban, channelized streams. Many urban stream systems are gravel-deprived due to human influences, such as dams, gravel mines, and concrete channels.
- CCS allow designers to use either angular or naturally-occurring, rounded gravel, because the cells provide the necessary structure and stability. In fact, natural gravel is optimal for this technique, because of the habitat improvement it will provide after removal of the CCS.
- A gravel depth of 6 to 12 inches for a CCS structure is sufficient to support most construction equipment.
- An advantage of a CCS crossing structure is that relatively little rock or gravel is needed, because the CCS provides the stability.
- Bridges are generally more expensive to design and construct, but provides the least disturbance of the stream bed and constriction of the waterway flows.

Maintenance and Inspection

- Periodic removal of debris behind fords, in culverts, and under bridges.
- Replacement of lost protective aggregate from inlets and outlets of culverts.
- Removal of temporary crossing promptly when it is no longer needed.
- Inspection shall, at a minimum, occur weekly and after each significant rainfall, and include:
 - Checking for blockage in the channel, debris buildup in culverts or behind fords, and under bridges.
 - Checking for erosion of abutments, channel scour, riprap displacement, or piping in the soil.

- Checking for structural weakening of the temporary crossing, such as cracks, and undermining of foundations and abutments.
 - The WPC Manager or QSP must ensure that stream crossings do not create potential for sediment laden discharge or other materials onto the waterbody.
- SWPPP or WPCP
- Temporary Stream Crossing must be discussed in Section 500.4 of the SWPPP or Section 30.3 of the WPCP.

Definition and Purpose Clear water diversion consists of a system of structures and measures that intercept surface water runoff upstream of a project site, transport it around the work area, and discharge it downstream with minimal water quality degradation from either the project construction operations or the construction of the diversion. Clear water diversions are used to reduce sediment pollution from construction work occurring in or adjacent to water.

Isolation techniques are clear water diversion methods that isolate near shore work from a waterbody. Structures commonly used as part of this system include diversion ditches, berms, dikes, slope drains, rock, gravel bags, wood, sheet piles, aqua barriers, cofferdams, filter fabric or turbidity curtains, drainage and interceptor swales, pipes, or flumes.

- Appropriate Applications**
- A clear water diversion is typically implemented where appropriate permits have been secured and work must be performed in a live stream or water body. Work in jurisdictional waters typically require the following, at a minimum, Clean Water Act Section 404, Clean Water Act Section 401 (RWQCB Water Quality Certification), and Fish and Game Code Section 1600 permits.
 - Clear water diversions are appropriate for isolating construction activities occurring within or near a water body such as streambank stabilization, or culvert, bridge, pier or abutment installation. They may also be used in combination with other methods, such as clear water bypasses and/or pumps.
 - Implement SS-12 “Streambank Stabilization” to minimize impacts to streambanks.

- Where working areas encroach on live streams, barriers adequate to prevent the flow of muddy water into streams should be constructed and maintained between working areas and streams. During construction of the barriers, muddying of streams should be held to a minimum.
- Channel diversions are appropriate for small stream where there is adequate right of way to create a temporary channel around a construction work area, and geosynthetics or rock can be used to handle the shear stresses associated with the expected flows.
- Berms are appropriate for small perennial, intermittent, or ephemeral streams with temporary culverts or pipe diversions. Berms may also be used to shift flows to one side or the other within a channel.
- Gravel bag berms (SC-6 “Gravel Bag Berms”) are appropriate for smaller streams where the hydraulic forces and water pressure can be adequately addressed with the weight of gravel-filled bags and plastic sheeting. This method results in a cofferdam-like isolation from the receiving water.
- Cofferdams are appropriate for small streams and lakes to confine flows to one side, create a dry work area, or to berm entire small streams. Typically, this terminology is used in association with structures at Caltrans, though some inflatable cofferdams may be used for smaller applications.
- Pumped diversions are suitable for short-term projects in intermittent and low flow streams. Excavation of a temporary bypass channel, or passing the flow through a pipe (called a “flume”) is appropriate for the diversion of streams less than 20 ft wide, with flow rates less than 100 cfs.
- Piped diversions are appropriate for short-term projects with little base flow.
- Water quality monitoring must typically be performed before and during in-water work, including the installation, operation, and removal of clear water diversions. Follow the requirements outlined in the Standard Specification or special provisions.

Limitations

- Diversion/encroachment activities will usually disturb the waterway during installation and removal of diversion structures.
- Specific permit requirements or mitigation measures, such as those required by the U.S. Army Corps of Engineers, California Department of Fish and Wildlife, Federal Emergency Management Agency (FEMA), Regional Water Quality Control Board (RWQCB), etc. may be included in contract documents because of clear water diversion/encroachment activities.
- Diversion/encroachment activities may constrict the waterway, obstruct flood flows and cause flooding or washouts. Diversion structures should not be installed without identifying potential impacts to the stream channel.

- Diversion or isolation activities should not completely dam streamflow.
- The designer should consider the size, depth of water, and risks for temporary stream diversion. Use this BMP and specification for small streams and low risk projects.
- Cofferdams and more elaborate systems should be designed by engineering services staff with the appropriate structural background or by the contractor. The design decision and design parameters should be coordinated by the PDT, so that all permitting and highway design requirements are met.
- Dewatering and removal may require additional sediment control or water treatment (See NS-2, “Dewatering Operations”).
- Heavy equipment driven in wet portions of a water body to accomplish work should be completely clean of petroleum residue, and water levels should be below the gearboxes of the equipment in use, or lubricants and fuels are sealed such that inundation by water should not result in leaks.
- Mechanical equipment operated in the water shall not be submerged to a point above any axle of said mechanical equipment.
- Excavation equipment buckets may reach out into the water to remove or place fill materials. Only the bucket of the crane/ excavator/backhoe may operate in a water body. The main body of the crane/excavator/backhoe shall not enter the water body, except as necessary to cross the stream to access the work site.
- Stationary equipment such as motors and pumps, located within or adjacent to a water body, shall be positioned over drip pans.
- Equipment shall not be parked below the high-water mark unless allowed by a regulatory agency permit or approval.
- Drip pans shall be placed under all vehicles and equipment placed on docks, barges, or other structures over water bodies when the vehicle or equipment is planned to be idle for more than one hour.
- Where possible, avoid or minimize diversion/encroachment impacts by scheduling construction during periods of low flow or when the stream is dry. See also the project special provisions for scheduling requirements.
- Scheduling shall also consider seasonal releases of water from dams, fish migration and spawning seasons, and water demands due to crop irrigation.
- Materials and equipment should be moved from diversion work area prior to forecasted rain events to prevent non-storm water discharges.

Standards and Specifications

General Requirements

- Most small stream diversions can be designed by the district and coordinated with the HQ OHSD. In many cases the diversion can be located on the plan sheet referencing the non-standard specification for Temporary Creek Diversion.
- Many projects will have multiple culverts, so it may be appropriate to develop a table of the lump sum costs for each system, this should be provided to the RE to help review the Temporary Creek Diversion System Plan, to help them determine if all needed items are included.
- The types of diversion for small to medium sized streams may include:
 - Pumped systems
 - Temporary culverts
 - Inflatable coffer dams (Consult HQ OHSD for specification)
- For larger (large rivers, lakes, bays, and ocean areas) temporary creek diversions that have a higher risk to worker safety and a more extensive design is required to address the forces for the depth and flow of the water, the district's structures representative should be consulted for the design (e.g., larger rivers where coffer dams are required). The engineer must consult and follow the Caltrans Engineering Services Shoring Guidance and consult with Construction as the owner of the specification.
 - Diversion can be constructed from timber, soil, or steel. But in most cases are designed and constructed with steel sheet piles. Refer to 19-3.03C Cofferdams (sheet piles).
 - Guidance: *Caltrans Shoring Guide* (Engineering Services)

Dewatering: *Field Guide to Construction Site Dewatering*, NS-2 "Dewatering Operations," and Section 13-4.03G of the Standard Specifications for use with coffer dams or other large in-water work.
 - May need to treat or control seepage water prior to discharge, consult appropriate requirements for treatment design needs.
- When any artificial obstruction is being constructed, maintained, or placed in operation, sufficient water shall, at all times, be allowed to pass downstream to maintain aquatic life downstream.
- Disturbance or removal of vegetation shall not exceed the minimum necessary to complete operations.

- Disturbed vegetation shall be replaced with the appropriate soil stabilization measures and in accordance with the project's special provisions.
- Riparian vegetation, when removed pursuant to the provisions of the work, shall be cut off no lower than ground level to promote rapid re-growth. Access roads and work areas built over riparian vegetation shall be covered by a sufficient layer of clean river run rock to prevent damage to the underlying soil and root structure. The rock shall be removed upon completion of project activities.
- Construct diversion structures with materials free of potential pollutants such as soil, silt, sand, clay, grease, or oil.
- Clear water diversions incorporating clean washed gravel may be appropriate for use in salmon spawning streams.
- Coordination with a variety of functional units at the Department may be required to implement this BMP.

Design Considerations

- Does the construction of the temporary diversion system cause more environmental damage to the riparian, wetland, or 100-year floodplain area, than to construct the project without the diversion BMP? This is a consideration for all projects, but is usually appropriate for short term construction projects for temporary or ephemeral streams, where scheduling of the project when the stream is dry, may be more effective than the construction of a large diversion system in a sensitive environmental area, where construction equipment could disturb fragile vegetation, roots, sensitive species, soil structure, and root systems.
- Stream hydrology considerations include: Stream channel geometry, tributary watershed area, stream bed material, and predicted flow rates during construction. Follow methods in HDM Section 810 for the appropriate methods and rates for sizing the temporary diversion system.
- Sizing the temporary diversion. In the past many temporary diversion system guidance documents required mandatory minimum return storms for sizing the systems, for example the 2-year, 5-year, or 10-year, 24-hour return period. This can result in temporary diversion system as large as the drainage system they are replacing and result in large impacts to the stream riparian zone, with large disturbed soil areas. Overly conservative approaches for the hydrology sizing to protect the environment can inadvertently cause other impacts to the environment for its construction. Each project should be sized for the appropriate risks and should be based on regulatory restrictions.
- In coordination with District Hydraulics, consider the consequences for diversion exceedance including; public and work safety, environment, legal, regulatory permit requirements, costs, space, and schedule.

Hydrology Sizing Methods

- The sizing of clear water diversion systems varies by the time of year, local hydrology, and duration of the diversion. If there is a prescriptive storm size in a permit document, then design to the required event size. A 2-year, 24-hour storm event has been used by many as a default event, but more recent studies have shown that this may oversize the system and cause more disturbance in the sensitive stream zone than is necessary.
- Diversion structures must be adequately designed to accommodate fluctuations in water depth or flow volume due to tides, storms, flash floods, etc. Careful analysis of the local hydrology history and risk analysis is required to minimize the diversion impacts.

Temporary Diversions/Encroachments

- Construct diversion channels in accordance with SS-9, “Earth Dikes/Drainage Swales, and Ditches.”
- In high flow velocity areas, stabilize slopes of embankments and diversion ditches using an appropriate liner, in accordance with SS-12 “Streambank Stabilization,” and SS-7, “Plastic Covers & Rolled Erosion Control Products,” or use rock slope protection, as described in Standard Specifications Section 72-2, “Rock Slope Protection.”
- Where appropriate, use natural streambed materials such as large cobbles and boulders for temporary embankment/slope protection, or other temporary soil stabilization methods.
- Provide for velocity dissipation at transitions in the diversion, such as the point where the stream is diverted to the channel and the point where the diverted stream is returned to its natural channel. See also SS-10, “Outlet Protection/Velocity Dissipation Devices.”

Temporary Dry Construction Areas

- When dewatering behind temporary structures to create a temporary dry construction area, such as cofferdams, pass pumped water through a sediment settling device, such as a portable tank, settling basin, or Active Treatment System if necessary, before returning water to the water body; see NS-2, “Dewatering Operations” and Standard Specification 13-8 “Temporary Active Treatment System.”
- If the presence of polluted water or sediment is identified in the contract, the contractor shall implement dewatering pollution controls as required by the contract documents. If the quality of water or sediment to be removed while dewatering is not identified as polluted in the contract documents, but is later determined by observation or testing to be polluted, the contractor shall notify the RE and comply with Standard Specifications Section 4-1.06 “Differing Site Conditions.”

- Any substance used to assemble or maintain diversion structures, such as form oil, shall be non-toxic and non-hazardous.
- Any material used to minimize seepage underneath diversion structures, such as grout, shall be non-toxic, non-hazardous, and as close to a neutral pH as possible.

Instream Construction Sediment Control

There are three different options currently available for reducing turbidity while working in a stream or river. The stream can be:

- Isolated from the area in which work is occurring by means of a water barrier.
- The stream can be diverted around the work site through a pipe or temporary channel.
- One can employ construction practices that minimize sediment suspension.
- The highest hazard for sedimentation from instream construction generally occurs when the sediment control structure is being installed and when it is being removed. Generally, the best time to install the stream isolation or diversion structure is when the stream flow is low. Conversely, the optimum time to remove in-stream diversion or isolation structures may be during the rising limb of a storm hydrograph. A probable “worst time” to release high TSS into a stream system with diminishing aquatic habitat might be when the stream flow is very low; summer low flow, for example. During these times, the flow may be low while the biological activity in the stream is very high. On the other hand, the addition of short-term spike in TSS or sediment during a big storm discharge might have a relatively low impact on the aquatic habitat or turbidity because the stream is already turbid, and the stream energy is capable of transporting both suspended solids, and large quantities of bedload through the system.

Techniques to Minimize Total Suspended Solids (TSS)

- Padding - Padding laid in the stream below the work site may trap some solids that are deposited in the stream during construction. After work is done, the padding is removed from the stream, and placed on the bank to assist in revegetation.
- Clean, washed gravel - Using clean, washed gravel decreases solid suspension, as there are fewer small particles deposited in the stream.

- Excavation using a large bucket - Each time a bucket of soil is placed in the stream a portion is suspended. Approximately the same amount is suspended whether a small amount of soil is placed in the stream, or a large amount. Therefore, using a large excavator bucket instead of a small one, will reduce the total amount of soil that washes downstream.
- Use of dozer for backfilling - Using a dozer for backfilling instead of a backhoe follows the same principles – the fewer times soil is deposited in the stream, the less soil will be suspended.
- Partial dewatering with a pump - Partially dewatering a stream with a pump reduces the amount of water, and thus the amount of water that can suspend sediment.

Washing Fines

- Partial Washing fines is an “in-channel” sediment control method, which uses water, either from a water truck or hydrant, to wash any stream fines that were brought to the surface of the channel bed during restoration, back into the interstitial spaces of the gravel and cobbles. This technique is useful in both intermittent or ephemeral stream channels with gravelly to cobbly substrate and may be useful in perennial streams just prior to removing isolation structures.
- The purpose of this technique is to reduce or eliminate the discharge of sediment from the channel bottom during the first seasonal flows, or “first flush.” Sediment should not be allowed into stream channels; however, occasionally in-channel restoration work will involve moving or otherwise disturbing fines (sand and silt-sized particles) that are already in the stream, usually below bank-full discharge elevation. Subsequent re-watering (resumption of flows) of the channel can result in a plume of turbidity and sedimentation.
- This technique washes the fines back into the channel bed. Bedload materials, including gravel cobbles, boulders and those fines, are naturally mobilized during higher storm flows. This technique is intended to delay the discharge until the fines would naturally be mobilized.
- This technique should be used when construction work is required in channels. It is especially useful in intermittent or ephemeral streams in which work is performed “in the dry,” and which subsequently become re-watered.

Prior to using this technique consider the following:

- The stream must have sufficient gravel and cobble substrate composition.
- The use of this technique requires consideration of time of year and timing of expected stream flows.
- The optimum time for the use of this technique is in the fall, prior to winter flows.

- Consultation with, and approval from the Department of Fish and Wildlife and the Regional Water Quality Control Board may be required.

The following items should be considered when preparing project plans and specifications when this technique is used:

- Apply sufficient water to wash fines, but not cause further erosion or runoff.
- Apply water slowly and evenly to prevent runoff and erosion.
- Consult with Department of Fish and Wildlife and the Regional Water Quality Control Board for specific water quality requirements of applied water (e.g., chlorine).

Isolation Techniques Isolation techniques are methods that isolate near shore work from a waterbody. Techniques include sheet pile enclosures, inflatable cofferdams like Aqua Dam, berms or gravel bag berms (see SC-6, “Gravel Bag Berm”) with impermeable membrane or plastic sheeting, gravel bags, cofferdams, and K-rail.

Filter Fabric Isolation Technique

A filter fabric isolation structure is a temporary structure built into a waterway to enclose a construction area and reduce sediment pollution from construction work in or adjacent to water. This structure is composed of filter fabric, gravel-filled bags, and steel t-posts.

- Filter fabric may be used for construction activities such as streambank stabilization, or culvert, bridge, pier or abutment installation. It may also be used in combination with other methods, such as clean water bypasses and/or pumps.
- This method involves placement of gravel bags or continuous berms to “key-in” the fabric, and subsequently staking the fabric in place.
- If spawning gravel (gravel between 1 and 4 inches) is used, all other components of the isolation can be removed from the stream, and the gravel can be spread out and left as salmon spawning habitat if permitted in the project’s 404 permit. Whether spawning gravel or other types of gravel are used, only clean washed gravel should be used as infill for the gravel bags or continuous berm.
- This is a method that should be used in relatively calm water, and can be used in smaller streams.
- Prior to using this technique consider the following:
 - Do not use if the installation, maintenance and removal of the structures will disturb sensitive aquatic species of concern.

- Not appropriate for projects where dewatering is necessary.
- Not appropriate to completely dam streamflow.
- The following items should be considered when preparing project plans and specifications when this technique is used:
 - For the filter fabric isolation method, a non-woven or heavy-duty fabric (refer to Standard Specifications Section 96-1.02B) is recommended over standard silt fence. Using rolled geotextiles allows non-standard widths to be used.
 - Anchor filter fabric with gravel-filled bags filled with clean, washed gravel. Do not use sand. If a bag should split open, the gravel can be left in the stream if permitted under the project's 404 permit, where it can provide aquatic habitat benefits.
 - Another anchor alternative is a continuous berm, made with the Continuous Berm Machine. This is a gravel-filled bag that can be made in very long segments. The length of the berms is usually limited to 20 ft for ease of handling.
 - Place the fabric on the bottom of the stream, and place either a bag of clean, washed gravel or a continuous berm over the bottom of the fabric, such that a bag-width of fabric lies on the stream bottom. The bag should be placed on what will be the outside of the isolation area.
 - Pull the fabric up, and place a metal t-post immediately behind the fabric, on the inside of the isolation area; attach the fabric to the post with three diagonal nylon ties.
 - Continue placing fabric as described above until the entire work area has been isolated, staking the fabric at least every 6 ft.
 - During construction, inspect daily during the workweek.
 - Schedule additional inspections during storm events.
 - Immediately repair any gaps, holes or scour.
 - Remove sediment buildup.
 - Ensure pipe diversion is properly anchored to prevent shifting or leaking during use.
 - Remove BMP upon completion of construction activity. Recycle or re-use if applicable.

- Re-vegetate areas disturbed by BMP removal if needed.

Turbidity Curtain Isolation Technique

- A turbidity curtain is a fabric barrier used to isolate the near shore work area. The barriers are intended to confine the suspended sediment. The curtain is a floating barrier, and thus does not prevent water from entering the isolated area; rather, it prevents suspended sediment from getting out.
- Turbidity curtains should be used where sediment discharge to a stream is unavoidable. They are used when construction activities adjoin quiescent waters, such as lakes, ponds, lagoons, bays, and slow flowing rivers. The curtains are designed to deflect and contain sediment within a limited area and provide sufficient retention time so that the soil particles will fall out of suspension.
- Prior to using this technique consider the following:
 - Turbidity curtains should not be used in flowing water; they are best suited for use in quiescent ponds, lakes, lagoons, bays, and very slow-moving rivers.
 - Turbidity curtains should not be placed across the entire width of a channel.
 - Removing sediment that has been deflected and settled out by the curtain may create a discharge problem through the re-suspension of particles and by accidental dumping by the removal equipment.
 - Turbidity curtains may require a higher level of maintenance, adjustments, and relocation when deployed in comparison to structural isolation methods. However, turbidity curtains consist of flexible materials and may be repositioned and reconfigured as the limits of construction activity change.
- The following items should be considered when preparing project plans and specifications when this technique is used:
 - Turbidity curtains should be oriented parallel to the direction of flow wherever possible to avoid exerting excessive pressure on the fabric.
 - The curtain should extend the entire depth of the watercourse in calm-water situations.
 - In wave conditions, the curtain should extend to within 1 ft of the bottom of the watercourse, such that the curtain does not stir up sediment by hitting the bottom repeatedly. If it is desirable for the curtain to reach the bottom in an active-water situation, a pervious filter fabric may be used for the bottom 1 ft.

- The top of the curtain should consist of flexible flotation buoys, and the bottom shall be held down by a load line incorporated into the curtain fabric. The fabric shall be a brightly colored impervious mesh.
- The curtain shall be held in place by anchors placed at least every 100 ft, or as recommended by the manufacturer based on site-specific conditions, such as flow rate, wind speeds, currents, tidal influence, and wave action.
- First place the anchors, then tow the fabric out in a furled condition, and connect to the anchors. The anchors should be connected to the flotation devices, and not to the bottom of the curtain. Once in place, cut the furling lines, and allow the bottom of the curtain to sink. A second set of anchors may be required in tidally-influenced waters to secure the curtain against both the flood and ebb tides.
- Sediment that has been deflected and settled out by the curtain may be removed if so directed by the on-site inspector or the RE. Consideration must be given to the probable outcome of the removal procedure. It must be asked if it will create more of a sediment problem through re-suspension of the particles or by accidental dumping of material during removal. It is recommended that the soil particles trapped by the turbidity curtain only be removed if there has been a significant change in the original contours of the affected area in the watercourse.
- Particles should always be allowed to settle for a minimum of 6 to 12 hours prior to their removal or prior to removal of the turbidity curtain.
- The curtain should be inspected daily for holes or other problems, and any repairs needed should be made promptly.
- Allow sediment to settle for 6 to 12 hours prior to removal of sediment or curtain. This means that after removing sediment, wait an additional 6 to 12 hours before removing the curtain.
- To remove, install furling lines along the curtain, detach from anchors, and tow out of the water. Water quality monitoring is typically required before removing the turbidity curtain to verify that the entrained water, sediment, and other potential contaminants, such as sulfides, would not violate a water quality standard when released.

K-rail River Isolation

- This is temporary sediment control, or stream isolation method that uses K-rails to form the sediment deposition area, or to isolate the in-stream or near-bank construction area.
- Barriers are placed end-to-end in a pre-designed configuration and gravel-filled bags are used at the toe of the barrier and also at their abutting ends to seal and prevent movement of sediment beneath or through the barrier walls.

- The K-rail isolation can be used in streams with higher water velocities than many other isolation techniques.

Prior to using this technique consider the following:

- The K-rail method does not allow for full dewatering.
- The following items should be considered when preparing project plans and specifications when this technique is used:
 - To create a floor for the K-rail, move large rocks and obstructions. Place washed gravel and gravel-filled bags to create a level surface for K-rail to sit.
 - Place the bottom two K-rails adjacent to each other, and parallel to the direction of flow; fill the center portion with gravel bags. Then place the third K-rail on top of the bottom two; there should be sufficient gravel bags between the bottom K-rails such that the top one is supported by the gravel. Place plastic sheeting around the K-rails, and secure at the bottom with gravel bags.
 - Further support can be added by pinning and cabling the K-rails together. Also, large riprap and boulders can be used to support either side of the K-rail, especially where there is strong current.
 - The barrier should be inspected at least once daily, and any damage, movement or other problems should be addressed immediately.
 - Sediment should be allowed to settle for at least 6 to 12 hours prior to removal of sediment, and for 6 to 12 hours prior to removal of the barrier.

Stream Diversions

Stream diversions consist of a system of structures and measures that intercept an existing stream upstream of the project and, transports it around the work area, and discharges it downstream. The selection of which stream diversion technique to use depends upon the type of work involved, physical characteristics of the site, and the volume of water flowing through the project.

- Pumped diversions are appropriate in areas where de-watering is necessary.
- Dam-type diversions may serve as temporary access to the site.
- Where work areas require isolation from flows.

Prior to using this technique consider the following:

- Pumped diversions have limited flow capacity.

- Pumped diversion require frequent monitoring of pumps.
- Large flows during storm events can overtop dams.
- Flow diversion and re-direction with small dams involves in-stream disturbance and mobilization of sediment.
- The following items should be considered when preparing project plans and specifications when this technique is used:
 - Installation guidelines will vary based on existing site conditions and type of diversion used.
 - Diversions shall be sized to convey design flood flows.
 - Pump capacity must be sufficient for design flow; the upper limit is approximately 10 cfs (the capacity of two 8 inch pumps).
 - Adequate energy dissipation must be provided at the outlet to minimize erosion.
 - Dam materials used to create dams upstream and downstream of diversion should be erosion resistant; materials such as steel plate, sheetpile, sandbags, continuous berms, inflatable water bladders, etc. would be acceptable.
 - When constructing a diversion channel, begin excavation of the channel at the proposed downstream end, and work upstream. Once the watercourse to be diverted is reached, and the excavated channel is stable, breach the upstream end, and allow water to flow down the new channel. Once flow has been established in the diversion channel, install the diversion weir in the main channel; this will force all water to be diverted from the main channel.
 - Inspect diversion/encroachment structures before and after significant storms, and at least once per week while in service. Inspect daily during the construction.
 - Pumped diversions require frequent monitoring of pumps.
 - Inspect embankments and diversion channels before and after significant storms, and at least once per week while in service for damage to the linings, accumulating debris, sediment buildup, and adequacy of the slope protection. Remove debris and repair linings and slope protection as required. Repair holes, gaps, or scour.

- Upon completion of work, the diversion or isolation structure should be removed and flow should be re-directed through the new culvert or back into the original stream channel. Recycle or re-use if applicable.

SWPPP or WPCP ■ Clear Water Diversion must be discussed in Section 500.4 of the SWPPP or Section 30.3 of the WPCP.

Illegal Connection and Illicit Discharge Detection and Reporting

NS-6

Standard Symbol

BMP Objectives	
Soil Stabilization	<input type="checkbox"/>
Sediment Control	<input type="checkbox"/>
Tracking Control	<input type="checkbox"/>
Wind Erosion Control	<input type="checkbox"/>
Non-Stormwater Management	<input checked="" type="checkbox"/>
Materials and Waste Management	<input type="checkbox"/>

Definition and Purpose Procedures and practices designed for construction contractors to recognize illegal connections, illicit discharges or illegally dumped or discharged materials on a construction site and report incidents to the RE.

Appropriate Applications

- Illegal connection and Illicit discharge detection and reporting is applicable anytime an illegal connection or illicit discharge is discovered or illegally dumped material is found on the construction site.
- This BMP applies to all construction projects.

Limitations

- Illegal connection and Illicit discharge or dumping, for the purposes of this BMP, refer to discharges and dumping caused by parties other than the contractor.
- Procedures and practices presented in this BMP are general. Contractor shall use extreme caution, immediately notify the RE when illicit connections or illegal dumping or discharges are discovered, and take no further action unless directed by the RE.
- If pre-existing hazardous materials or wastes are known to exist onsite, the contractor's responsibility will be detailed in separate special provisions. Onsite area should be clearly marked and described in the SWPPP or WPCP.

Illegal Connection and Illicit Discharge Detection and Reporting

NS-6

Standards and Specifications **Inspection**

- Inspect site before beginning the job for evidence of Illegal connections or illicit dumping or discharges.

Illegal Connection and Illicit Discharge Detection and Reporting

- Solids - Look for debris or trash piles. Solid waste dumping often occurs on roadways with light traffic loads or in areas not easily visible from the traveled way.
- Liquids – signs of illegal liquid dumping or discharge can include:
 - Visible signs of staining or unusual colors to the pavement or surrounding adjacent soils.
 - Pungent odors coming from the drainage systems.
 - Discoloration or oily substances in the water or stains and residues detained within ditches, channels or drain boxes.
 - Abnormal water flow during the dry weather season.
- Urban Areas - Evidence of illegal connections or illicit discharges is typically detected at storm drain outfall locations or at manholes. Signs of an illegal connection or illicit discharge can include:
 - Abnormal water flow during the dry weather season.
 - Unusual flows in subdrain systems used for dewatering.
 - Pungent odors coming from the drainage systems.
 - Discoloration or oily substances in the water or stains and residues detained within ditches, channels or drain boxes.
 - Excessive sediment deposits, particularly adjacent to or near active off-site construction projects.
- Rural Areas - Illegal connections or illicit discharges involving irrigation drainage ditches are detected by visual inspections. Signs of an illicit discharge can include:
 - Abnormal water flow during the dry weather season.
 - Non-standard drainage junction structures.

Illegal Connection and Illicit Discharge Detection and Reporting

NS-6

- Broken concrete or other disturbances at or near junction structures.

Reporting

- Notify the RE of any illegal connections and illicit dumping or discharge incidents at the time of discovery. Do not take further action unless ordered.
 - The RE will notify the District Construction Stormwater Coordinator, who should coordinate with the NPDES Coordinator for reporting.
- Inspection, Cleanup and Removal
- Notify the RE of any illegal connections and illegal dumping or illicit discharge incidents at the time of discovery. Do not take further action unless ordered.
 - The contractor is not responsible for investigation and clean up of illegal connections or dumping or illicit discharges not generated by the contractor. Caltrans may direct the contractor to clean up non-hazardous dumped or discharged material on the construction site. Assume that unlabeled or unidentifiable material is hazardous.
 - Inspect the entire project site at least weekly to check for illegal connections or illicit discharges.
- SWPPP or WPCP
- Illegal Connection and Illicit Discharge Detection and Reporting must be discussed in Section 500.4.1 of the SWPPP or Section 30.3 of the WPCP.

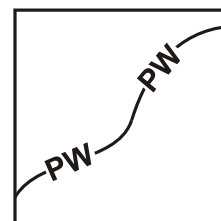

Illegal Connection and Illicit Discharge Detection and Reporting

Tracking Control	<input type="checkbox"/>
Wind Erosion Control	<input type="checkbox"/>
Non-Stormwater Management	<input checked="" type="checkbox"/>
Materials and Waste Management	<input type="checkbox"/>

- Definition and Purpose** Potable Water/Irrigation management consists of practices and procedures to manage the discharge of potential pollutants generated during discharges from irrigation water lines, landscape irrigation, lawn or garden watering, planned and unplanned discharges from potable water sources, water line flushing, and hydrant flushing.
- Appropriate Applications** Implement this BMP whenever the above activities or discharges occur at or enter a construction site.
- Limitations** ■ None identified.
- Standards and Specifications**
- Inspect irrigated areas within the construction limits for excess watering. Adjust watering times and schedules to ensure that the appropriate amount of water is being used and to minimize runoff. Consider factors such as soil structure, grade, relative compaction, time of year, and type of plant material in determining the proper amounts of water for a specific area.
 - Take precautions to prevent irrigation water from eroding soil, wetting vehicles and pavement, or otherwise causing sediment, hydrocarbons, and other non-visible pollutants that accumulate on those surfaces to discharge into a storm drain system or receiving waterbody.
 - When possible, discharges from water line flushing or temporary Active Treatment Systems (see Appendix C “Temporary Active Treatment System) should be reused for landscaping purposes.
 - Resident Engineer (RE) approval is required prior to commencing any washing activities that could discharge to the storm drain or receiving waterbody.

- Where possible, direct water from off-site sources around or through a construction site in a way that minimizes contact with the construction site.
 - Perform pressure tests on the irrigation system supply lines to test for leaks, which could result in erosion or runoff if breached.
 - Shut off the water source to broken lines, sprinklers, or valves as soon as possible to prevent excess water flow.
 - Protect downstream storm water drainage systems and receiving waters from water pumped or bailed from trenches excavated to repair water lines.
- Maintenance and Inspection
- Repair broken water lines as soon as possible or as directed by the RE.
 - Inspect irrigated areas regularly for signs of erosion and/or discharge.
- SWPPP or WPCP*
- Potable Water/Irrigation must be discussed in Section 500.4 of the SWPPP and/or Section 30.3 of the WPCP.

Tracking Control	<input type="checkbox"/>
Wind Erosion Control	<input type="checkbox"/>
Non-Stormwater Management	<input checked="" type="checkbox"/>
Materials and Waste Management	<input type="checkbox"/>

Definition and Purpose Vehicle and equipment cleaning procedures and practices are used to minimize or eliminate the discharge of pollutants from vehicle and equipment cleaning operations to storm drain systems or to watercourses.

Appropriate Applications These procedures are applied on all construction sites where vehicle and equipment cleaning is performed.

- Limitations**
- This BMP may be limited or disallowed under regulatory agency permits, particularly near Environmentally Sensitive Areas (ESAs).
 - Generates non-stormwater that requires management, and, in some cases, the disposal of hazardous waste.

Standards and Specifications ***General Requirements***

- Limit vehicle and equipment cleaning or washing at the job site except for the safety and protection of the equipment and as needed to comply with regulatory agency permits and approvals.
- Cleaning of vehicles and equipment with soap, solvents or steam shall not occur on the job site unless the RE has been notified in advance and the resulting wastes are fully contained in accordance with Standard Specifications Section 14-11 or 13-4.03D (5), whichever is applicable. Do not use diesel to clean vehicles and minimize the use of solvents.
- Vehicle and equipment wash water shall be contained for percolation or evaporative drying away from storm drain inlets or receiving waters and should not be discharged within the highway right-of-way. Apply other appropriate BMPs as applicable.

- All vehicles/equipment that regularly enter and leave the construction site must be cleaned off-site.
- Resulting wastes and by-products shall not be discharged or buried within the highway right-of-way, and must be captured and recycled or disposed according to the requirements of WM-10, “Liquid Waste Management” or WM-6, “Hazardous Waste Management,” depending on the waste characteristics.

Implementation

- When vehicle/equipment washing/cleaning must occur onsite, and the operation cannot be located within a structure or building equipped with appropriate disposal facilities, the outside cleaning area shall have the following characteristics, and shall be arranged with the WPC Manager, QSD, or QSP as well as the Construction Storm Water Coordinator:
 - Located away from storm drain inlets, drainage facilities, or watercourses.
 - Paved with concrete or asphalt and bermed to contain wash waters and to prevent run-on and runoff.
 - Configured with a sump to allow collection and disposal of wash water.
 - Wash waters shall not be discharged to storm drains or watercourses.
 - Used only when necessary.
- When cleaning vehicles/equipment with water:
 - Use as little water as possible. High pressure sprayers may use less water than a hose, and shall be considered.
 - Use positive shutoff valve to minimize water usage.
 - Facility wash racks shall discharge to a sanitary sewer, recycle system or other approved discharge system and shall not discharge to the storm drainage system or watercourses.

Maintenance and Inspection

- The control measure shall be inspected at least weekly, prior to a forecasted rain event, daily during extended rain events and post-storm events.
- Inspect wash area and sump regularly. Remove liquids and sediment as needed or as directed by the RE.

SWPPP or WPCP

- Vehicle Equipment Cleaning must be discussed in Section 500.4.2 of the SWPPP or Section 30.3 of the WPCP.

- Definition and Purpose** Vehicle and equipment fueling procedures and practices are designed to minimize or eliminate the discharge of fuel spills and leaks into storm drain systems or to receiving waters.
- Appropriate Applications** These procedures are applied on all construction sites where vehicle and equipment fueling takes place.
- Limitations**
- This BMP may be limited or disallowed under regulatory agency permits, particularly near Environmentally Sensitive Areas (ESAs).
 - Onsite vehicle and equipment fueling should only be used where it's impractical to send vehicles and equipment off-site for fueling.
- Standards and Specifications**
- When fueling must occur onsite, the contractor shall select and designate an area or areas to be used, subject to approval of the RE.
 - Dedicated fueling areas shall be protected from stormwater run-on and runoff, and shall be located at least 50 feet from downstream drainage facilities and watercourses. Fueling must be performed on level-grade areas.
 - Protect fueling areas with berms or dikes to prevent run-on, runoff, and to contain spills.
 - For long-term projects, consider constructing roofs or using portable tents over maintenance and fueling areas.
 - Absorbent spill clean-up materials and spill kits shall be available in fueling areas and on fueling trucks and used on small spills instead of hosing down or burying techniques. Affected absorbent material and spill kits should be removed promptly and disposed of properly after use.

- Drip pans or absorbent pads shall be readily available during vehicle and equipment fueling.
 - Vehicle and equipment fueling areas shall not be left unattended during fueling activities.
 - Nozzles used in vehicle and equipment fueling shall be equipped with an automatic shut-off to control drips.
 - Use vapor recovery nozzles to help control drips as well as air pollution where required by the Air Quality Management Districts.
 - Ensure the nozzle is secured upright when not in use.
 - Fuel tanks shall not be "topped-off."
 - Federal, state, and local requirements shall be observed for any stationary above ground storage tanks. Refer to WM-1, "Material Delivery and Storage" for specifics as to what needs to be included for BMP protection and documented in the SWPPP or WPCP.
 - Portable fuel canisters should be kept in a flammable cabinet when not in use.
- Maintenance and Inspection
- Vehicles and equipment shall be inspected on each day of use for leaks. Leaks shall be repaired immediately or problem vehicles or equipment shall be removed from the project site.
 - Fueling areas and storage tanks shall be inspected at least weekly, prior to a forecasted rain event, daily during extended rain events and post-storm events.
 - Immediately cleanup spills and properly dispose of contaminated soil and cleanup materials.
- SWPPP or WPCP
- Vehicle and Equipment Fueling must be discussed in Section 500.4.2 of the SWPPP or Section 30.3 of the WPCP.

Materials and Waste Management	<input type="checkbox"/>

Definition and Purpose

Procedures and practices to minimize or eliminate the discharge of pollutants to the storm drain systems or to receiving waters from vehicle and equipment maintenance activities.

Appropriate Applications

These procedures apply on all construction projects where an onsite uncovered yard area is necessary for storage and maintenance of heavy equipment and vehicles.

Limitations

- This BMP may be limited or disallowed under regulatory agency permits, particularly near Environmentally Sensitive Areas (ESAs).
- Onsite vehicle and equipment maintenance should only be used where it's impractical to send vehicles and equipment off-site for fueling.

Standards and Specifications

- When maintenance must occur onsite, the contractor shall select and designate an area to be used, subject to approval of the RE and implement appropriate controls for the activities to be performed.
- Dedicated maintenance areas shall be on level ground and protected from storm water run-on and runoff, and shall be located at least 50 ft from downstream drainage facilities and receiving waters.
- Protect maintenance areas with berms or dikes to prevent run-on, runoff, and to contain spills.
- For long-term projects, consider constructing roofs or using portable tents over maintenance areas.
- Absorbent spill clean-up materials and spill kits shall be available in maintenance areas and used on small spills instead of hosing down or burying techniques. Affected absorbent material and spill kits should be removed promptly and disposed of properly after use.

- Drip pans or absorbent pads shall be placed under vehicles and equipment when performing maintenance work that involves fluids. Vehicles and equipment maintenance areas shall not be left unattended during maintenance activities.
- Drip pans or plastic sheeting shall be placed under all vehicles and equipment placed on docks, barges, or other structures over water bodies when the vehicle or equipment is planned to be idle for more than one hour.
- Properly dispose or recycle used batteries and tires as well as any other vehicle or equipment parts.
- Substances used to coat asphalt transport trucks and asphalt-spreading equipment shall be non-toxic.
- Properly dispose of used oils, fluids, lubricants, and spill cleanup materials.
- Do not dump fuels and lubricants onto the ground.
- Do not place used oil in a dumpster or pour into a storm drain or watercourse.
- Do not bury used tires.
- Repair fluid and oil leaks immediately.
- Provide spill containment dikes or secondary containment around stored oil and chemical drums. Refer to WM-1, “Material Delivery and Storage” for details.

Maintenance and Inspection

- Vehicles and equipment shall be inspected on each day of use for leaks. Leaks shall be repaired immediately or removed from the project site.
- Maintenance areas and storage tanks shall be inspected regularly.
- Maintain waste fluid containers in leak proof condition.
- Inspect equipment for damaged hoses and leaky gaskets routinely. Repair or replace as needed.
- Inspection and Maintenance of these areas must be properly documented and the WPC Manager must ensure no potential for discharges occur from these areas as part of the non-visible monitoring requirements.

SWPPP or WPCP

- Vehicle and Equipment Maintenance must be discussed in Section 500.4 of the SWPPP or Section 30.3 of the WPCP.

Definition and Purpose The construction and retrofit of bridges and retaining walls often include driving piles for foundation support and shoring operations. Driven piles are typically constructed of concrete, steel, or timber. Driven sheet piles are used for shoring and cofferdam construction. Proper control and use of equipment, materials, and waste products from pile driving operations will reduce the discharge of potential pollutants to the storm drain system or receiving waters.

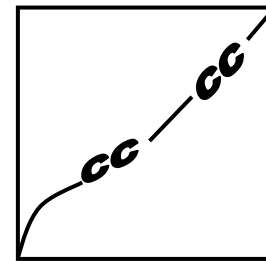

Appropriate Applications These procedures apply to construction sites near or adjacent to surface waters or groundwater where permanent and temporary pile driving operations (impact and vibratory) take place, including operations using pile shells for construction of cast-in-steel-shell and cast-in-drilled-hole piles.

Limitations None identified.

- Standards and Specifications**
- Have spill kits and cleanup materials available at all locations of pile driving. Refer to WM-4 “Spill Prevention and Control.”
 - Place drip pans, absorbent pads, or plastic sheeting with absorbent material under vehicles and equipment performing pile driving activities. Refer to NS-9 “Vehicle and Equipment Fueling” and NS-10 “Vehicle and Equipment Maintenance.”
 - Protect pile driving equipment, including hammers and other hydraulic attachments, by parking them on plywood and covering it with plastic sheeting when precipitation is forecasted.
 - When not in use, store pile driving equipment on level ground away from concentrated flows of storm water, drainage courses, and inlets.
 - Use less hazardous vegetable oil instead of hydraulic fluid, when practicable.

- Keep equipment that is in use in streambeds; or on docks, barges, or other structures over water bodies, leak free. The storage or use of equipment in streambeds or other bodies of water shall comply with all applicable regulatory permits. Refer to NS-13, “Material and Equipment Use Over Water.”
 - Implement other BMPs as applicable, such as NS-2 “Dewatering Operations,” WM-5 “Solid Waste Management,” WM-6 “Hazardous Waste Management,” and WM-10 “Liquid Waste Management.”
- Maintenance and Inspection
- Inspect pile driving areas and equipment for leaks and spills daily when they are in operation or within or next to water.
 - Inspect pile driving areas and equipment for leaks and spills at least weekly, prior to a forecasted rain event, daily during extended rain events and post-storm events.
 - Inspect equipment routinely and repair equipment as needed (e.g., worn or damaged hoses, fittings, gaskets).
 - Inspection and Maintenance of these areas must be properly documented and the WPC Manager must ensure no potential for discharges occur from these areas as part of the non-visible monitoring requirements.
- SWPPP or WPCP
- Pile Driving Operations must be discussed in Section 500.4 and 600.2¹ of the SWPPP or Section 30 of the WPCP.

¹Section 600.2 applies to the LTCGP SWPPP

Definition and Purpose

Concrete curing is used in the construction of structures such as bridges, retaining walls, and pump houses. Concrete curing includes the use of both chemical and water methods. Proper procedures to minimize any potential for runoff during concrete curing must take place.

Appropriate Applications

All concrete elements of a structure (e.g., footings, columns, abutments, stems, soffit, deck) are subject to curing requirements.

Limitations

None identified.

Standards and Specifications

Chemical Curing

- Avoid over-spray of curing compounds.
- Minimize the drift of chemical cure as much as possible by applying the curing compound close to the concrete surface. Apply an amount of compound that covers the surface, but does not allow any runoff of the compound.
- Use proper storage and handling techniques for concrete curing compounds. Refer to WM-1, “Material Delivery and Storage.”
- Protect drain inlets prior to the application of curing compounds. Refer to SC-10, “Temporary Drainage Inlet Protection.”
- Implement WM-4, “Spill Prevention and Control.”

Water Curing for Bridge Decks, Retaining Walls, and Other Structures

- Direct cure water away from inlets and receiving waters to collection areas for removal as approved by the RE and in accordance with all applicable permits.
 - Collect cure water and transport or dispose of water in accordance with all applicable permits
 - Utilize wet blankets or a similar method that maintains moisture while minimizing the use and possible discharge of water.
- Maintenance and Inspection
- Ensure that employees and subcontractors implement appropriate measures for storage, handling, and use of curing compounds.
 - Inspect any temporary diversion devices, lined channels, or swales for washouts, erosion, runoff or debris. Replace lining and remove debris as necessary.
 - Inspect cure containers and spraying equipment for leaks. Also, inspect concrete curing areas daily when there are ongoing operations.
 - The WPC Manager or QSP must ensure no concrete curing activities occur when rain is forecasted that could lead to a discharge.
- SWPPP or WPCP
- Concrete Curing must be discussed in Section 500.4 of the SWPPP or Section 30.3 of the WPCP.

Materials and Waste Management	<input checked="" type="checkbox"/>

- Definition and Purpose** Procedures for the proper use, storage, and disposal of materials and equipment on barges, boats, temporary construction pads, or similar locations that minimize or eliminate the discharge of potential pollutants into storm drain inlets or receiving waters.
- Appropriate Applications** These procedures shall be implemented for construction materials and wastes (solid and liquid) and any other materials that may be detrimental if released. Applies where materials and equipment are used on barges, boats, docks, and other platforms over or adjacent to a watercourse.
- Limitations** Specific requirements may be included in the contract documents and permit documents associated with regulatory agencies such as the Regional Water Quality Control Board (RWQCB), U.S. Army Corps of Engineers, and California Department of Fish and Wildlife.
- Standards and Specifications**
- Measures to prevent the discharge of potential pollutants into storm drain inlets or receiving waters while operating equipment or using materials over water are considered BMPs by the regulatory agencies and should be documented in the SWPPP.
 - Implement this BMP in accordance with all necessary permits required for construction within or near receiving waters, such as RWQCB, U.S. Army Corps of Engineers, Department of Fish and Wildlife and other local permitting agencies.

Material and Equipment Use Over Water

NS-13

- Place drip pans and absorbent materials under equipment and vehicles and ensure that an adequate supply of spill cleanup materials is onsite in accordance with a spill response plan, if applicable. Ensure that staff are trained regarding the deployment of the spill response plan.
 - Drip pans shall be placed under all vehicles and equipment placed on docks, barges, or other structures over water bodies when the vehicle or equipment is expected to be idle for more than one hour.
 - Install watertight curbs or toe boards to contain spills and prevent materials, tools, and debris from falling off the barge, platform, dock, etc.
 - Secure all materials to prevent discharges to receiving waters via wind.
 - Discharges to receiving waters shall be reported to the RE and the WPC Manager immediately upon discovery.
 - Maintain vehicles and equipment in accordance with NS-10, “Vehicle and Equipment Maintenance.” If a leaking line cannot be repaired, remove equipment from over the water and repair immediately.
 - Collect and contain demolished material in accordance with NS-15, “Structure Demolition/Removal Over or Adjacent to Water.”
 - Refer to WM-1, “Material Delivery and Storage” and WM-4, “Spill Prevention and Control.”
 - Ensure the timely and proper removal of accumulated wastes over water. Refer to WM-5, “Solid Waste Management” and WM-6, “Hazardous Waste Management.”
- Maintenance and Inspection
- Inspect vehicles and equipment for leaks and spills daily when they are in operation, make necessary repairs.
 - Ensure that employees and subcontractors implement appropriate measures for storage and use of materials and equipment.
 - Inspect and maintain all associated BMPs and perimeter controls to ensure continuous protection of the watercourse.
 - Inspect materials and equipment for leaks and spills at least weekly, prior to a forecasted rain event, daily during extended rain events and post-storm events.
 - Inspect equipment routinely and repair equipment as needed (e.g., worn or damaged hoses, fittings, gaskets).

Material and Equipment Use Over Water

NS-13

- Inspection and Maintenance of these areas must be properly documented and ensure no potential for discharges occur from these areas as part of the non-visible monitoring requirements.
- SWPPP or WPCP ■ Material and Equipment Use Over Water must be discussed in Section 500.4.1 of the SWPPP or Section 30.3.1 of the WPCP.

Definition and Purpose Concrete finishing methods are used for bridge deck rehabilitation, paint removal, curing compound removal, and final surface finish appearances. Methods include sand blasting, shot blasting, grinding, or high pressure water blasting. Proper procedures minimize the impact that concrete finishing methods may have on runoff.

Appropriate Applications These procedures apply to all construction locations where concrete finishing operations are performed.

Limitations Specific permit requirements may be included in the contract documents for certain concrete finishing operations.

Standards and Specifications **General Requirements**

- Follow containment requirements stated in the project special provisions.
- Collect and properly dispose of water and solid waste from high-pressure water blasting operations.
- Collect and properly dispose of water from water blasting operations, sand and solid waste from sandblasting operations.
- Protect drainage inlets within 50 feet of the sandblasting prior to beginning sandblasting operations. Refer to SC-10, “Temporary Drainage Inlet Protection.”
- Implement SC-7, “Street Sweeping” within the sand blasting and surrounding area.
- Minimize the drift of dust and blast material as much as possible by keeping the blasting nozzle close to the surface.

- Discharges to waterways shall be reported to the RE by the WPC Manager immediately upon discovery.

Other Considerations

- Direct water from blasting operations away from inlets and receiving waters to collection areas for removal (e.g., dewatering) as approved in advance by the RE and in accordance with applicable permits.
- When blast residue contains a potentially hazardous waste, refer to WM-6, “Hazardous Waste Management.”
- Implement WM-8, “Concrete Waste Management” in combination with this BMP.

Maintenance and Inspection

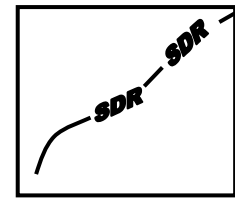

- At a minimum, inspect containment structures, if any, for damage or voids prior to use each day and prior to a likely forecasted rain event.
- At the end of each work shift, remove and contain the liquid and solid wastes from containment structures, if any, and from the general work area.
- Inspect concrete finishing areas at least weekly, prior to a forecasted rain event, daily during extended rain events and post-storm events.
- Inspection and Maintenance of these areas must be properly documented and ensure no potential for discharges occur from these areas as part of the non-visible monitoring requirements.

SWPPP or WPCP

- Concrete Finishing must be discussed in Section 500.4 of the SWPPP or Section 30.3.1 of the WPCP.

Materials and Waste Management	<input type="checkbox"/>

Definition and Purpose

Procedures to protect water bodies from debris and wastes associated with structure demolition or removal over or adjacent to receiving waters.

Appropriate Applications

- Full bridge demolition and removal projects.
- Partial bridge removal (e.g., barrier rail, edge of deck) associated with bridge widening projects.
- Projects that involve concrete channel removal.
- Any other project with structure removal that could potentially affect water quality.

Limitations

Specific requirements may be included in the contract documents and permit documents associated with regulatory agencies such as the Regional Water Quality Control Board, U.S. Army Corps of Engineers, and California Department of Fish and Wildlife.

Standards and Specifications

General Requirements

- A plan summarizing material containment, collection, and handling may be required to be submitted and fully implemented with the SWPPP.
- Do not allow demolished material to enter storm drain systems and receiving waters. Use covers and platforms authorized by the RE to collect debris.
- Collect and contain all demolished material within the containment system including process water and visible dust produced during demolition and cleaning operations daily. Handle debris according to Standard Specifications Section 13-4.03D.

Structure Demolition/Removal Over or Adjacent to Water

NS-15

- Implement in combination with NS-13, “Material and Equipment Use Over Water” and WM-04 “Spill Prevention and Control,” for handling of materials and equipment.
- Routinely sweep and vacuum work area to remove excess dust and debris in accordance with SC-07, “Street Sweeping.”
- Use inlet protection in accordance with SC-10, “Temporary Drainage Inlet Protection,” to protect storm drain inlets.
- Refer to NS-5, “Clear Water Diversion” to direct water away from work areas.
- Stockpile accumulated debris and waste generated during demolition away from drainage inlets and receiving waters and in accordance with WM-3, “Stockpile Management.”
- For structures containing hazardous materials (e.g., lead paint or asbestos) refer to WM-6, “Hazardous Waste Management.” For demolition work involving soil excavation around lead-painted structures, refer to WM-7, “Contaminated Soil Management.”
- Discharges to drainage inlets and receiving waters shall be reported to the RE and WPC Manager immediately upon discovery. A written discharge notification must follow.
- Keep adequate spill kit material onsite in accordance with a spill response plan, if applicable. Ensure that staff are trained regarding the deployment of the spill response plan.
- Ensure safe passage of wildlife, refer to Standard Specifications 83-3 Concrete Barriers.

Other Considerations

- Use attachments on construction equipment, such as backhoes and debris baskets, or barges to catch debris from demolition operations. Use plastic bibs to prevent hydraulic fuel leaks.
- Install perimeter controls and secondary containment to prevent leaks and spills from entering receiving waters. Perimeter controls and secondary containment may include sealed plywood and/or plastic sheeting, plastic liners and/or tarps, netting, silt fences, drip pans, containment booms and berms, and absorbent material.

Structure Demolition/Removal Over or Adjacent to Water

NS-15

- Maintenance and Inspection**
- Contractor must inspect demolition areas and containment systems over or adjacent to receiving waters daily when operations are ongoing.
 - Any debris-catching devices and containment systems shall be emptied daily. Collected debris shall be removed and stored away from the drainage inlets and receiving waters and protected from run-on and runoff.
 - Inspect demolition and containment systems over or adjacent to for leaks and spills at least weekly, prior to a forecasted rain event, daily during extended rain events and post-storm events.
 - Inspection and Maintenance of these areas must be properly documented and ensure no potential for discharges occur from these areas as part of the non-visible monitoring requirements.
- SWPPP or WPCP**
- Structure Demolition/Removal Over or Adjacent to Water must be discussed in Section 500.4.1 of the SWPPP or Section 30 of the WPCP

Structure Demolition/Removal Over or Adjacent to Water

NS-15

Section 8

Waste Management and Materials Pollution Control BMPs

8.1 Waste Management and Materials Pollution Control

Waste management and materials pollution control BMPs, like non-stormwater management BMPs, are source control BMPs that prevent pollution by limiting or reducing potential pollutants at their source before they come in contact with stormwater. These BMPs also involve day-to-day operations of the construction site and are under the control of the Contractor, and are additional “good housekeeping practices,” which involve keeping a clean, orderly construction site.

8.1.1 Waste Management BMPs

Waste management consists of implementing procedural and structural BMPs for handling, storing, and disposing of wastes generated by a construction project to prevent the release of waste materials into stormwater discharges.

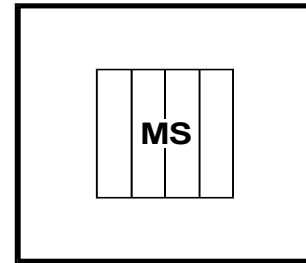

8.1.2 Materials Pollution Control BMPs

Materials pollution control (also called materials handling) consists of implementing procedural and structural BMPs for handling, storing, and using construction materials to prevent the release of those materials into stormwater discharges. The objective is to reduce the opportunity for rainfall to come in contact with these materials. These controls must be implemented for all applicable activities, material usage and site conditions.

Table 8-1 lists the waste management and materials pollution control BMPs.

Table 8-1. Waste Management and Materials Pollution Control BMPs	
ID	BMP Name
WM-1	Material Delivery and Storage
WM-2	Material Use
WM-3	Stockpile Management
WM-4	Spill Prevention and Control
WM-5	Solid Waste Management
WM-6	Hazardous Waste Management
WM-7	Contaminated Soil Management
WM-8	Concrete Waste Management
WM-9	Sanitary and Septic Waste Management
WM-10	Liquid Waste Management

The remainder of this section shows the working details for each of the waste management and materials pollution control BMPs.

Standard Symbol

BMP Objectives	
Soil Stabilization	<input type="checkbox"/>
Sediment Control	<input type="checkbox"/>
Tracking Control	<input type="checkbox"/>
Wind Erosion Control	<input type="checkbox"/>
Non-Stormwater Management	<input type="checkbox"/>
Materials and Waste Management	<input checked="" type="checkbox"/>

Definition and Purpose Procedures and practices for the proper handling and storage of materials in a manner that minimizes or eliminates the discharge of these materials to the storm drain system or to receiving waters.

Appropriate Applications These procedures are implemented at all construction sites with delivery and storage of the following:

- Hazardous chemicals such as:
 - Acids
 - lime
 - glues
 - adhesives
 - paints
 - solvents
 - curing compounds
- Soil stabilizers and binders
- Fertilizers
- Detergents
- Plaster
- Petroleum products such as fuel, oil, and grease

- Asphalt and concrete components
- Pesticides and herbicides
- Other materials that may be detrimental if released to the environment.

Limitations

- Space limitation may preclude indoor storage.
- Storage sheds must meet building & fire code requirements and be leak free.

Standards and Specifications

General

- Train employees and subcontractors on the proper material delivery and storage practices.
- Temporary storage area shall be located away from vehicular traffic.
- Safety Data Sheets (SDS) shall be supplied to the RE for all materials stored. Can be done at any time but at least 5 days prior to material being used or stored onsite.
- Must comply with Caltrans Standard Specification 13-4, “Job Site Management”, and 14-11, “Hazardous Waste and Contamination.”

Material Storage Areas and Practices

- Liquids, petroleum products, and substances listed in 40 CFR Parts 110, 117, or 302 shall be stored in approved containers and drums and shall be placed in temporary containment facilities for proper storage.
- Each temporary containment facility shall have a permanent cover and side wind protection or be covered during non-working days and whenever a storm event is forecasted.
- A temporary containment facility shall provide for a spill containment volume able to contain precipitation from a 24-hour, 25-year storm event, plus the greater of ten percent of the aggregate volume of all containers or 100 percent of the capacity of the largest container within its boundary, whichever is greater.
- A temporary containment facility shall be impervious to the materials stored therein for a minimum contact time of 72 hours.
- A temporary containment facility shall be maintained free of accumulated rainwater and spills. In the event of spills or leaks, accumulated rainwater and spills shall be collected and placed into drums. These liquids shall be handled as a hazardous waste unless testing determines them to be non-hazardous. All collected liquids or non-hazardous liquids shall be sent to an approved disposal site.

- Sufficient separation shall be provided between stored containers to allow for spill cleanup and emergency response access.
- Incompatible materials, such as chlorine and ammonia, shall not be stored in the same temporary containment facility.
- Materials shall be stored in their original containers and the original product labels shall be maintained in place in a legible condition. Damaged or otherwise illegible labels shall be replaced immediately.
- Bagged and boxed materials shall be stored on pallets and shall not be allowed to accumulate on the ground. To provide protection from wind and rain, bagged and boxed materials shall be covered during non-working days and prior to rain events.
- Stockpiles shall be protected in accordance with WM-3, “Stockpile Management.”
- Have proper storage instructions posted at all times in an open and conspicuous location and include it as an informal training component of the tailgates and ongoing WPC training.
- Do not store hazardous chemicals, drums, or bagged materials directly on the ground. Place these items on a pallet, under cover in secondary containment.
- Keep ample supply of appropriate spill clean up material near storage areas.
- Also, see WM-6, “Hazardous Waste Management,” for storing of hazardous materials.

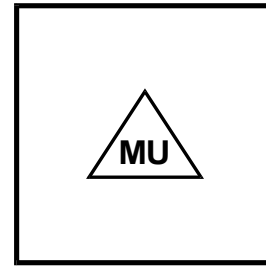

Material Delivery Practices

- Keep an accurate, up-to-date inventory of material delivered and stored on-site.
- Employees trained in emergency spill clean-up procedures shall be present when dangerous materials or liquid chemicals are unloaded.

Spill Clean-up

- Contain and clean up any spill immediately.
- If significant residual materials remain on the ground after construction is complete, properly remove and dispose any hazardous materials or contaminated soil.
- See WM-4, “Spill Prevention and Control,” for spills of chemicals and/or hazardous materials.

- Maintenance and Inspection
 - Storage areas shall be kept clean, well organized, and equipped with ample clean-up supplies as appropriate for the materials being stored.
 - Perimeter controls, containment structures, covers, and liners shall be repaired or replaced as needed to maintain proper function.
 - Inspect storage areas before, during and after rainfall events, and at least weekly during other times. Collect and place into drums any spills or accumulated rainwater and dispose of properly.
 - Material Delivery and Storage areas must be shown on the WPCDs and reflect current site conditions.
- SWPPP or WPCP
 - Material Delivery and Storage must be discussed in Section 500.4.2 of the SWPPP or Section 30.3.2 of the WPCP.

BMP Objectives	
Soil Stabilization	<input type="checkbox"/>
Sediment Control	<input type="checkbox"/>
Tracking Control	<input type="checkbox"/>
Wind Erosion Control	<input type="checkbox"/>
Non-Stormwater Management	<input type="checkbox"/>
Materials and Waste Management	<input checked="" type="checkbox"/>

Definition and Purpose These are procedures and practices for use of construction materials in a manner that minimizes or eliminates the discharge of these materials to the storm drain system or to receiving waters.

Appropriate Applications This BMP applies to all construction projects. These procedures apply when the following materials are used or prepared on site:

- Hazardous chemicals such as:
 - Acids
 - lime
 - glues
 - adhesives
 - paints
 - solvents
 - curing compounds
- Soil stabilizers and binders
- Fertilizers
- Detergents
- Plaster
- Petroleum products such as fuel, oil, and grease
- Asphalt and concrete components
- Pesticides and herbicides

- Limitations**

 - Other materials that may be detrimental if released to the environment
- Standards and Specifications**

 - Safer alternative building and construction products may not be available or suitable in every instance.
 - Safety Data Sheets (SDS) shall be supplied to the RE for all materials.
 - Latex paint and paint cans, used brushes, rags, absorbent materials, and drop cloths, when thoroughly dry and are no longer hazardous, may be disposed of with other construction debris.
 - Do not remove the original product label, it contains important safety and disposal information. Use the entire product before disposing of the container.
 - Mix paint indoors, or in a containment area. Never clean paintbrushes or rinse paint containers into a street, gutter, storm drain or near a water body. Dispose of any paint thinners, residue and sludge(s), that cannot be recycled, as hazardous waste.
 - For water-based paint, clean brushes to the extent practical, and rinse to a drain leading to a sanitary sewer where permitted, or into a concrete washout pit. For oil-based paints, clean brushes to the extent practical and filter and reuse thinners and solvents.
 - Use recycled and less hazardous products when practical. Recycle residual paints, solvents, non-treated lumber, and other materials.
 - Use materials only where and when needed to complete the construction activity. Use safer alternative materials as much as possible.
 - Do not over-apply fertilizers and pesticides. Prepare only the amount needed. Strictly follow the recommended usage instructions.
 - Application of herbicides and pesticides shall be performed by a licensed applicator. Document the location, chemicals applied, applicants name and qualifications.
 - Contractors are required to complete the “Report of Chemical Spray Forms” when spraying herbicides and pesticides.
 - Keep an ample supply of spill clean up material near use areas. Train employees in spill clean up procedures.
 - Avoid exposing applied materials to rainfall and runoff unless sufficient time has been allowed for them to dry.
- Maintenance and Inspections**

 - Inspect storage areas before, during and after rainfall events, and at least weekly during other times. Collect and place into drums any spills or accumulated rainwater and dispose of properly.
 - Spot check employees and subcontractors throughout the job, include appropriate practices as part of the informal tailgate training.
- SWPPP or WPCP**

 - Material Use must be discussed in Section 500.4 of the SWPPP or Section 30.3 of the WPCP.

Standard Symbol

BMP Objectives	
Soil Stabilization	<input type="checkbox"/>
Sediment Control	<input type="checkbox"/>
Tracking Control	<input type="checkbox"/>
Wind Erosion Control	<input type="checkbox"/>
Non-Stormwater Management	<input type="checkbox"/>
Materials and Waste Management	<input checked="" type="checkbox"/>

Definition and Purpose	Stockpile management procedures and practices are designed to reduce or eliminate air and storm water pollution from stockpiles of soil, and paving materials such as portland cement concrete (PCC) rubble, asphalt concrete (AC), asphalt concrete rubble, aggregate base, aggregate subbase or pre-mixed aggregate, asphalt binder (so called “cold mix” asphalt) and pressure treated wood.
Appropriate Applications	Implemented in all projects that stockpile soil and other materials.
Limitations	Use of plastic cover might be restricted depending on the location of the site and regulatory permits.
Standards and Specifications	<ul style="list-style-type: none"> ■ Stockpiles must comply with Standard Specification 13-4.03C (3) Stockpile Management. ■ Protection of stockpiles is a year-round requirement. ■ Locate stockpiles a minimum of 50 ft. away from concentrated flows of storm water, drainage courses, and inlets. ■ Utilize run-on and run-off BMPs to ensure stockpile materials are protected and do not have the potential to discharge material. ■ Implement wind erosion control practices as appropriate on all stockpiled material. For specific information see WE-1, “Wind Erosion Control.” ■ Stockpiles of contaminated soil shall be managed in accordance with WM-7, “Contaminated Soil Management.” ■ Bagged materials should be placed on pallets and under cover.

Protection of Inactive Stockpiles

Inactive stockpiles of the identified materials shall be protected further as follows:

- Soil stockpiles:
 - soil stockpiles shall be covered or protected with soil stabilization measures and a temporary perimeter sediment barrier at all times. If no longer needed, they should be removed and disposed of properly.
- Stockpiles of portland cement concrete rubble, asphalt concrete, asphalt concrete rubble, aggregate base, or aggregate subbase:
 - the stockpiles shall be covered or protected with a temporary perimeter sediment barrier at all times. If no longer needed, they should be removed and disposed of properly.
- Stockpiles of “cold mix”:
 - Cold mix stockpiles shall be placed on and covered with plastic or comparable material at all times and surround by a berm.
- Stockpiles/Storage of pressure treated wood with copper, chromium, and arsenic or ammonical, copper, zinc, and arsenate:
 - Treated wood shall be covered with plastic or comparable material and placed on pallets.

Protection of Active Stockpiles

Active stockpiles shall be protected further as follows:

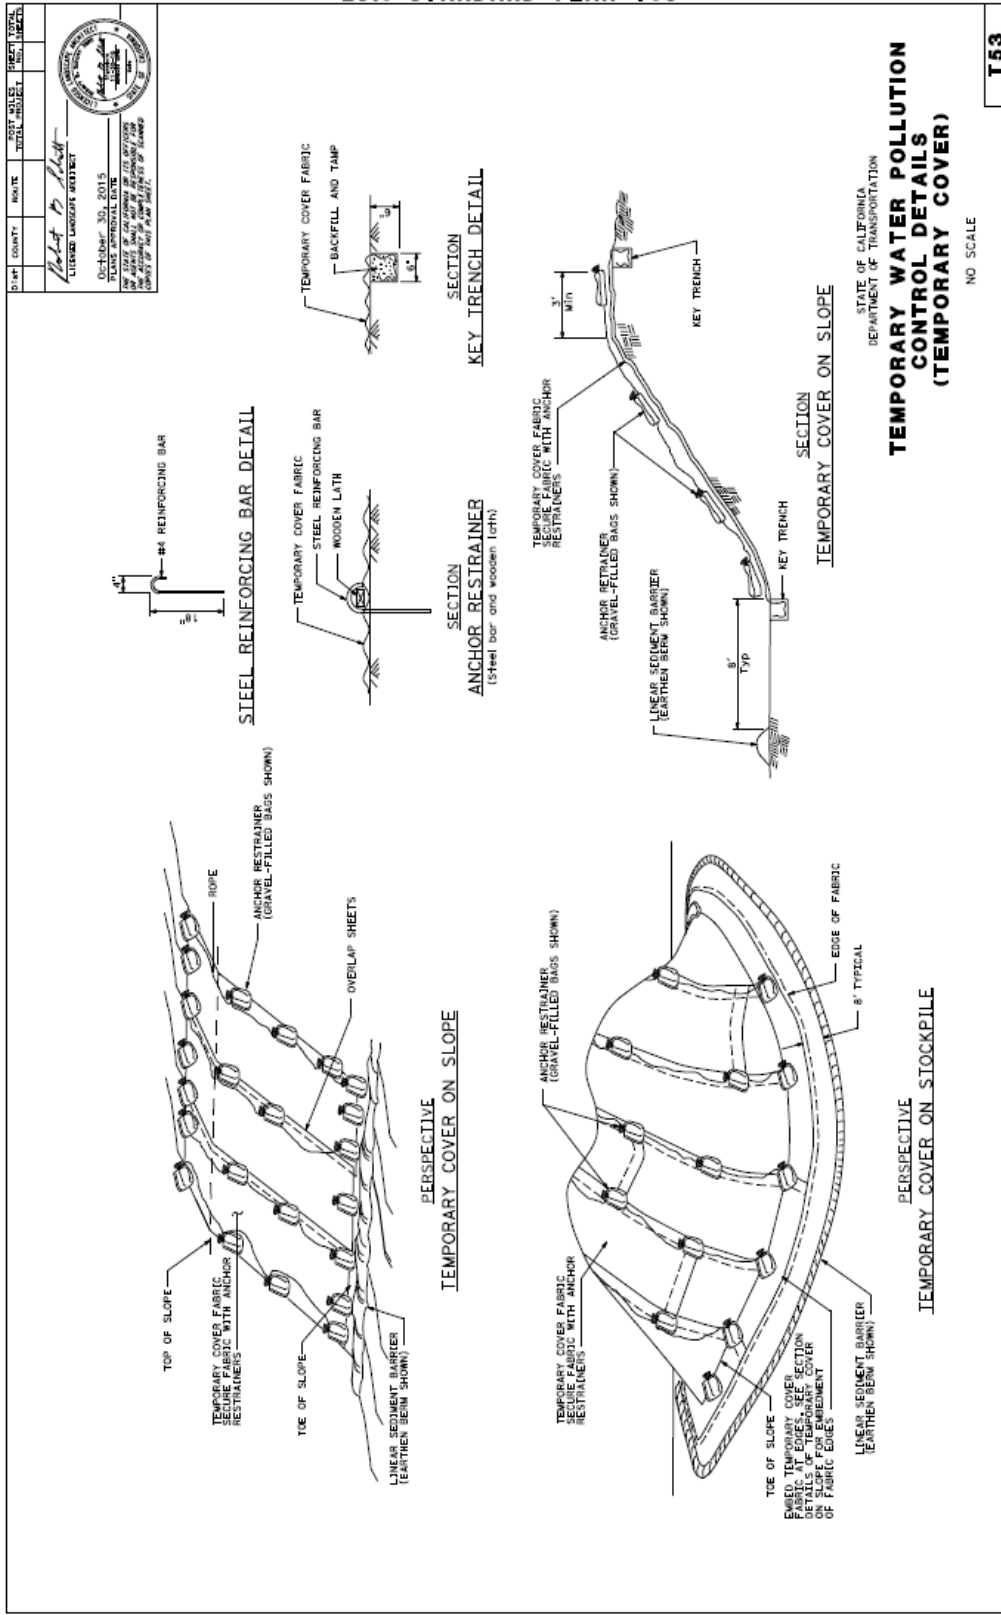

- All stockpiles shall be covered, stabilized, or protected with a temporary linear sediment barrier prior to the onset of precipitation.
- Stockpiles of “cold mix” shall be placed on and covered with plastic or comparable material prior to the onset of precipitation.
- All Stockpiles should be removed from the site and disposed of properly.

Maintenance and Inspections

- Inspect Stockpile Management areas before, during and after rainfall events, and at least weekly during other times.
- Repair and/or replace perimeter controls and covers to keep Stockpile Management functioning properly.
- Stockpile Management areas must be shown on the WPCDs and reflect site conditions.

SWPPP or WPCP

- Stockpile Management must be discussed in Section 500.4.2 of the SWPPP or Section 30.3.2 of the WPCP.

Stockpile Management

WM-3

Standard Symbol

BMP Objectives	
Soil Stabilization	<input type="checkbox"/>
Sediment Control	<input type="checkbox"/>
Tracking Control	<input type="checkbox"/>
Wind Erosion Control	<input type="checkbox"/>
Non-Stormwater Management	<input type="checkbox"/>
Materials and Waste Management	<input checked="" type="checkbox"/>

Definition and Purpose These procedures and practices are implemented to prevent and control spills in a manner that minimizes or prevents the discharge of spilled material to the drainage system or watercourses.

Appropriate Application This best management practice (BMP) applies to all construction projects. Spill control procedures are implemented anytime chemicals and/or hazardous substances are stored. Substances may include, but are not limited to:

- Soil stabilizers/binders.
 - Dust Palliatives.
 - Herbicides.
 - Growth inhibitors.
 - Fertilizers.
 - Deicing/anti-icing chemicals.
 - Fuels.
 - Lubricants.
 - Other petroleum distillates.
- To the extent that the work can be accomplished safely, spills of oil, petroleum products, substances listed under 40 CFR parts 110, 117, and 302, and sanitary and septic wastes shall be contained and cleaned up immediately.

- Limitations**
- This BMP only applies to spills caused by the contractor. Other spills or discharges observed or discovered must be reported to the RE.
 - Procedures and practices presented in this BMP are general. Contractor shall identify appropriate practices for the specific materials used or stored on-site and follow the appropriate Safety Data Sheets (SDS).

- Standards and Specifications**
- Must comply with Caltrans Standard Specifications 13-4.03B Spill Prevention and Control.
 - To the extent that it doesn't compromise clean up activities, spills shall be covered and protected from stormwater run-on.
 - Spills shall not be buried or washed with water. Potable water has chlorine and therefore should not be allowed to be discharged off the project site.
 - Used clean up materials, contaminated materials, and recovered spill material that is no longer suitable for the intended purpose shall be stored and properly disposed of.
 - Water used for cleaning and decontamination shall not be allowed to enter storm drains or watercourses and shall be collected and disposed of in accordance with WM-10, "Liquid Waste Management."
 - Water overflow or minor water spillage shall be contained and shall not be allowed to discharge into drainage facilities or watercourses.
 - Proper storage, clean-up and spill reporting instruction for hazardous materials stored or used on the project site shall be posted at all times in an open, conspicuous and accessible location.
 - Waste storage areas shall be kept clean, well organized and equipped with ample clean-up supplies as appropriate for the materials being stored. Perimeter controls, containment structures, covers and liners shall be repaired or replaced as needed to maintain proper function.

Education

- Educate employees and subcontractors on what a "significant spill" is for each material they use, and what is the appropriate response for "significant" and "insignificant" spills.
- Educate employees and subcontractors on potential dangers to humans and the environment from spills and leaks.
- Hold regular meetings to discuss and reinforce appropriate disposal procedures (incorporate into regular safety meetings).
- Establish a continuing education program to indoctrinate new employees.

- The WPC Manager shall oversee and enforce proper spill prevention and control measures.
- The list of reportable quantities can be found at <https://www.bnl.gov/esh/env/compliance/docs/SaraTitleList.pdf>.

Cleanup and Storage Procedures

- Minor Spills:
 - Minor spills typically involve small quantities of oil, gasoline, paint, etc., which can be controlled by the first responder at the discovery of the spill.
 - Use absorbent materials on small spills rather than hosing down or burying the spill.
 - Remove the absorbent materials promptly and dispose of properly.
 - The practice commonly followed for a minor spill is:
 - Contain the spread of the spill.
 - Recover spilled materials.
 - Clean the area and/or properly dispose of contaminated materials.
- Semi-Significant Spills:
 - Semi-significant spills still can be controlled by the first responder along with the aid of other personnel such as laborers and the foreman, etc. This response may require the cessation of all other activities.
- Clean-up spills immediately:
 - Notify the WPC Manager immediately. The WPC Manager shall notify the RE and prepare the proper notifications as required.
- Contain spread of the spill.
 - If the spill occurs on paved or impermeable surfaces, clean up using "dry" methods (absorbent materials, cat litter and/or rags). Contain the spill by encircling with absorbent materials.
 - If the spill occurs in dirt areas, immediately contain the spill. Dig up and properly dispose of contaminated soil.
 - If the spill occurs during rain, cover spill with tarps to prevent contaminating runoff.

- Significant/Hazardous Spills:

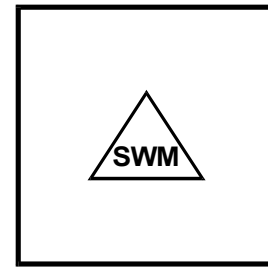

- For significant or hazardous spills that cannot be controlled by personnel in the immediate vicinity, the following steps shall be taken:
 - Notify the RE immediately and follow up with a written report.
 - Notify the local emergency response by dialing 911. In addition to 911, the contractor will notify the proper county officials. It is the contractor's responsibility to have all emergency phone numbers at the construction site.
 - Notify the Governor's Office of Emergency Services Warning Center, (800) 852-7550 or 1-916-845-8911.
 - For spills of federal reportable quantities, in conformance with the requirements in 40 CFR parts 110,119, and 302, the contractor shall notify the National Response Center at (800) 424-8802.
 - Notification shall first be made by telephone and followed up with a written report. The reporting form is located at <http://www.caloes.ca.gov/FireRescueSite/Documents/304%20-%20Written%20Report%20Form.pdf>.
 - The services of a spills contractor or a Haz-Mat team shall be obtained immediately. Construction personnel shall not attempt to clean up the spill until the appropriate and qualified staff have arrived at the job site.
 - Other agencies which may need to be consulted include, but are not limited to, the Fire Department, the Public Works Department, the Coast Guard, the Highway Patrol, the City/County Police Department, Department of Toxic Substances, California Division of Oil and Gas, Cal/OSHA, RWQCB, etc.

Maintenance and Inspection

- Verify weekly that spill control clean-up materials are located near material storage, unloading, and use areas.
- Update spill prevention and control plans and stock appropriate clean-up materials when changes occur in the types of chemicals used or stored onsite.
- Improper clean-up might trigger need for water quality or soil testing. The WPC Manager should be proactive in ensuring controls are in place and adequate to contain and prevent further issues.

SWPPP or WPCP

- Spill Prevention and Control must be discussed in Section 500.4 of the SWPPP or Section 30.3.2 of the WPCP.

Standard Symbol

BMP Objectives	
Soil Stabilization	<input type="checkbox"/>
Sediment Control	<input type="checkbox"/>
Tracking Control	<input type="checkbox"/>
Wind Erosion Control	<input type="checkbox"/>
Non-Stormwater Management	<input type="checkbox"/>
Materials and Waste Management	<input checked="" type="checkbox"/>

Definition and Purpose Solid waste management procedures and practices are designed to minimize or eliminate the discharge of pollutants to the drainage system or to water bodies as a result of the creation, stockpiling, or removal of construction site wastes.

Appropriate Applications Solid waste management procedures and practices are implemented on all construction projects that generate solid wastes.

Solid wastes include but are not limited to:

- Construction wastes including brick, mortar, timber, steel and metal scraps, sawdust, pipe and electrical cuttings, non-hazardous equipment parts, styrofoam and other materials used to transport and package construction materials.
- Highway planting wastes, including vegetative material, plant containers, and packaging materials.
- Litter, including food containers, beverage cans, coffee cups, paper bags, plastic wrappers, and smoking materials, including litter generated by the public.

Limitations None identified.

Standards and Specifications **Education**

- The WPC Manager shall oversee and enforce proper solid waste procedures and practices.

- Instruct employees and subcontractors on identification of solid waste and hazardous waste.
- Educate employees and subcontractors on solid waste storage and disposal procedures.
- Hold regular meetings to discuss and reinforce disposal procedures (incorporate into regular safety meetings and tailgate sessions).
- Require that employees and subcontractors follow solid waste handling and storage procedures.
- Prohibit littering by employees, subcontractors, and visitors.
- Wherever possible, minimize production of solid waste materials.
- Must comply with Standard specification 14-10 Solid Waste Disposal and Recycling and 13-4 Job Site Handling.

Collection, Storage, and Disposal

- Dumpsters of sufficient size and number shall be provided to contain the solid waste generated by the project and be properly serviced. Must ensure that containers are watertight and have a cover.
- Littering on the project site shall be prohibited.
- To prevent clogging of the storm drainage system, litter and debris removal from drainage grates, trash racks, and ditch lines shall be a priority.
- Trash receptacles shall be provided in the Contractor's yard, field trailer areas, and at locations where workers congregate for lunch and break periods.
- Construction debris and litter from work areas within the construction limits of the project site shall be collected and placed in watertight dumpsters at least weekly regardless of whether the litter was generated by the Contractor, the public, or others. Collected litter and debris shall not be placed in or next to drain inlets, storm water drainage systems or watercourses.
- Full dumpsters shall be removed from the project site and the contents shall be disposed of outside the highway right-of-way in conformance with the provisions in the Standard Specifications Section 14-10 Solid Waste Disposal and Recycling.
- Litter stored in collection areas and containers shall be handled and disposed of by trash hauling contractors.
- Construction material visible to the public shall be stored or stacked in an orderly manner to the satisfaction of the RE.

- Stormwater run-on shall be prevented from contacting stored solid waste by berms, dikes, or other temporary diversion structures or through the use of measures to elevate waste from site surfaces.
 - Solid waste storage areas shall be located at least 50 ft. from drainage facilities and watercourses and shall not be located in areas prone to flooding or ponding.
 - Except during fair weather, construction and highway planting waste not stored in watertight dumpsters shall be securely covered from wind and rain by covering the waste with tarps or plastic sheeting.
 - Dumpster washout on the project site is not allowed.
 - Notify trash hauling contractors that only watertight dumpsters are acceptable for use on-site.
 - Plan for additional containers during the demolition phase of construction.
 - Plan for more frequent pickup during the demolition phase of construction.
 - Construction waste shall be stored in a designated area and shown in the WPCDs.
 - Segregate potentially hazardous waste from non-hazardous construction site waste.
 - Keep the site clean of litter debris.
 - Make sure that toxic liquid wastes (e.g., used oils, solvents, and paints) and chemicals (e.g., acids, pesticides, additives, curing compounds) are not disposed of in dumpsters designated for construction debris.
 - Dispose of non-hazardous waste in accordance with Standard Specification 14-10 Solid Waste Disposal and Recycling.
 - For disposal of hazardous waste, see BMP WM-6, “Hazardous Waste Management.” Have hazardous waste hauled to an appropriate disposal and/or recycling facility.
 - Salvage or recycle useful vegetation debris, packaging and/or surplus building materials when practical. For example, trees and shrubs from land clearing can be converted into wood chips, then used as mulch on graded areas. Wood pallets, cardboard boxes, and construction scraps can also be recycled.
- Maintenance and Inspection ■ The WPC Manager shall monitor onsite solid waste storage and disposal procedures.

- Specific locations for Solid Waste Storage or Containment must be shown in the WPCDs and must be inspected and maintained regularly.
- SWPPP or WPCP
- Solid Waste Management must be discussed in Section 500.4 of the SWPPP or Section 30.3.2 of the WPCP.

Standard Symbol

BMP Objectives	
Soil Stabilization	<input type="checkbox"/>
Sediment Control	<input type="checkbox"/>
Tracking Control	<input type="checkbox"/>
Wind Erosion Control	<input type="checkbox"/>
Non-Stormwater Management	<input type="checkbox"/>
Materials and Waste Management	<input checked="" type="checkbox"/>

Definition and Purpose These are procedures and practices to minimize or eliminate the discharge of pollutants from construction site hazardous waste to the storm drain systems or to watercourses.

- Appropriate Applications**
- This best management practice (BMP) applies to all construction projects.
 - Hazardous waste management practices are implemented on construction projects that generate waste from the use of:
 - Petroleum Products
 - Asphalt Products
 - Concrete Curing Compounds
 - Pesticides
 - Palliatives
 - Acids
 - Paints
 - Stains
 - Solvents
 - Septic Wastes
 - Wood Preservatives

- Roofing Tar, or
- Any materials deemed a hazardous waste in California, Title 22 Division 4.5, or listed in 40 CFR Parts 110, 117, 261, or 302.

- Limitations**
- Nothing in this BMP relieves the Contractor from responsibility for compliance with federal, state, and local laws regarding storage, handling, transportation, and disposal of hazardous wastes.
 - This BMP does not cover aerially deposited lead (ADL) soils. For ADL soils refer to WM-7, “Contaminated Soil Management,” and the project special provisions.

Standards and Specifications

Education

- Educate employees and subcontractors on hazardous waste storage and disposal procedures.
- Educate employees and subcontractors on potential dangers to humans and the environment from hazardous wastes.
- Instruct employees and subcontractors on safety procedures for common construction site hazardous wastes.
- Instruct employees and subcontractors in identification of hazardous and solid waste.
- Hold regular meetings to discuss and reinforce hazardous waste management procedures (incorporate into regular safety meetings and tailgate sessions).
- The WPC Manager must oversee and enforce proper hazardous waste management procedures and practices.
- Make sure that hazardous waste is collected, removed, and disposed of only at authorized disposal areas.

Storage Procedures

- Wastes shall be stored in sealed containers constructed of a suitable material and shall be labeled as required by Title 22 CCR, Division 4.5 and 49 CFR Parts 172,173, 177 and 178, 179.
- All hazardous waste shall be stored, transported, and disposed as required in Title 22 CCR, Division 4.5 and 49 CFR 261-263.

- Waste containers shall be stored in temporary containment facilities that shall comply with the following requirements:
 - Temporary containment facility shall provide for a spill containment volume able to contain precipitation from a 24-hour, 25-year storm event, plus the greater of ten percent of the aggregate volume of all containers or 100 percent of the capacity of the largest tank within its boundary, whichever is greater.
 - Temporary containment facility shall be impervious to the materials stored there for a minimum contact time of 72 hours.
 - Temporary containment facilities shall be maintained free of accumulated rainwater and spills. In the event of spills or leaks accumulated rainwater and spills shall be placed into drums after each rainfall. These liquids shall be handled as a hazardous waste unless testing determines them to be non-hazardous. Non-hazardous liquids shall be sent to an approved disposal site.
 - Sufficient separation shall be provided between stored containers to allow for spill cleanup and emergency response access.
 - Incompatible materials, such as chlorine and ammonia, shall not be stored in the same temporary containment facility.
 - Temporary containment facilities shall be covered during non-working days, and prior to rain events. Covered facilities may include use of plastic tarps for small facilities or constructed roofs with overhangs. A storage facility having a solid cover and sides is preferred to a temporary tarp. Storage facilities shall be equipped with adequate ventilation.
- Drums shall not be overfilled and wastes shall not be mixed.
- Unless watertight, containers of dry waste shall be stored on pallets.
- Paint brushes and equipment for water and oil based paints shall be cleaned within a contained area and shall not be allowed to contaminate site soils, watercourses or drainage systems. Waste paints, thinners, solvents, residues, and sludges that cannot be recycled or reused shall be disposed of as hazardous waste. When thoroughly dry, latex paint and paint cans, used brushes, rags, absorbent materials, and drop cloths shall be disposed of as solid waste.
- Ensure that adequate hazardous waste storage volume is available.
- Ensure that hazardous waste collection containers are conveniently located.

- Designate hazardous waste storage areas on site away from storm drains or watercourses and away from moving vehicles and equipment to prevent accidental spills.
- Minimize production or generation of hazardous materials and hazardous waste on the job site.
- Use containment berms in fueling and maintenance areas and where the potential for spills is high.
- Segregate potentially hazardous waste from non-hazardous construction site debris.
- Keep liquid or semi-liquid hazardous waste in appropriate containers (closed drums or similar) and under cover.
- Clearly label all hazardous waste containers with the waste being stored and the date of accumulation.
- Place hazardous waste containers in secondary containment.
- Do not allow potentially hazardous waste materials to accumulate on the ground.
- Do not mix wastes.

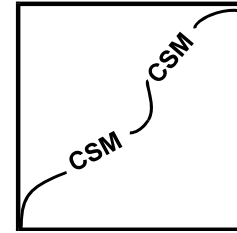

Disposal Procedures

- Waste shall be disposed of outside the highway right-of-way within 90 days of being generated, or as directed by the RE. In no case, shall hazardous waste storage exceed requirements in Title 22 CCR, Section 66262.34.
- Waste shall be disposed of by a licensed hazardous waste transporter at an authorized and licensed disposal facility or recycling facility utilizing properly completed Uniform Hazardous Waste Manifest forms.
- An ELAP accredited laboratory shall sample waste and analyze it to determine the appropriate disposal facility.
- Make sure that toxic liquid wastes (e.g., used oils, solvents, and paints) and chemicals (e.g., acids, pesticides, additives, curing compounds) are not disposed of in dumpsters designated for solid waste construction debris.
- Properly dispose of rainwater in secondary containment that may have mixed with hazardous waste.
- Recycle any useful material such as used oil or water-based paint when practical.

- Attention is directed to "Hazardous Material", "Contaminated Material", and "Aerially Deposited Lead" of the contract documents regarding the handling and disposal of hazardous materials.
- Maintenance and Inspection
- The WPC Manager or QSP shall monitor on-site hazardous waste storage and disposal procedures.
 - Waste storage areas shall be kept clean, well-organized, and equipped with ample clean-up supplies as appropriate for the materials being stored.
 - Storage areas shall be inspected in conformance with the provisions in the contract documents. At a minimum, storage areas must be inspected before, daily during extended storm event, after every storm event and weekly year-round. Perimeter controls, containment structures, covers, and liners shall be repaired or replaced as needed to maintain proper function.
 - Hazardous spills shall be cleaned up and reported in conformance with the applicable Safety Data Sheet (SDS) and the instructions posted at the project site.
 - The National Response Center, at (800) 424-8802, shall be notified of spills of Federal reportable quantities in conformance with the requirements in 40 CFR parts 110, 117, and 302.
 - Copy of the hazardous waste manifests shall be provided to the RE.
- SWPPP or WPCP
- Hazardous Waste Management must be discussed in Section 500.4 of the SWPPP or Section 30.3 of the WPCP.

BMP Objectives	
Soil Stabilization	<input type="checkbox"/>
Sediment Control	<input type="checkbox"/>
Tracking Control	<input type="checkbox"/>
Wind Erosion Control	<input type="checkbox"/>
Non-Stormwater Management	<input type="checkbox"/>
Materials and Waste Management	<input checked="" type="checkbox"/>

- Definition and Purpose** These are procedures and practices to minimize or eliminate the discharges of pollutants to the drainage system or to receiving waters from contaminated soil.
- Appropriate Applications**
- Contaminated soil management is implemented on construction projects where soil contamination may have occurred due to spills, illicit discharges, and leaks from underground storage tanks.
 - It may also apply to highway widening projects in older areas where median and shoulder soils may have been contaminated by aerially deposited lead (ADL).
- Limitations** The procedures and practices presented in this best management practice (BMP) are general. The contractor shall identify appropriate practices and procedures consistent with the plans and specifications for the specific contaminants known to exist or discovered on site.
- Standards and Specifications** ***Identifying Contaminated Areas***
- Contaminated soils are often identified during project planning and development with known locations identified in the plans and specifications. The contractor shall review applicable reports and examine applicable call-outs in the plans and specifications.
 - The contractor may discover contaminated soils not identified in the plans and specifications by observing:
 - Spills and leaks, discoloration, odors or abandoned underground tanks or pipes.

- Spills and leaks caused by the contractor are the contractor's responsibility for removal, testing, and disposal.

If unanticipated asbestos or hazardous substances are discovered, that were not released by the contractor, the contractor shall stop work in that area and immediately notify the RE. The contractor shall not resume work in the area until directed to do so.

Education

- Prior to performing any excavation work at the locations containing material classified as hazardous, employees and subcontractors shall complete a safety training program which meets 29 CFR 1910.120 and 8 CCR 5192 covering the potential hazards as identified.
- Educate employees and subcontractors in identification of contaminated soil and on contaminated soil handling, containment and disposal procedures.
- Hold regular meetings to discuss and reinforce contaminated soil handling, containment and disposal procedures (incorporate into regular safety meetings and tailgates).

Handling Procedures for Material with Aerially Deposited Lead (ADL)

- Materials from areas designated as containing (ADL) may, if allowed by the contract special provisions, be excavated, transported, and used in the construction of embankments and/or backfill.
- Must comply with Standard specification requirements outlined in Section 14-11 Hazardous Waste and Contamination.
- Must comply with the DTSC ADL agreement for specific requirements regarding handling, stockpiling and hauling of material.
- Excavation, transportation, and placement operations shall result in no visible dust.
- Use caution to prevent spillage of lead containing material during transport.
- Monitor the air quality during excavation of soils contaminated with lead.

Handling Procedures for Contaminated Soils

- Contaminated soil shall be disposed of properly in compliance with the specifications and all applicable regulations. in Title 22, CCR, Division 4.5 and section 14-11 of the specifications.
- If required by the specifications test contaminated soils at a SWRCB ELAP certified laboratory.

- If the soil is contaminated, work with the local regulatory agencies to develop options for treatment and/or disposal.
- Avoid temporary stockpiling of contaminated soils or hazardous material.
- If temporary stockpiling is allowed by the specifications.
- Place plastic sheeting or tarps underneath material and cover the stockpile with plastic sheeting or tarps if required by the specifications.
- Install a berm around the stockpile to prevent run-on or run-off from leaving the area.
- Do not stockpile in or near storm drains or receiving water.
- Install berms or run-on controls to prevent stormwater from commingling with contaminated areas.
- Contaminated material and hazardous material on exteriors of transport vehicles shall be removed and placed either into the current transport vehicle or the excavation prior to the vehicle leaving the exclusion zone.
- Monitor the air quality during excavation operations if required.
- Procure all permits and licenses, pay all charges and fees, and give all notices necessary and incident to the due and lawful prosecution of the work, including registration for transporting vehicles carrying the contaminated material and the hazardous material.
- Collect water from decontamination procedures and treat and/or dispose of it at an appropriate disposal site.
- Collect non-reusable protective equipment, once used by any personnel, and dispose of at an appropriate disposal site.
- Install temporary security fence to surround and secure the exclusion zone. Remove fencing when no longer needed.
- Excavation, transport, and disposal of contaminated material and hazardous material shall be in accordance with the rules and regulations of the following agencies (the specifications of these agencies supersede the procedures outlined in this BMP):
 - United States Department of Transportation (USDOT).
 - United States Environmental Protection Agency (USEPA).
 - California Environmental Protection Agency (CAL-EPA).

- California Division of Occupation Safety and Health Administration (CAL-OSHA).
- Local regulatory agencies.

Procedures for Underground Storage Tank Removals

- If an unknown underground storage tank is discovered, the contractor shall stop work in that area and immediately notify the RE. The contractor shall not resume work in the area until directed to do so.
- If tank removal operations are required by the contract, follow the contract requirements for obtaining permits and approval from the federal, state, and local agencies, which have jurisdiction over such work.
- If tank removal operations are required by the contract, the underground storage tank, any liquid and/or sludge found within the tank, and all contaminated substances and hazardous substances removed during the tank removal shall be transported to disposal facilities as required by the contract Specifications.

Water Control

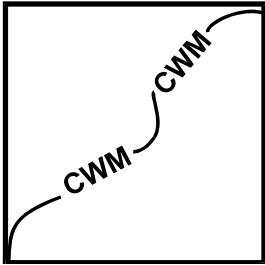

- Take all necessary precautions and preventive measures to prevent the flow of water, including ground water, from mixing with contaminated or hazardous materials or entering contaminated soil excavations. Such preventative measures may consist of, but are not limited to: berms, cofferdams, grout curtains, freeze walls, and seal course concrete or any combination thereof.
- If water does enter an excavation and becomes contaminated, such water, when necessary to proceed with the work, shall be dewatered consistent with NS-2, "Dewatering Operations" and the Caltrans *Field Guide to Construction Site Dewatering* Manual, and in compliance with the specifications.

Maintenance and Inspection

- The WPC Manager shall monitor on-site contaminated soil storage and disposal procedures.
- Monitor the air quality during excavation operations if required
- Manage contaminated soils and hazardous substances/waste under the appropriate federal, state, and local requirements.
- Inspect stockpiles, hazardous waste receptacles and storage areas regularly.

SWPPP or WPCP

- Contaminated Soil Management must be discussed in Section 500.4 of the SWPPP or Section 30.3.2 of the WPCP.

Tracking Control	<input type="checkbox"/>
Wind Erosion Control	<input type="checkbox"/>
Non-Stormwater Management	<input type="checkbox"/>
Materials and Waste Management	<input checked="" type="checkbox"/>

Definition and Purpose These are procedures and practices that are designed to minimize or eliminate the discharge of concrete waste materials to the storm drain systems or watercourses.

- Appropriate Applications**
- Concrete waste management procedures and practices are implemented on construction projects where concrete is used as a construction material or where concrete dust and debris result from demolition activities.
 - Where slurries containing portland cement concrete (PCC) or asphalt concrete (AC) are generated, such as from sawcutting, coring, grinding, grooving, and hydro-concrete demolition.
 - Where concrete trucks and other concrete-coated equipment are washed on site, when approved by the Resident Engineer (RE). See also NS-8, "Vehicle and Equipment Cleaning."
 - Where mortar-mixing stations exist.

Limitations ■ None identified.

- Standards and Specifications**
- Education**
- Educate employees, subcontractors, and suppliers on the concrete waste management techniques described herein.
 - The WPC Manager shall oversee and enforce concrete waste management procedures.

Concrete Demolition Wastes

- Stockpile concrete demolition wastes in accordance with BMP WM-3, “Stockpile Management.”
- Disposal of hardened PCC and AC waste shall be in conformance with Standard Specifications Section 14-10 Solid Waste Disposal and Recycling.

Concrete Slurry Waste Management and Disposal

- PCC and AC waste shall not be allowed to enter storm drainage systems or watercourses.
- A sign shall be installed adjacent to each temporary concrete washout facility to inform concrete equipment operators to utilize the proper facilities.
- The WPCM must ensure that onsite concrete working tasks are being monitored, such as saw cutting, coring, grinding and grooving to ensure proper methods are implemented.
- Residue from saw cutting, coring and grinding operations shall be picked up by means of a vacuum device. Residue shall not be allowed to flow across the pavement and shall not be left on the surface of the pavement. See also NS-3, “Paving and Grinding Operations.”
- Vacuumed slurry residue shall be disposed in accordance with WM-5, “Solid Waste Management” and Standard Specifications Section 7-1.13. Slurry residue shall be temporarily stored in a facility as described in “Onsite Temporary Concrete Washout Facility, Concrete Transit Truck Washout Procedures” below), or within an impermeable containment vessel or bin.
- Collect and dispose of all residues from grooving and grinding operations in accordance with Standard Specifications Section 14-10 Solid Waste Disposal and Recycling and Standard Specifications 14-11 Hazardous Waste and Contamination.

Onsite Temporary Concrete Washout Facility, Concrete Transit Truck Washout Procedures

- Temporary concrete washout facilities shall be located a minimum of 50 ft. from storm drain inlets, open drainage facilities, and watercourses, unless determined infeasible by the RE. Each facility shall be located away from construction traffic or access areas to prevent disturbance or tracking.
- A sign shall be installed adjacent to each washout facility to inform concrete equipment operators to utilize the proper facilities. The sign shall be installed as shown on the plans and in conformance with the provisions in Standard Specifications Section 56-2, Overhead Sign Structure.

- Temporary concrete washout facilities shall be constructed above grade or below grade at the option of the Contractor. Temporary concrete washout facilities shall be constructed and maintained in sufficient quantity and size to contain all liquid and concrete waste generated by washout operations.
- Temporary washout facilities shall have a temporary pit or bermed areas of sufficient volume to completely contain all liquid and waste concrete materials generated during washout procedures.
- Perform washout of concrete mixers, delivery trucks, and other delivery systems in designated areas only.
- Wash concrete only from mixer chutes into approved concrete washout facility. Washout may be collected in an impermeable bag or other impermeable containment devices for disposal.
- Pump excess concrete in concrete pump bin back into concrete mixer truck.
- Concrete washout from concrete pumper bins can be washed into concrete pumper trucks and discharged into designated washout area or properly disposed offsite.
- Once concrete wastes are washed into the designated area and allowed to harden, the concrete shall be broken up, removed, and disposed of in conformance with the provisions in Standard Specifications Section 7-1.13 or 15-3.02.

Temporary Concrete Washout Facility Type “Above Grade”

- Temporary concrete washout facility Type “Above Grade” shall be constructed as shown on Page 6 or 7, with a recommended minimum length and minimum width of 10 ft, but with sufficient quantity and volume to contain all liquid and concrete waste generated by washout operations. The length and width of a facility may be increased, at the Contractor’s expense, upon approval from the RE.
- Straw bales, wood stakes, and sandbag materials shall conform to the provisions in SC-9, "Straw Bale Barrier."
- Plastic lining material shall be a minimum of 10-mil polyethylene sheeting and shall be free of holes, tears or other defects that compromise the impermeability of the material. Liner seams shall be installed in accordance with manufacturers’ recommendations.

- Portable delineators shall conform to the provisions in Standard Specifications Section 12-3.04, "Portable Delineators." The delineator bases shall be cemented to the pavement in the same manner as provided for cementing pavement markers to pavement. Portable delineators shall be applied only to a clean, dry surface.

Temporary Concrete Washout Facility (Type Below Grade)

- Temporary concrete washout facility Type "Below Grade" shall be constructed as shown on page 6, with a recommended minimum length and minimum width of 10 ft. The quantity and volume shall be sufficient to contain all liquid and concrete waste generated by washout operations. The length and width of a facility may be increased, at the Contractor's expense, upon approval of the RE. Lath and flagging shall be commercial type.
- Plastic lining material shall be a minimum of 10-mil polyethylene sheeting and shall be free of holes, tears or other defects that compromise the impermeability of the material. Liner seams shall be installed in accordance with manufacturers' recommendations.
- The soil base shall be prepared free of rocks or other debris that may cause tears or holes in the plastic lining material.
- Temporary washout facilities shall implement BMPs to prevent run-on and run-off from the facility.

Removal of Temporary Concrete Washout Facilities

- When temporary concrete washout facilities are no longer required for the work, as determined by the RE, the hardened concrete shall be removed and disposed of. Disposal of PCC dried residues, slurries or liquid waste shall be disposed of outside the highway right-of-way in conformance with provisions of Standard Specifications Section 7-1-13. Materials used to construct temporary concrete washout facilities shall become the property of the Contractor, shall be removed from the site of the work, and shall be disposed of outside the highway right-of-way.
- Holes, depressions or other ground disturbance caused by the removal of the temporary concrete washout facilities shall be backfilled and repaired in conformance with the provisions in Standard Specifications Section 15-1.02, "Preservation of Property."

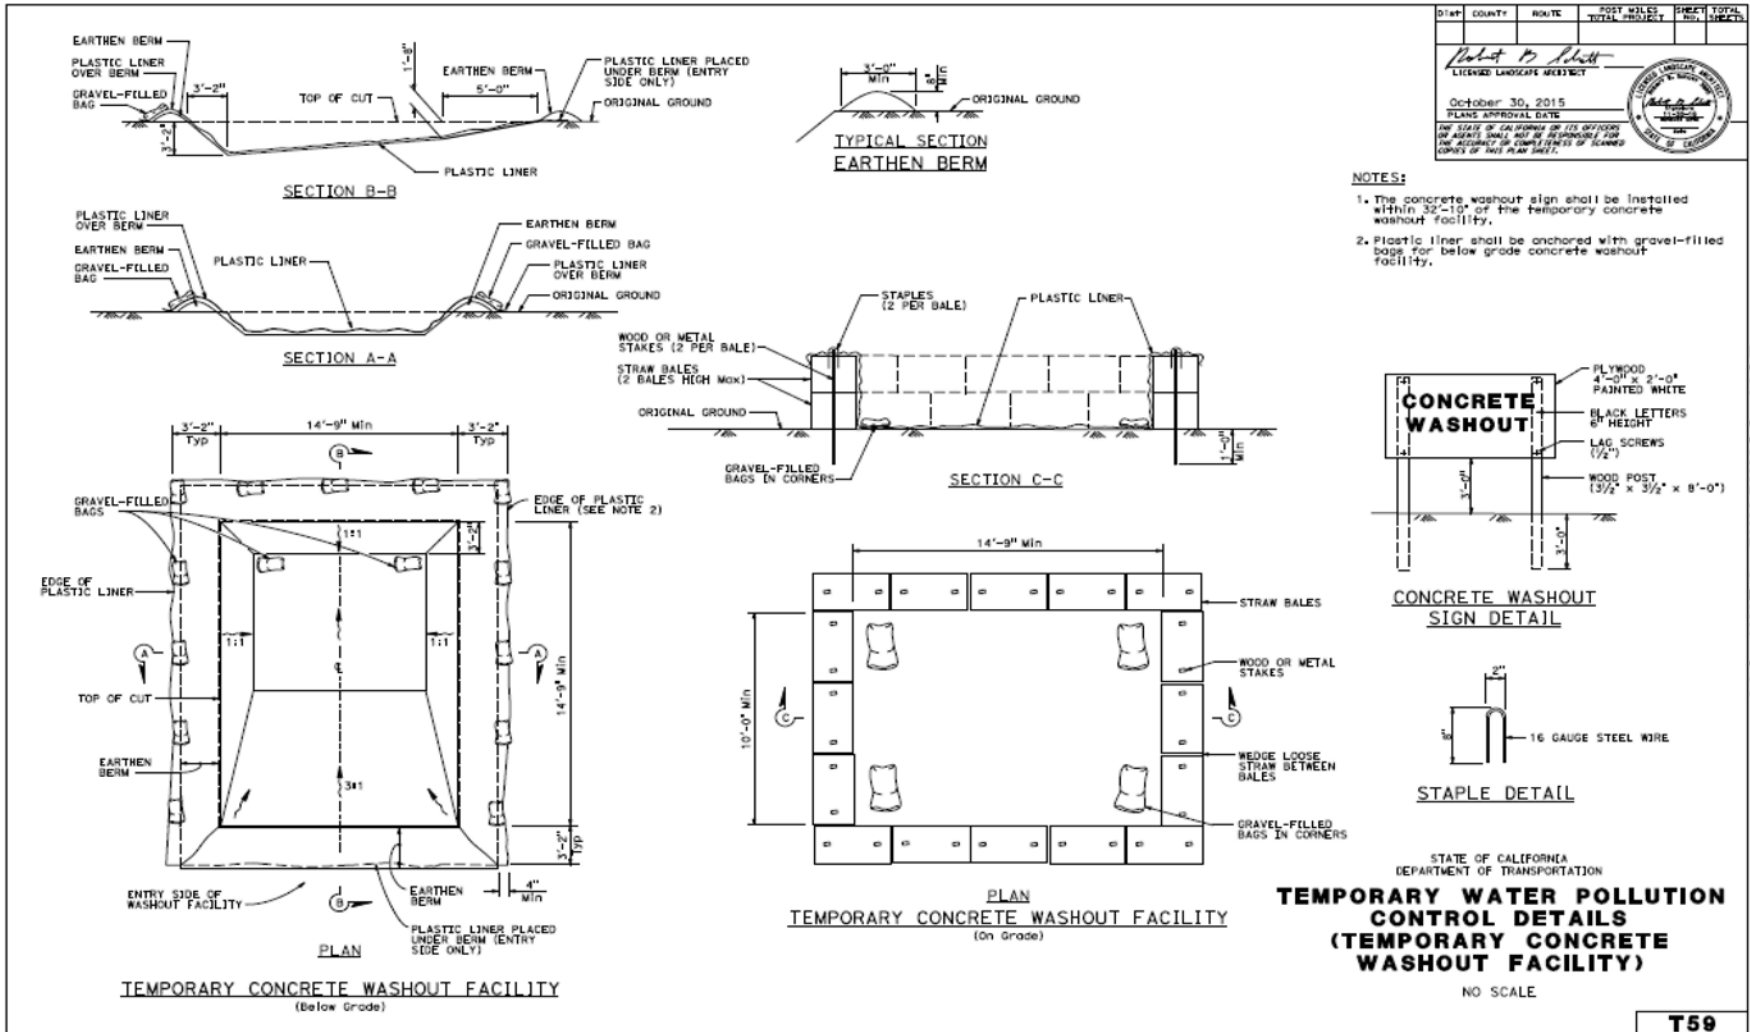

Maintenance and Inspection

- Inspect Concrete Waste Management areas before, during and after rainfall events, and at least weekly during other times.
- The WPC Manager shall monitor concrete working tasks, such as sawcutting, coring, grinding and grooving daily to ensure proper methods are employed or as directed by the RE.

- Temporary concrete washout facilities shall be maintained to provide adequate holding capacity with a minimum freeboard of 4 inches for above grade facilities and 12 inches for below grade facilities.
 - Maintaining temporary concrete washout facilities shall include removing and disposing of hardened concrete and returning the facilities to a functional condition.
 - Hardened concrete materials shall be removed and disposed of in conformance with the provisions in Standard Specifications Section 7-1.13 or 15-3.02.
 - Existing facilities must be cleaned, or new facilities must be constructed and ready for use once the washout is 75% full.
 - Temporary concrete washout facilities shall be inspected for damage (i.e. tears in polyethylene liner, missing sandbags, etc.). Damaged facilities shall be repaired.
 - Inspection and Maintenance of these areas must be properly documented and ensure no potential for discharges occur from these areas as part of the non-visible monitoring requirements.
- SWPPP or WPCP ■ Concrete Waste Management must be discussed in Section 500.4.2 of the SWPPP or Section 30.3.2 of the WPCP.

Concrete Waste Management

WM-8

Sanitary and Septic Waste Management

WM-9

Sediment Control	<input type="checkbox"/>
Tracking Control	<input type="checkbox"/>
Wind Erosion Control	<input type="checkbox"/>
Non-Stormwater Management	<input type="checkbox"/>
Materials and Waste Management	<input checked="" type="checkbox"/>

- Definition and Purpose** Procedures and practices to minimize or eliminate the discharge of construction site sanitary and septic waste materials to the storm drain system or to receiving waters.
- Appropriate Applications** Sanitary/septic waste management practices are implemented on all construction sites that use temporary or portable sanitary and septic waste systems.
- Limitations** None identified.
- Standards and Specifications** **Education**
- Educate employees, subcontractors, and suppliers on sanitary and septic waste storage and disposal procedures.
 - Educate employees, subcontractors, and suppliers of potential dangers to humans and the environment from sanitary/septic wastes.
 - Instruct employees, subcontractors, and suppliers in identification of sanitary/septic waste.
 - Hold regular meetings to discuss and reinforce disposal procedures (incorporate into regular safety meetings and tailgates).
 - Establish a continuing education program to indoctrinate new employees.

Sanitary and Septic Waste Management

WM-9

Storage and Disposal Procedures

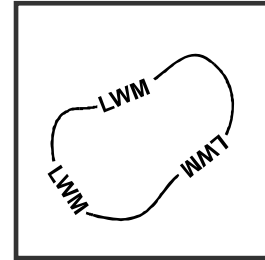

- Temporary sanitary facilities shall be located away from drainage facilities, receiving waters, and from traffic circulation.
- When subjected to high winds or risk for overtopping, temporary systems must be properly secured.
- Wastewater shall not be discharged or buried within the highway right-of-way.
- Sanitary and septic systems that discharge directly into sanitary sewer systems, where permissible, shall comply with the local health agency, city, county, and sewer district requirements.
- If using an on-site disposal system, such as a septic system, comply with local health agency requirements.
- Properly connect temporary sanitary facilities that discharge to the sanitary sewer system to avoid illicit discharges.
- Ensure that sanitary and septic facilities are maintained in good working order by a licensed service.
- Use only reputable, licensed sanitary/septic waste haulers.

Maintenance and Inspection

- Inspect onsite sanitary and septic waste storage and disposal procedures at least weekly, prior to a forecasted rain event, daily during extended rain events and post-storm events.
- Locations for portable Sanitary Systems must be shown on the WPCDs and reflect current site conditions.

SWPPP or WPCP

- Sanitary and Septic Waste Management must be discussed in Section 500.4.2 of the SWPPP or Section 30.3.2 of the WPCP.

Standard Symbol

BMP Objectives	
Soil Stabilization	<input type="checkbox"/>
Sediment Control	<input type="checkbox"/>
Tracking Control	<input type="checkbox"/>
Wind Erosion Control	<input type="checkbox"/>
Non-Stormwater Management	<input type="checkbox"/>
Materials and Waste Management	<input checked="" type="checkbox"/>

Definition and Purpose Procedures and practices to prevent discharge of pollutants to the storm drain system or to receiving waters as a result of the creation, collection, and disposal of non-hazardous liquid wastes.

Appropriate Applications Liquid waste management is applicable to construction projects that generate any of the following non-hazardous byproducts, residuals, or wastes:

- Drilling slurries and drilling fluids.
- Grease-free and oil-free wastewater and rinse water.
- Dredgings.
- Other non-storm water liquid discharges not permitted by separate permits.

Limitations

- Disposal of some liquid wastes may be subject to specific laws and regulations, or to requirements of other permits secured for the construction project (e.g., NPDES permits, Army Corps permits, Coastal Commission permits, etc.).
- Does not apply to dewatering operations (see NS-2, “Dewatering Operations”), solid waste management (see WM-5, “Solid Waste Management”), hazardous wastes (see WM-6, “Hazardous Waste Management”), or concrete slurry residue (see WM-8, “Concrete Waste Management”).

- Does not apply to non-stormwater discharges permitted by any NPDES permit held by the pertinent Caltrans District, unless the discharge is determined by Caltrans to be a source of pollutants. Typical permitted non-stormwater discharges can include: water line flushing; landscape irrigation; diverted stream flows; rising ground waters; uncontaminated pumped ground water; discharges from potable water sources; foundation drains; irrigation water; springs; water from crawl space pumps; footing drains; lawn watering; flows from riparian habitats and wetlands; and, discharges or flows from emergency firefighting activities. See 2016 SWMP for complete list of permitted non-stormwater discharges.

Standards and Specifications

General Practices

- Must comply with Standard Specification 13-4.03 Spill Prevention and Control.
- The WPC Manager shall oversee and enforce proper liquid waste management procedures and practices.
- Instruct employees and subcontractors how to safely differentiate between non-hazardous liquid waste and potential or known hazardous liquid waste.
- Instruct employees, subcontractors, and suppliers that it is unacceptable for any liquid waste to enter any storm drainage structure, waterway, or receiving water.
- Educate employees and subcontractors on liquid waste generating activities, and liquid waste storage and disposal procedures.
- Hold regular meetings to discuss and reinforce disposal procedures (incorporate into regular safety meetings and tailgates).
- Verify which non-stormwater discharges are permitted by the Caltrans NPDES permit; different regions might have different requirements not outlined in this permit. Some listed discharges may be prohibited if Caltrans determines the discharge to be a source of pollutants.
- Apply the NS-8, “Vehicle and Equipment Cleaning” BMP for managing wash water and rinse water from vehicle and equipment cleaning operations.

Containing Liquid Wastes

- Drilling residue and drilling fluids shall not be allowed to enter storm drains and receiving waters and shall be disposed of outside the highway right-of-way in conformance with the provisions in Standard Specifications.
- If an appropriate location is available, as determined by the RE, drilling residue and drilling fluids that are exempt under California Code of Regulations (CCR) Title 23 §2511(g) may be dried by infiltration and evaporation in a containment facility constructed in conformance with the

provisions concerning the Temporary Concrete Washout Facilities detailed in WM-08, “Concrete Waste Management.”

- Liquid wastes generated as part of an operational procedure, such as water-laden dredged material and drilling mud, shall be contained and not allowed to flow into drainage channels or receiving waters prior to treatment.
- Contain liquid wastes in a controlled area, such as a holding pit, sediment basin, roll-off bin, or portable tank.
- Containment devices must be structurally sound and leak free.
- Containment devices must be of sufficient quantity or volume to completely contain the liquid wastes generated.
- Take precautions to avoid spills or accidental releases of contained liquid wastes. Apply the education measures and spill response procedures outlined in WM-4, “Spill Prevention and Control.”
- Do not locate containment areas or devices where accidental release of the contained liquid can threaten health or safety, or discharge to water bodies, channels, or storm drains.

Capturing Liquid Wastes

- Capture all liquid wastes running off a surface, which has the potential to affect the storm drainage system, such as wash water and rinse water from cleaning walls or pavement.
- Do not allow liquid wastes to flow or discharge uncontrolled. Use temporary dikes or berms to intercept flows and direct them to a containment area or device for capture.
- If the liquid waste is sediment laden, use a sediment trap SC-3, “Sediment Trap/Curb Cutback” for capturing and treating the liquid waste stream, or capture in a containment device and allow sediment to settle.

Disposing of Liquid Wastes

- Typical method is to dewater the contained liquid waste, using procedures such as described in NS-2, “Dewatering Operations”, and SC-2, “Sediment/Desilting Basin”; and dispose of resulting solids per WM-5, “Solid Waste Management.”
- Method of disposal for some liquid wastes may be prescribed in Water Quality Reports, NPDES permits, Environmental Impact Reports, 401 Water Quality Certifications or 404 permits, local agency discharge permits, etc., and may be defined elsewhere in the special provisions.

- Liquid wastes, such as from dredged material, may require testing and certification whether it is hazardous or not before a disposal method can be determined.
 - For disposal of hazardous waste, see WM-6, “Hazardous Waste Management.”
 - If necessary, further treat liquid wastes prior to disposal. Treatment may include, though is not limited to, sedimentation, filtration, and chemical neutralization.
- Maintenance and Inspection
- Spot check employees and subcontractors at least monthly throughout the job to ensure appropriate practices are being employed. At a minimum, liquid waste containment areas must be inspected before, during and after rain events, findings must be properly documented and any deficiencies timely corrected.
 - Remove deposited solids in containment areas and capturing devices as needed, and at the completion of the task. Dispose of any solids as described in WM-5, “Solid Waste Management.”
 - Inspect containment areas and capturing devices frequently for damage, and repair as needed.
 - Improper storage, containment or disposal might trigger sampling requirements per section 700 of the SWPPP.
 - Locations for Liquid Waste Management must be shown on the WPCDs and reflect current site conditions.
- SWPPP or WPCP
- Liquid Waste Management must be discussed in Section 500.4 of the SWPPP or Section 30.3 of the WPCP.

Appendix A: Definition of Terms

This page intentionally left blank.

Appendix A

Definition of Terms

Active Areas. An area where soil disturbing activities have occurred at least once within 14 days.

Areas of Construction. All areas subject to land surface disturbance activities related to the project including, but not limited to, project staging areas, immediate access areas and storage areas.

Active Treatment System (ATS). A treatment system that employs chemical coagulation, chemical flocculation, or electrocoagulation to aid in the reduction of turbidity caused by fine suspended sediment.

Air Deposition. Airborne particulates from construction activities.

Best Available Technology Economically Achievable (BAT). As defined by USEPA, BAT is a technology-based standard established by the CWA as the most appropriate means available on a national basis for controlling the direct discharge of toxic and nonconventional pollutants to navigable waters. The BAT effluent limitations guidelines, in general, represent the best existing performance of treatment technologies that are economically achievable within an industrial point source category or subcategory.

Best Conventional Pollutant Control Technology (BCT). As defined by USEPA, BCT is a technology-based standard for the discharge from existing industrial point sources of conventional pollutants including BOD, total suspended sediment (TSS), fecal coliform, pH, oil and grease.

Best Management Practices (BMPs). BMPs are scheduling of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the discharge of pollutants. BMPs also include treatment requirements, operating procedures, and practices to control site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage.

Caltrans Permit. The Caltrans Statewide NPDES Permit for discharges from Caltrans properties, facilities, and activities (Order No. 2012-011-DWQ, NPDES No. CAS000003), issues by the SWRCB.

Construction Activity. Includes clearing, grading, or excavation and Contractor activities that result in soil disturbance.

Construction Site. The area involved in a construction project as a whole.

Construction Site BMPs. Temporary control practices (BMPs) that are required only temporarily to address a short-term stormwater contamination threat as a result of construction activities. For example, silt fences are located near the base of newly graded slopes that have substantial area of exposed soil. Then, during rainfall, the silt fences allow capture of sediment from erosion of the slopes.

Contractor. Party responsible for carrying out the contract per plans and specifications. The Standard Specifications and contract special provisions contain stormwater protection requirements the Contractor must address.

Contractor-Support Facilities. Contractor-support facilities include: Staging areas, storage yards for equipment and materials, mobile operations, batch plants for Portland Cement Concrete and Hot Mix Asphalt, crushing plants for rock and aggregate, other facilities installed for Contractor convenience such as haul roads.

Debris. Litter, rubble, discarded refuse, and remains of destroyed inorganic anthropogenic waste.

Direct Discharge. When surface runoff directly enters the surface water body without first flowing through a municipal separate storm sewer system (MS4).

Discharge. Any release, spill, leak, pump, flow, escape, dumping, or disposal of any liquid, semi-solid or solid substance.

Disturbed Soil Areas (DSAs). Areas of exposed, erodible soil, including stockpiles, that are within the construction limits and that result from construction activities.

Drainage Area. The area of land that drains water, sediment, pollutants, and dissolved materials to a common outlet.

Effluent. Any discharge of water by a discharger either to the receiving water or beyond the property boundary controlled by the discharger.

Environmental Protection Agency (EPA). Agency that issued the regulations to control pollutants in stormwater runoff discharges (The Clean Water Act and NPDES permit requirements).

Erosion. The process, by which soil particles are detached and transported by the actions of wind, water, or gravity.

Erosion Control BMPs. Vegetation, such as grasses and wildflowers, and other materials, such as straw, fiber, stabilizing emulsion, protective blankets, etc., placed to stabilize areas of disturbed soils, reduce loss of soil due to the action of water or wind, and prevent water pollution.

Exempt Construction Activities. Activities exempt from the CGP, including routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of the facility; and emergency construction activities required to protect public health and safety. Local permits may not exempt these activities.

Existing vegetation. Any vegetated area that has not already been cleared and grubbed.

Final Stabilization. All soil disturbing activities at each individual parcel within the site have been completed in a manner consistent with the requirements in this General Permit.

Forecasted Storm Event. A storm that produces or is forecasted to produce at least 0.10 inch of precipitation within a 24-hour period.

General Permit. The Construction General Permit for Storm Water Discharges Associated with Construction Activity (Order No. 2009-000-DWQ, NPDES Permit CAS000002) and amendments (Order No. 2010-0014-DWQ and Order No. 2012-0006-DWQ) issued by the SWRCB.

Good Housekeeping. A common practice related to the storage, use, or cleanup of materials, performed in a manner that minimizes the discharge of pollutants.

Good Housekeeping BMPs. BMPs designed to reduce or eliminate the addition of pollutants to construction site runoff through analysis of pollutant sources, implementation of proper handling/disposal practices, employee education, and other actions. Grading Phase (part of the Grading and Land Development Phase) includes reconfiguring the topography and slope including; alluvium removals; canyon cleanouts; rock undercuts; keyway excavations; land form grading; and stockpiling of select material for capping operations.

Illegal Connection. Discarding or disposal within the Caltrans right-of-way, properties or facilities, either intentionally or unintentionally, of trash or other wastes in non-designated areas that may contribute to stormwater pollution.

Illegal Dumping. An engineered conveyance that is connected to an MS4 without authorization by local, state, or federal statutes, ordinances, codes or regulations.

Illicit Discharge. Any discharge to an MS4 that is prohibited under local, state, or federal statutes, ordinances, codes or regulations. It includes all non-stormwater discharges except conditionally exempt non-stormwater discharges.

Inactive Construction Area. Any area not considered to be an active construction area. Active construction areas become inactive construction areas whenever construction activities are expected to be discontinued for a period of 14 days or longer.

Indirect Discharge. When surface runoff enters the surface water body through an MS4 stormwater conveyance system or unlisted tributary before reaching the surface water.

National Pollutant Discharge Elimination System (NPDES) Permit. A permit issued pursuant to the CWA that requires the discharge of pollutants to waters of the United States from stormwater be controlled.

Non-Storm Water Discharges. Non-Storm Water Discharges are discharges that do not originate from forecasted storm events. They can include, but are not limited to, discharges of process water, air conditioner condensate, non-contact cooling water, vehicle wash water, sanitary wastes, concrete washout water, paint wash water, irrigation water, or pipe testing water.

Non-Visible Pollutants. Pollutants associated with a specific site or activity that can have a negative impact on water quality, but cannot be seen through observation (ex: chlorine). Such pollutants being discharged are not authorized.

pH. Unit universally used to express the intensity of the acid or alkaline condition of a water sample. The pH of natural waters tends to range between 6 and 9, with neutral being 7. Extremes of pH can have deleterious effects on aquatic systems.

Pollution. The man-made or man-induced alteration of the chemical, physical, biological, and radiological integrity of water. An alteration of the quality of the water of the state by waste to a degree, which unreasonably affects either the waters for beneficial uses or facilities that serve these beneficial uses.

Post-Construction BMPs. Structural and non-structural controls which detain, retain, or filter the release of pollutants to receiving waters after final stabilization is attained.

Qualified SWPPP Developer (QSD). Individual who is authorized to develop and revise SWPPPs.

Qualified SWPPP Practitioner (QSP). Individual assigned responsibility for non-storm water and storm water visual observations, sampling and analysis, and responsibility to ensure full compliance with the permit and implementation of all elements of the SWPPP, including the preparation of the annual compliance evaluation and the elimination of all unauthorized discharges.

Receiving Waters. All surface water bodies within the permit area.

Regional Water Quality Control Board (RWQCB). California agencies that implement and enforce CWA Section 402(p) NPDES permit requirements, and are issuers and administrators of these permits as delegated by USEPA. There are nine regional boards working with the SWRCB.

Resident Engineer (RE). The Caltrans representative charged with administration of construction contracts. The RE decides questions regarding acceptability of material furnished and work performed. The RE has "contractual authority" to direct the Contractor and impose sanctions if the Contractor fails to take prompt and appropriate action to correct deficiencies. The following contractual sanctions can be imposed by the RE: (a) withholding payments (or portions of payments), (b) suspending work, (c) bringing in a separate Contractor to complete work items (the Contractor is billed for such costs), (d) assessing liquidated damages including passing along fines for permit violations, (e) initiating cancellation of the construction contract.

Routine Maintenance. Activities intended to maintain the original line and grade, hydraulic capacity, or original purpose of a facility.

Runoff Control BMPs. Measures used to divert run-on from off-site and runoff within the site.

Runoff Effect. The effect that a particular soil stabilization product has on the production of stormwater runoff. Runoff from an area protected by a particular product may be compared to the amount of runoff measured for bare soil

Run-on. Discharges that originate off-site and flow onto the property of a separate project site.

Sediment. Solid particulate matter, both mineral and organic, that is in suspension, is being transported, or has been moved from its site of origin by air, water, gravity, or ice and has come to rest on the earth's surface either above or below sea level.

Sedimentation. Process of deposition of suspended matter carried by water, wastewater, or other liquids, by gravity. It is usually accomplished by reducing the velocity of the liquid below the point at which it can transport the suspended material.

Sediment Control BMPs. Practices that trap soil particles after they have been eroded by rain, flowing water, or wind. They include those practices that intercept and slow or detain the flow of storm water to allow sediment to settle and be trapped (e.g., silt fence, sediment basin, fiber rolls, etc.).

Sheet Flow. Flow of water that occurs overland in areas where there are no defined channels where the water spreads out over a large area at a uniform depth.

Soil Amendment. Any material that is added to the soil to change its chemical properties, engineering properties, or erosion resistance that could become mobilized by storm water.

State Water Resources Control Board (SWRCB). California agency that implements and enforces CWA Section 402(p) NPDES permit requirements, is issuer and administrator of these permits as delegated by EPA. Works with the nine Regional Water Quality Control Boards.

Storm Drain System. Streets, gutters, inlets, conduits, natural or artificial drains, channels and watercourses, or other facilities that are owned, operated, maintained and used for the purpose of collecting, storing, transporting, or disposing of stormwater.

Stormwater. Rainfall runoff, snow melt runoff, and surface runoff and drainage. It excludes infiltration and runoff from agricultural land.

Stormwater Pollution Prevention Plan (SWPPP). A plan required by the CGP or the LTCGP that includes site map(s), an identification of construction/contractor activities that could cause pollutants in the stormwater, and a description of measures or practices to control these pollutants. It must be prepared and authorized before construction begins. A SWPPP prepared in accordance with the Special Provisions and the Handbooks will satisfy Standard Specifications Section 13 Water Pollution Control

Temporary Construction Site BMPs. Construction Site BMPs that are required only temporarily to address a short-term stormwater contamination threat. For example, silt fences are located near the base of newly graded slopes that have a substantial area of exposed soil. Then, during rainfall, the silt fences filter and collect sediment from runoff flowing off the slope.

Water Pollution Control Manager (WPC Manager). The person responsible for the implementation of the SWPPP or WPCP, whichever is applicable for the project. The WPC Manager must be a QSP whenever the project requires a WPCP. The WPC Manager must be a QSD whenever the project requires a SWPPP.

Water Pollution Control Program (WPCP). A WPCP is a plan to identify water quality management practices to be implemented that must be prepared for all construction projects that do not require preparation of a SWPPP. For Caltrans projects disturbing more than one acre, a SWPPP satisfies the requirement for a WPCP.

Waters of the United States. Generally, refers to surface waters, as defined by the federal Environmental Water quality objectives are defined in the California Water Code as limits or levels of water quality constituents or characteristics, which are established for the reasonable protection of beneficial uses of water or the prevention of nuisance within a specific area.

Appendix B: Selection of Temporary Soil Stabilization Controls

This page intentionally left blank.

Appendix B

Selection of Temporary Soil Stabilization Controls

Temporary Soil Stabilization BMPs (SS BMPs) are designed to eliminate or reduce the erosion of disturbed soil areas and to reduce the transport of sediment and pollutants by stormwater during construction. SS BMPs are used to bind soil particles together, or coat the disturbed soil surface area, thereby protecting the disturbed soil area from the erosive forces of water and wind.

Section 3 of this Manual provides guidance on the selection, limitations, installation, and maintenance for approved SS BMPs. This appendix provides additional details for Field Staff and Contractors on relevant factors to consider for selecting appropriate products for project specific construction sites/areas.

Caltrans has approved six types of SS BMPs (Standard Specifications Section 13-5) listed below. These BMPs are to be applied to disturbed soil areas to eliminate or reduce erosion and the potential transport and discharge of sediment and other pollutants from Caltrans right-of-way. The SS BMPs listed as sub bullets are acceptable alternatives because they have the same general function. For example, when a project requires the use of Mulch (SS-3) both Temporary Hydraulic Mulch or Temporary Bonded Fiber Matrix Hydraulic Mulch can be used to meet the requirement.

- Mulch (SS-3)
 - Temporary Hydraulic Mulch
 - Temporary Bonded Fiber Matrix Hydraulic Mulch
- Temporary Hydroseed (SS-4)
- Soil Binders (SS-5)
 - Temporary Cementitious Binder Hydraulic Mulch
 - Temporary Soil Binder
- Temporary Tacked Straw (SS-6)
 - Temporary Tacked Straw
- Temporary Rolled Erosion Control Products (SS-7)
 - Temporary Erosion Control Blanket
 - Erosion Control Blanket
 - Temporary Covers
- Temporary Wood Mulch (SS-8)
 - Temporary Mulch

Subsection B.1 includes general factors that should be considered when the SS BMPs listed above may be selected. Subsection B.2 includes a flowchart and tables that will guide the user through the site evaluation to optimize the selection of SS BMPs for the specific construction area. Subsection B.3 includes some general description of sediment control BMPs, as they should be used in conjunction with SS BMPs to optimize BMP coverage and comply with Permit requirements.

B.1 – General factors to consider for maximizing usage of Temporary Soil Stabilization BMPs

Understanding the characteristics of a construction site/area, including how it will impact stormwater and how stormwater will impact it, is important for SS BMP planning and selection. The following characteristics must be considered before selecting a SS BMP(s).

- Preparing soil to optimize SS BMP effectiveness
 - The proper application of SS BMPs can be improved by ensuring that the area(s) that will receive SS BMPs have adequate soil preparation, whether it is track walking the slope, imprinting, or using soil amendments, or to ensure long-term vegetation sustainability having seed testing done prior to seeding the area. These techniques, in conjunction with the selection of correct SS BMP, can prevent sediment-laden discharges, reduce the need for continuous maintenance, and increase establishment of permanent vegetative cover.
- Proper Timing for application of SS BMPs
 - Consider the timing of construction as it relates to the seasonal distribution of erosive rainfall and the climate regime that the construction site/area is located in. Large areas of California are located in a Mediterranean climate regime where summers are hot and dry and winters are cool and rainy. Simply timing the application of stabilization measures prior to the beginning of the rainy season in late fall makes a significant difference in erosion and sediment delivery rates. Construction during a period of high erosive potential requires a much shorter bare soil period and will influence the choice of sediment controls. Those sediment controls that provide instant protection will be preferred over those requiring germination and establishment of vegetation.
- Determining the Specific Soil Erosivity Potential
 - A proper evaluation of the soil erosive potential and sediment delivery rates for the project specific construction site/area during the planned construction period is crucial to preventing both multiple applications of SS BMPs and sediment-laden discharges. Caltrans has a variety of tools available, from their refined RUSLE, which conform to Caltrans construction sites and is more user friendly, to the Caltrans Landscape Architecture Toolbox which can be accessed via http://www.dot.ca.gov/hq/LandArch/16_la_design/guidance/roadside_safety_tb/index.htm. The RUSLE assessment and the Landscape Toolbox can be used to evaluate soil conditions, erosivity potential, and proposed soil stabilization concepts for any construction sites/areas, even those that are less than an acre in size, and not subject to CGP or LTCGP.

B.2 Site Evaluation

The following flowchart and tables are an abridged and modified summary of the *Guidance for Temporary Soil Stabilization* (July 2003) and it is intended to be used to determine the most appropriate SS BMP to be deployed. All steps shown in Figure B-1 must be completed.

Step 1 – Start.

The Construction Field Staff or Contractor should use Figure B-1, the guidance provided in this section, and the tables that follow to determine the best option to stabilize the project specific construction site/area.

Continue to the next step.

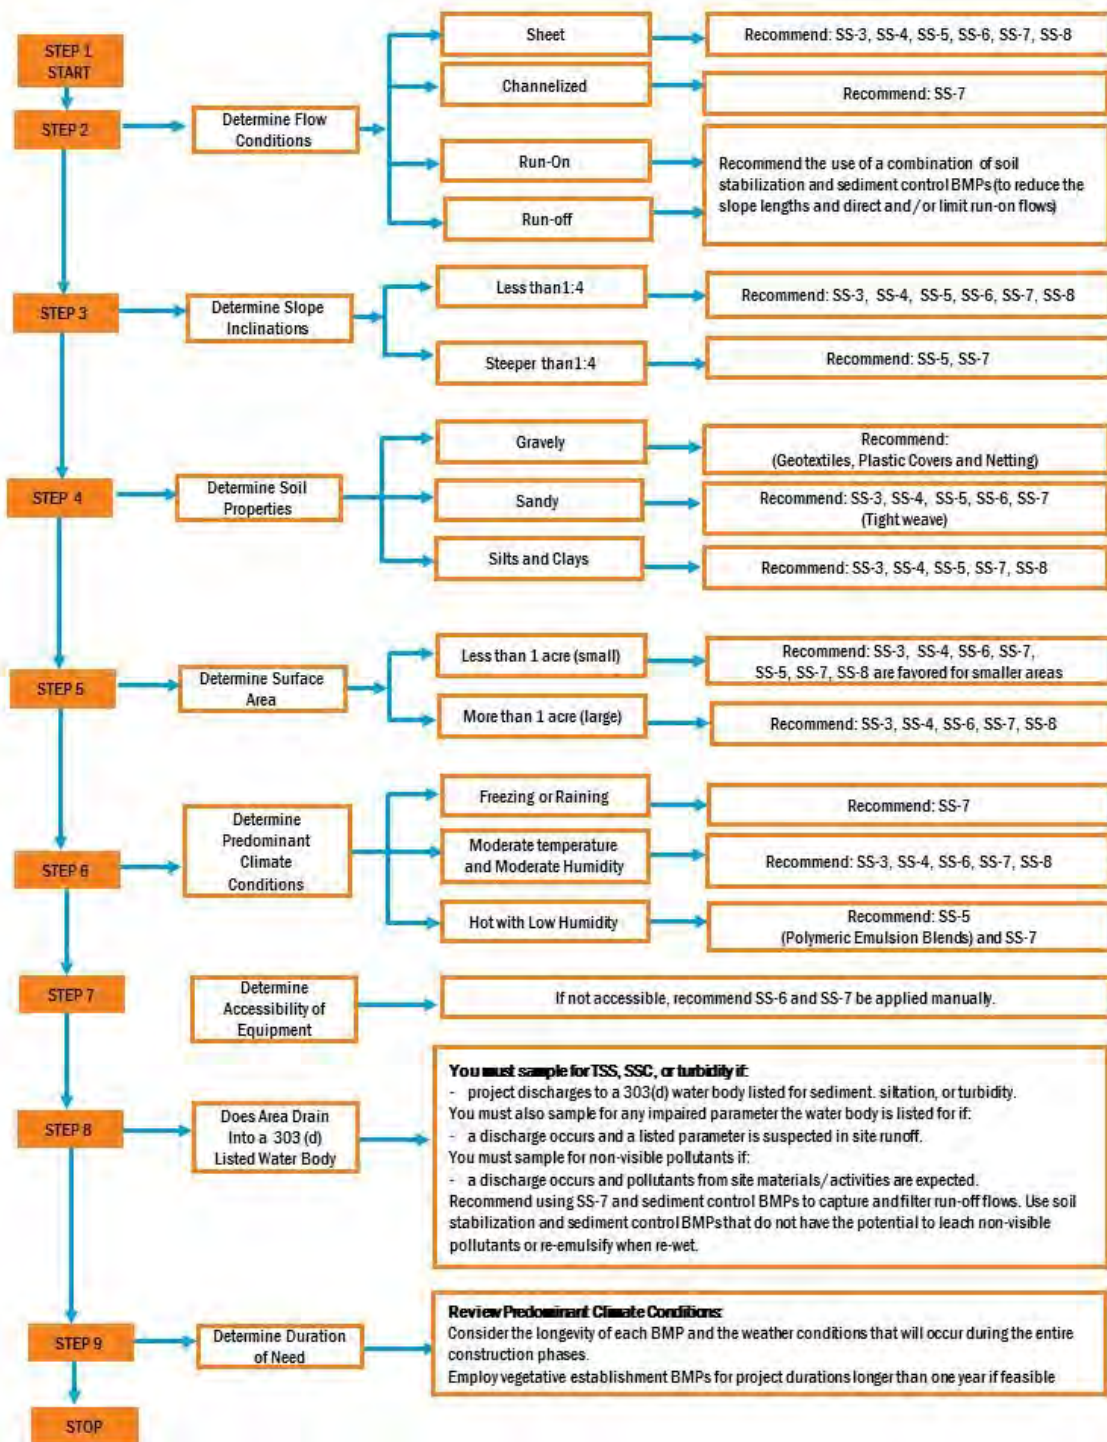

Figure B-1. Consideration of Temporary SS BMPs

Step 2-Assess the flow conditions for the area that will receive the SS BMP.

- Sheet Flow
- Channelized Flow
- Run-on Flow
- Run-off Flow

As velocities increase, the options for SS BMPs decrease. Areas that will receive direct run-on or run-off must be hydraulically evaluated to ensure there will be no additional sediment deposition. It is recommended to use a combination of SS BMPs and Temporary Sediment Control BMPs (SC BMPs) to control impacts due to run-on or run-off.

There are specific inspection requirements in the CGP or the LTCGP that must be complied with and documented by the QSP or QSD as noted in the flowchart.

Continue to the next step.

Step 3-Assess the Slope Inclination and Slope Length of area that will receive the SS BMP.

- Less than 1:4 (V:H)
- Greater than 1:2 (V:H)

The slope length is measured or calculated along the continuous inclined surface. A discrete slope can be measured between the following criteria:

- From the top of the slope to the toe of the slope (if there are no benches¹)
- From the top of the slope to the bench directly below within the slope.
- From a bench within the slope to the bench directly below within the slope.
- The lowest bench within the slope to the toe of the slope.

Continue to the next step.

Step 4-Assess the soil properties and erodibility for the area that will receive the SS BMP

Soil properties relate to available soil moisture, available soil nutrients for plant growth, and depth and presence of rock fragments that hinder temporary and permanent seeding establishment. When choosing temporary measures on various soils, the larger concern is the erosion potential (erodibility) of the soil.

soil erosion rates can be predicted by RUSLE2 on construction sites/areas. RUSLE2 uses USDA Soil Survey data which contains the soil erodibility or K factor for all mineral soils. RUSLE2 requires a K factor to run so in cases where the soil has been disturbed or when no soil K factors range from 0.01 to 0.64. The higher the k the higher the potential erosion rate.

Table B.2-1 provides the soil properties in relation to the Unified Soil Classification and USDA Texture.

¹ A bench is a drainage feature or a Temporary Sediment Control BMP that intercepts surface flow and conveys the resulting concentrated flow away from the slope.

Table B.2-1 Soil properties						
USDA Texture	Unified Soil Classification	K factor Undisturbed Condition	General Erodibility	K factor Highly Disturbed Conditions	Hydrologic Class	General Runoff Classification
Gravelly Clay	GC	0.17	Low	-	D	Highest

	CL	0.32	Moderate	0.26	C	Moderately High
	CL	0.37	Moderate	0.29	D	Highest

Continue to the next step.

Step 5-What is the total surface area that will receive the SS BMP

Surface area is the amount of disturbed soil area on the construction site/area that will require protection from erosion with various SS BMPs. Surface area categories are grouped in the following way:

- Small: 1 acre or less
- Large: 1 acre or more

In order to maximize effectiveness, the field staff must ensure that the surface area to be stabilized is adequate for the stabilization crew to complete their application prior to onset of rain, and can be accessed as discussed in steps below

Continue to the next step.

Step 6-What is the Predominant Climate Atmospheric Condition on the day the soil stabilization will be installed

Atmospheric conditions on the day of installation can limit the type of BMP that can be applied to the disturbed soil area because some SS BMPs are not effective in extreme weather conditions such as snow or heat. Other BMPs may require drying times and should not be applied to slopes while it is raining. Climate variations are caused primarily by distance from the coast and elevation. When selecting SS BMPs consider the temperature ranges, frequency and intensity of rainfall, wind, and humidity.

Continue to the next step.

Step 7- Any issues with Accessibility of Equipment

The accessibility of equipment refers to whether a road or pad capable of supporting equipment for applying SS BMPs is within range of the disturbed soil area. If the construction site/area does not have vehicular access, only SS BMPs applied manually are applicable.

Continue to the next step.

Step 8-Where is the site discharging to, any 303(d) Listed Water Bodies?

Within the Clean Water Act regulations, Section 303(d) listed water bodies that are impaired by various pollutants and are designated for developing Total Maximum Daily Loads (TMDLs). If a construction site drains into a Section 303(d) listed water body, understanding and meeting the required TMDL is essential for compliance.

It is essential to understand site run-off dynamics and control needs. The limitations of the SS BMPs, with respect to their potential water quality impacts, must be clearly understood. Proper selection and installation of SS BMPs can facilitate compliance by eliminating pollutants that discharge into Section 303(d) listed water bodies.

Continue to the next step.

Step 9- What is the duration of need?

The timeframe for which SS BMPs are needed will depend on the construction schedule and has a direct correlation to the longevity of the temporary SS BMP selected. Longevity ranges are typically:

- Less than 3 months
- Between 3 and 12 months
- Greater than 12 months
 - Stop.

Construction site/area characteristics applicable to the SS BMPs are provided in Table B.2.2 while the timing and cost associated with the SS BMPs are provided in Table B.2.3.

Reference: Guidance for Temporary Soil Stabilization (Caltrans, 2003)

Reference: Guidance for Temporary Soil Stabilization (Caltrans, 2003)

NA – Not Applicable

(1): Conservative Maximum Slope Inclination (V:H) recommended by Caltrans for product applicability, manufacturer may recommend greater slope inclinations

(2): Are not applicable with hydroseeding. Plastic materials should not be used for more permanent applications, near ESAs, or where prohibited by regulatory permits.

(3): Using hydroseed with turf reinforcement mats in channelized flow situations may have limited success due to potentially turbulent flows.

A: The BMP cannot be applied during a storm event or freezing conditions. Avoid applying in strong winds and over spraying. B: The disturbed soil area must be accessible to equipment.

B: If disturbed soil area drains to 303(d) listed water body, potential non-visible pollutant.

C: If disturbed soil area drains to 303(d) listed water body, potential pollutants if breach or malfunction occurs.

D: The product is applied manually; therefore, road or pad proximity limitations do not affect their applicability.

F: May be difficult to insert pins into frozen ground.

G: Data obtained from the URS Greiner Woodward Clyde, Soil Stabilization for Temporary Slopes, 1999

B.3 Additional BMPs Used with SS BMPs

SS BMPs are more effective when used in conjunction with Temporary Sediment Control BMPs (SC BMPs) and other SS BMPs. To properly stabilize slopes and remove sediment from stormwater, other conditions must be addressed such as, directing and/or slowing concentrated flow, reducing slope lengths, and capturing sediment entrained in stormwater. Therefore, it is required that SS BMPs and SC BMPs are used in conjunction to comply with the General Construction Permit rules regarding erosion and sediment control.

Slope inclination and slope length are the most important factors affecting the installation of combined stabilizations BMPs and SC BMPs, as these factors have the largest potential impact on erosion rates. A combined increase in slope inclination and slope length will require an increase in the use of SS BMPs and SC BMPs.

To limit the erosive effects of stormwater flow the slope lengths shall be broken up with SC BMPs such as fiber rolls or gravel bags as follows:

- If the slope inclination is 1:4 (V:H) or flatter, break up the slope length with sediment control BMPs at intervals no greater than 20 feet.
- If the slope length is between 1:4 (V:H) and 1:2 (V:H), break up the slope length with sediment control BMPs at intervals no greater than 15 feet.
- If the slope inclination is 1:2 (V:H) or greater, break up the slope length with sediment control BMPs at intervals no greater than 10 feet.

Listed below are the SC BMPs applied to compliment the SS BMPs that cover or bind the soil of the disturbed soil areas (Standard Specifications 13-6 and 13-10). The information below also includes a brief explanation of their purpose and applications. Refer Section 4 of this Manual for details regarding the Limitations, Standards and Specifications, and design of SC BMPs. SC BMPs are implemented on a project-by-project basis and with other SS BMPs.

- Temporary Earthen Berm
- Temporary Silt Fences
- Temporary Reinforced Silt Fences

Appendix C: Active Treatment Systems

This page intentionally left blank.

Appendix C

Active Treatment Systems

C.1 Introduction

Temporary Active Treatment Systems (ATS) apply conventional water treatment technologies, in use for over a century, to stormwater quality. Neither the CGP nor the LTCGP requires the use of an ATS, but for waters and sites where the reliability of the stormwater quality is of concern, these systems may be used.

C.1.1 Overview

An ATS may be considered for a project under the following conditions:

- When necessary to meet water quality standards (WQS) of the receiving water.
- When necessary to meet the effluent limits of the CGP or LTCGP for turbidity and pH in stormwater.

Under the CGP and the LTCGP, an ATS is recommended for use at high risk work sites, including:

- Where space limits installation of properly-sized containment and detention facilities, such as a sediment trap (see SC-3 “Sediment Trap”) or sediment/desilting basin (see SC-2 “Sediment/Desilting Basin”).
- Where clay and/or highly erosive soils are present.
- Where the site has very steep slopes
- Where project work necessitates on-going and large amounts of disturbed soil area during the rainy season
- Where the project site is highly susceptible to stormwater run-on resulting in erosion and sediment-laden run-off.

An ATS uses a coagulant for the treatment of water with a sedimentation basin (or basins) for facilitating turbidity reduction. In addition, pH adjustment plus bag/cartridge/sand filters may be included. The exact configuration and sizing of the ATS will depend on the anticipated quantity and quality of the water to be treated, the amount of time needed for treatment, and receiving water requirements.

Coagulation can be used to destabilize suspended particles and remove them from suspension, which forms a byproduct referred to as floc or flocculant. There are many different coagulants for use; a coagulant may use different chemical properties and may be suited for different types of water conditions to be treated. Potential chemical residual (i.e., coagulant residual) in the treated effluent must be monitored and managed to attain applicable effluent limits prior to discharge.

An ATS is recommended to remove particles below 0.02 mm and may be warranted for locations that must meet strict turbidity requirements. Some receiving waters may be listed for other parameters of concern for which an ATS might be recommended; however, not all pollutants can be treated with readily available ATS technology.

C.1.2 CGP and LTCGP

An ATS, as covered by the CGP or the LTCGP, is used for the treatment of stormwater discharges generated from precipitation that falls on or runs through the construction area during a rain event. Other water generated from construction operations is considered non-stormwater.

In some cases, ATS designers may wish to include non-stormwater treatment as an aspect of, or supplement to, the ATS system. When doing so, any non-stormwater comingled with stormwater may both alter the performance values of the selected coagulant and place different or additional demands upon the other selected ATS components. These modifications of the system will need to be evaluated and if necessary coverage under a supplemental NPDES Permit, in addition to the CGP or LTCGP, may be required.

C.1.3 General Requirements

The following general requirements are applicable to projects that utilize an ATS:

1. Standard Specification Section 13-8 includes provisions for treating and discharging uncontaminated groundwater and accumulated stormwater from excavations or other areas with a temporary ATS.
2. Submit an ATS Plan to the RE within 20 days of contract approval. The ATS Plan must comply with Standard Specification Section 13-8.01C(2). At least 14 days prior to the planned operation of the ATS, the ATS Plan is required to be submitted electronically to the SWRCB and applicable RWQCB. Each element of the ATS Plan including but not limited to O&M Manual, Monitoring, Sampling & Reporting Plan including QA/QC, Health & Safety Plan, and Spill Prevention Plan must be assessed and evaluated to ensure compliance and functionality with the CGP or LTCGP operational requirements.
3. The design, installation, operation, and monitoring of the temporary ATS and monitoring of the treated effluent must comply with Attachment F of NPDES General Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities (Order No. 2009-0009-DWQ, NPDES No. CAS000002).
4. For a project within the Lake Tahoe Hydrologic Unit, the design, installation, operation, and monitoring of the temporary ATS and monitoring of the treated effluent must comply with Attachment E of the NPDES General Permit for General Waste Discharge Requirements and National Pollutant Discharge Elimination System Permit for Storm Water Discharges Associated with Construction Activity in the Lake Tahoe Hydrologic Unit, counties of Alpine, El Dorado, and Placer, (Order No. R6T-2016-0010, and NPDES No. CAG616002).
5. For a project within the Lake Tahoe Hydrologic Unit, the discharger must perform toxicity testing that complies with Standard Specification Section 13-8.01D(2) if operating a temporary ATS in batch-treatment mode.
6. Training must be provided to each operator of the ATS.
7. The ATS must be designed for the site conditions and anticipated flow rate and must include (1) a treatment system, (2) a collection and conveyance system, and (3) a discharge method and location.
8. The ATS must be capable of capturing and treating within a 72-hour period a volume equal to the runoff from a 10-year, 24-hour rain event using a watershed coefficient of 1.0.
9. The control system must default to recirculation or shutoff during a power failure or catastrophic event.
10. The control system must control the amount of the coagulant to prevent overdosing. The coagulant must be mixed rapidly into the water to insure proper dispersion.
11. Pumps and piping must comply with Standard Specification Section 74-2.
12. Discharges may be made into a sanitary sewer system however; the effluent discharge must comply with the publicly-owned treatment works (POTW) requirements and must meet all criteria as set forth in any issued Batch Discharge Permit. The POTW Batch Discharge Permit should be secured

as part of the ATS planning process to ensure access and feasibility of discharging expected water quantities. This option is frequently utilized for short term or low volume discharges. The Department does not pay for obtaining the municipal batch discharge permit or for discharging the water.

13. Submit documentation for the delivery and removal of ATS components.
14. If observations and measurements confirm that a residual chemical or water quality standard is exceeded, submit the notice of discharge within 24 hours after exceeding the limits per the requirements of the CGP or the LTCGP.
15. Water discharged from a temporary ATS must comply with the Numeric Effluent Limits (NEL) for discharge effluents and the receiving waters.
16. If an NEL is exceeded, notify the RE and submit a Numeric Effluent Limitation Violation Report- ATS Discharge (CEM-2063¹) within 6 hours. For a project in the Lake Tahoe Hydrologic Unit, the Numeric Effluent Limitation Violation Report- Lake Tahoe Hydrologic Unit – Lake Tahoe Hydrologic Unit (CEM-2063T²) must be submitted within 2 hours. The analytical results less than the method detection limits must be reported as less than the method detection limits. In compliance with the CGP or LTCGP, electronic filing of the exceedance report to the SWRCB and RWQCB shall occur within 24 hours of either obtaining the results or identifying the exceedance.
17. Calibrate the flow meter and devices for taking water quality measurements under the manufacturer's instructions as outlined in the ATS Plan.
18. Monitoring equipment must be interfaced with the control system of the ATS to provide shutoff or recirculation whenever effluent readings do not comply with the turbidity and pH limits.
19. Monitoring equipment for the ATS must record data at least once every 15 minutes and cumulative flow data daily. The recording system must have the capacity to record a minimum of 7 days of continuous data.

C.2 ATS Selection Criteria

In general, ATS selection is driven by the available area, and the soil type of the site. Each of these will drive the selection of an ATS that would reliably meet the requirements of the CGP or the LTCGP.

C.2.1 Risk Level

Generally, projects designated as Risk Level 1 under the CGP should implement typical Construction Site BMPs. Project designated as Risk Level 2 or 3 under the CGP should use the following factors to determine whether traditional BMPs are sufficient or an ATS is appropriate for use. The following factors should also be used for projects subject to the LTCGP.

C.2.2 Potential Storage Area and Peak Stormwater Flow

Project sites with enough potential storage area to detain the estimated quantity of stormwater from a rain event and allow sediment to settle out of suspension by gravity may be able to avoid using an ATS. These areas can be used for storage of water with enough detention (dwell) time to settle significant quantities of particles prior to discharge. The minimum detention time can be determined by dividing the available storage by the peak flow expected from a 5 year-24-hour storm. If the minimum detention time of a sedimentation basin can meet the minimum compliance requirements for sedimentation, an ATS is generally not required for turbidity removal. Other considerations that may influence minimum detention time and should be evaluated include, but are not limited to:

¹ This form can be found at: <http://www.dot.ca.gov/hq/construc/forms/CEM2063.pdf>

² This form can be found at: <http://forms.dot.ca.gov/v2Forms/servlet/FormRenderer?frmId=CEM2063T>

- The time required to treat stormwater from successive rain events.
- The quantity of stormwater that may run-on into the project.
- Conditions caused by on-going construction activities.

The above listed conditions are examples that may trigger the need for an ATS.

Determine the area available for potential stormwater storage (A_p). This can include assigned stormwater treatment locations, existing storage areas, or space outside of the construction footprint which is available for use. Often, these areas will necessitate an engineered design and construction specific to the location used, plus a management understanding of detention time commitment and the need to use this dedicated space exclusively for stormwater detention and treatment.

C.2.3 Soil Type

The minimum detention time required for a construction site will depend on the predominant soil type. Fine soils, such as clay, will remain suspended for much longer times than coarser soils, such as sand. To determine the initial minimum detention time required, the composition of the soil within the construction site must be determined. Anticipating and estimating for changing soil conditions from construction activities that affect and change the soil dynamics (e.g., mixing of soil types, compaction, cut/fill areas) may complicate this calculation. Repetitive rain events will also affect the evaluation.

C.2.4 Settling Velocity and Required Settling Area

A calculation of the maximum area for potential treatment must be made. Initially calculate the peak stormwater flow from the site based upon disturbed soil area and the rainfall intensity from a 5 year – 24-hour rain event using the Rational Equation (though this peak flow does not need to be the design flow of a potential ATS). Next, determine the predominant soil type within the construction area. Conservative estimates will use the minimum particle diameter of each soil type (sand, silt, or clay) in conjunction with Stokes Law to determine the settling velocity of the sediment.

Other methods or models may be substituted for Stokes Law if more information is readily available for project soils. Dividing the peak stormwater flow by the settling velocity will determine the minimum area required (A_r) for settling without active treatment. Note that these calculations should take into consideration the changing soil conditions and dynamics based on the phase and stage of the project, scope of soil work being performed, and other issues related to scheduled soil work.

C.2.5 Determine Appropriate Device

Comparing the minimum area required (A_r) to the potential area available (A_p) will determine whether an ATS may be necessary. If the area available is significantly larger (>20 percent) than the area required, evaluate BMPs based upon site characteristics. If the area required is significantly larger than the area available (>20 percent), then an ATS must be considered. If the area available and the area required are similar, only RL 3 sites should consider ATS as they require more reliability than RL 2 sites. If the design can be refined, such as increasing potential storage area or improving the accuracy of the settling velocity calculation, re-evaluate the site. If no other options are available, an ATS is recommended.

The CGP contains direction for implementation of ATS. Risk level 2 projects do not have NELs for pH and turbidity, unless an ATS is used. Therefore, careful evaluation is necessary before selection; check with the District/Regional Design Stormwater Coordinator.

C.3 Factors Affecting Preliminary Design

C.3.1 Pollution Prevention/Sediment Mitigation

Actions to reduce the quantity of sediment in stormwater directed to storage should be implemented in the work area regardless of the decision to use an ATS. With an ATS these measures can lead to more efficient treatment and operational cost savings. Closing off or stabilizing unused portions of the site will reduce the quantity of stormwater that could be impacted by construction activities. Focused consideration should be given to evaluating and installing run-on control and bypass controls means to reduce and minimize the amount of stormwater that would require treatment. Minimizing sheet flow and concentrated flows from up-slope areas and/or drainages coming into the project is critical to reducing not only the quantity of water requiring treatment but also the causative effects of scouring or transport of sediment in run-on water.

To prevent significant sediment loading to an ATS all applicable Construction Site BMPs, especially those that provide erosion and sediment control at the source and within conveyances, should be implemented. If stormwater run-on cannot be prevented from entering the project, installation of lined drainage ditches, bypass piping, or other means, should be considered to direct flows away from disturbed soil areas and steep slopes. This can minimize treatment requirements for run-on. The use of plastic cover is often a significant and beneficial implementation control to prevent direct contact of stormwater with disturbed soil. With plastic cover, the clean run-off can be re-routed, preventing it from entering the ATS collection system.

To minimize stormwater treatment, evaluate and design for the temporary redirection and bypass of roadway runoff to prevent contact with project disturbed soil areas when feasible. If project plans call for the abandonment or removal of existing storm drain conveyances, outfalls, inlets, or lined drainages consider scheduling the work after the rainy season. Considering staging and phasing of project work, evaluate adjustments to the schedule to minimize the removal of existing constructed storm drain systems until the next dry season approaches.

C.3.2 Collection System/Discharge Piping

Collection piping is required to convey the water generated onsite to the treatment system (i.e., the ATS and its component systems). The size and quantity of piping will be determined by the layout and terrain of the disturbed construction area. It may be necessary to include pumps to move large quantities of water across the site. It is also possible for the site to implement multiple ATS systems. Discharge piping and pumps are required to convey treated effluent to the appropriate discharge location. Proper sizing is required to prevent flow backup or sedimentation within the pipe. Some considerations when designing for and installing collection systems include the following:

- Can the stormwater draining toward the ATS collection system be directed through a lined drainage ditch or conveyance piping by which scour will not create additional sediment?
- Can the stormwater draining toward the ATS collection system be filtered by perimeter barriers such as filter lined drainage rock, silt fence, gravel bag check dams, etc., before entering the conveyance?
- Can the conveyance sump (where the pumps are placed) be designed large enough to ensure enough area to handle the run-on water?
- Can the conveyance sumps be designed and situated to prevent direct intake of silt, sediment, or soils? Can filters, screens, or protective barriers be installed that surround the sumps and/or pumps to minimize the up-take of transported heavier fines, particulates or floating materials, vegetative detritus, etc.?
- Can the conveyance pump be so situated by which it can be easily accessed or withdrawn for maintenance or replaced if needed?

- Can the pumps and conveyance piping and/or hose leading to the ATS system from the conveyance sump-pumps be designed to maximize speed of conveyance thereby preventing the sump-pump locations from flooding during peak runoff?

C.3.3 Storage/Pre-Sedimentation

If it is necessary to store large quantities of water onsite during significant rain events, locations such as swales, basins, and other areas conducive for storage may be used to retain water prior to treatment. These locations provide an additional benefit of settling out some sediment before treatment with an ATS. Design of these storage locations should be in accordance with criteria for those BMPs.

Systems with a high sediment loading may necessitate pretreatment. Pretreatment typically consists of a pre-sedimentation basin such as a weir tank for the removal of easily settleable sediment loads. Pretreatment can improve coagulant usage and effectiveness, as well as reduce the quantity of flocculant sludge, thus minimizing costs. Systems with pre-sedimentation and storage can be sized to smaller peak flows as large storms can be stored and treated over longer durations. The trade-off will depend on both the amount of storage and design capacity of the system. Additional considerations related to storage and pre-sedimentation may include:

- Can existing long term excavations, or existing curbed and/or walled in areas be used for temporary storage?
- Can a retention basin be constructed and excavated deep enough (or have above ground walls constructed) to minimize the footprint of the required area needed for holding the estimated maximum quantity of collected stormwater prior to conveyance to the ATS? Are there natural, pre-existing areas in the construction work area where stormwater can be collected for holding prior to conveyance? Can the holding areas be lined to minimize the up-take of resident loose sediment or soils?

C.3.4 Treatment Components

Different components may be used within the ATS. These components interact with each other and need to be considered individually and as an integrated treatment system. Recirculation piping will be necessary to meet turbidity and pH discharge requirements. Table C-1 and C-2 summarize many of the components available for integration into a temporary ATS and associated materials.

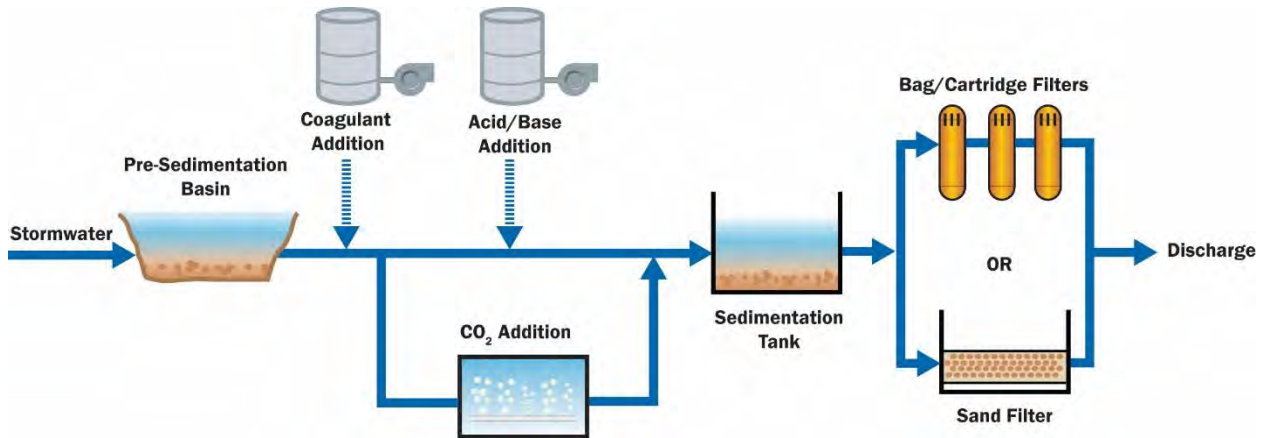

Figure C-1. Potential Treatment Schematic

Table C-1. Potential ATS Components	
Component	Use
Coagulant Dosing Equipment	Chemical for forming floc and removing turbidity
pH Adjustment Dosing Equipment	Chemical for adjusting pH within proper range
Sedimentation Tank (or Basin)	Gravity particulate removal and sludge removal/collection
Bag/Cartridge/Media Filters	Filters for particle removal

C.3.4.1 Coagulation and Flocculation

Different coagulants are available for use within an ATS system. The choice of a coagulant is an important consideration to achieve turbidity removal requirements. The anticipated water quality of the site based on existing soil/sediment conditions and scheduled contractor work will define which coagulants may be effective at forming floc and improving water quality. Coagulant dosing rates and usage will vary depending on the water quality, flow volumes, and coagulant selection. If evaluation and assessment of the performance values and parameters of a coagulant in relationship to the known and expected project conditions is required to achieve treated effluent quality values.

Some coagulants that have been used on past projects include Chitosan, Ferric Chloride, and Alum. Use of other coagulants/polymers may be more difficult for the RWQCB to approve due to uncertainties about potential effects on water quality. Regardless of the coagulant choice, monitoring of residual chemical in the discharge would likely be required.

Equipment such as a chemical feed pump, a rapid mixer (static or mechanical), and sufficient sedimentation will be necessary to properly dose any coagulant. A streaming current detector should be used to monitor and adjust coagulant dose.

A Coagulant-Handling Work Plan is required as part of the ATS Plan and should be prepared for any coagulant used to ensure protection from potentially toxic effects on both human and wildlife due to exposure from high concentrations of residue coagulant. At a minimum, the Coagulant-Handling Plan should include coagulant storage, monitoring, and disposal during the lifespan of the ATS.

When operating the ATS in a Batch Treatment Mode, the CGP requires acute toxicity testing and has specific criteria for testing methodology, laboratory analysis, and quality assurance. All toxicity testing data performed during ATS operation is required to be electronically uploaded to the State Water Boards Storm Water Multi-application and Reporting Tracking System (SMARTS).

Table C-2. Potential ATS Chemicals				
Class of Chemical	Chemical	Advantages	Disadvantages	Approximate Cost
pH Decrease	Hydrochloric Acid (HCl)	Low Dose	Safety Concerns	
	Sulfuric Acid (H ₂ SO ₄)	Low Dose	Safety Concerns	
	Carbon Dioxide (CO ₂)	Inert, Self-Buffering	Mechanically Intensive, Requires Diffuser/Basin	
pH Increase	Sodium Hydroxide (NaOH)	Low Dose	Safety Concerns	
Coagulant	Alum	Lower Cost	Drops pH, Can Require High Dose	
	Ferric (Chloride/Sulfate)	Lower Cost	Drops pH, Can Require High Dose	
	Chitosan	Low Dose	May Not Work Well for Certain Soils	\$2,500 per Tote

C.3.4.2 pH Adjustment

For certain systems, pH adjustment may be necessary to maintain receiving water integrity. Certain site conditions may adversely affect pH and certain coagulant choices can alter pH and should be considered. There are multiple methods for pH adjustment depending on the water quality of the site and each method has inherent strengths and weaknesses dependent upon the condition under which it is used. Each option considered for use should be evaluated for its potential affect upon other aspects and components of the treatment system, both from a physical and chemical perspective. The nature of pH adjustment can not only be highly corrosive to the ATS equipment, but may also present a heightened risk to occupational health of the ATS operator or maintenance technician.

Carbon Dioxide (CO₂) can be used to lower the pH. CO₂ gas is bubbled through water forming carbonic acid (H₂CO₃) and thereby reducing pH. Carbon dioxide is mechanically more intensive, but the gas is much safer to store onsite. The CO₂ system requires a bubble diffuser and a separate basin for proper implementation.

Strong acids and bases may also be used; dosing generally occurs alongside coagulant addition. Dosing rates will vary depending on water quality, receiving water quality, and acid/base selection. Strong acids/bases have safety concerns associated with storage and dosing. In addition, acid/base selection is important to prevent possible interactions with other treatment components. Strong acids (e.g., hydrochloric acid, sulfuric acid) and bases (e.g., sodium hydroxide) would provide rapid pH response for most waters; an advantage to all the acids and bases listed in the table below is that the corresponding counter-ions (e.g., sulfate, chloride, sodium) are not expected to react with constituents in the treatment system. In contrast, some acids (e.g., citric acid) introduce counter ions (citrate) that can have undesirable side-effects, such as promoting bacterial growth or inhibiting floc formation.

Table C-3. Suggested pH Adjustment Chemicals	
Acids	Bases
Carbon Dioxide (CO ₂) – Bubble Carbon Dioxide will form carbonic acid and drop pH	Sodium Hydroxide (NaOH)
Sulfuric Acid (H ₂ SO ₄) – strong acid	
Hydrochloric Acid (HCl)	

C.3.4.3 Sedimentation Tanks

Sedimentation tanks are required to settle floc formed from coagulation. Sedimentation tanks must provide sufficient area and retention time to allow adequate settling of solids. Sedimentation tanks as opposed to weir tanks are recommended for use with high sediment loads. Weir tanks may be used for systems that have minimal influent sediment loading. Higher sediment loads will quickly fill weir tanks and would require sludge removal at higher frequencies compared to sedimentation tanks. Calculating accurate coagulant dosing rates based on site conditions should allow more accurate estimates of sedimentation tank(s) loading of settled floc and therefore lead to selection of the right size tanks. It is important to provide sufficient area for the settling of solids because accumulated floc increases treatment times and therefore reduces the amount of water that can be treated during rain events. In some cases, it may be more desirable to over-estimate the required area.

Figure C-2. Sedimentation Tank

C.3.4.4 Bag/Cartridge/Media Filter

Bag, cartridge, or media filters provide additional particle removal prior to discharge. Bag and cartridge filters pass water through mesh filters reducing particle sizes to a predetermined size. Media filters use sand or other granular media to remove particles. Bag and cartridge filters are removed, changed out and discarded. Media filters use treated water to backwash the filter and remove particles.

It may be necessary to reduce turbidity to approximately 25 NTU or below prior to filtration to prevent excessive buildup on the filter. For bag and cartridge filters, higher turbidity levels passed to the filters will cause increased frequency of change-out and likely increase operational costs. For sand filters, more frequent backwashing will be required which will cause greater work, more chemical usage, and more clean water for backwashing. When backwashing is required the on-going affect upon the treatment process must be calculated into the required treatment rate. When backwashing occurs, less influent is treated in that time.

Figure C-3. Bag/Cartridge Filters

C.3.4.5 Power Sources

An uninterruptible power supply and standby electric generator is recommended for any ATS system. Storms can routinely interrupt power supply systems; thus, it is necessary to provide a backup in such circumstances. An audible or observable alarm should be an aspect of the ATS design to notify personnel in the event of a power outage. Consequences from a non-operable ATS during a critical time may lead to project site flooding and potentially to a discharge with exceedances.

C.3.4.6 SCADA Monitoring Equipment

Supervisory Control and Data Acquisition (SCADA) systems are standard technology used to monitor and control all monitoring and mechanical systems within an ATS. These systems can record and store all relevant data to the project. Remote operation of an ATS is possible through SCADA systems, but connection stability must be maintained to ensure proper operation.

ATS effluent discharges should meet the requirements of the CGP or LTCGP. Monitoring equipment must be installed. These include, but are not limited to, turbidimeter, pH meters, and flow meters. These meters must be calibrated as recommended by the manufacturer or regulator. The frequency of calibration and a documented process to retrieve and verify data should be specified to the contractor and may be required by the RWQCB. In addition, some water quality analysis will be needed to be conducted by outside labs for analysis such as total suspended solids (TSS), settleable solids (SS), or residual chemicals. Validate and maintain the sensors in the in-line ATS system that communicate values to the SCADA system regularly. If these sensors are not functioning properly, the SCADA data may be of limited value. Note: the CGP requires that all field recorded monitoring data including but not limited to turbidity, pH, residual chemical, flow rate, and volume be electronically uploaded every 30 days minimum to the State Water Board.

C.4 Active Treatment System Sizing

The size of the treatment system will be dependent on the acreage of the active disturbed soil area. The system is required to be sized such that the runoff from a 10-year 24-hour rain event would be captured and treated within 72 hours. Storms that are greater than the design event may cause the ATS to exceed the CGP restrictions. In these circumstances, the RWQCB will still expect the contractor to make efforts for meeting the CGP or other requirements.

C.4.1 Construction Area

The area of the basin will be defined by the contributing drainage area of the disturbed construction site. The contributing drainage areas will be defined by the designer depending on the orientation of the construction site. For long or flat construction sites, it may be necessary to subdivide the site and set up separate ATS locations. The conveyance systems required to funnel stormwater to a central ATS location may be prohibitive for certain site orientations.

If multiple receiving waters are present in the site, each receiving water basin may require a separate ATS to maintain watershed integrity. For some receiving waters, BMPs may be sufficient to meet turbidity goals.

C.4.1.1 Flowrate

Peak flowrate can be calculated for each area by the Rational Formula:

$$Q = C \times I \times A \quad (\text{Eqn. 1})$$

Q = Peak Runoff Rate, Cubic Feet per Second

C = Dimensionless Runoff Coefficient (use 1.0)

I = Rainfall intensity, Inches per Hour (10-year, 24-hour)

A = Basin Area, Acres

The rainfall intensity will vary by project location.

Per the Standard Specification Section 13-8, the designer shall use a runoff coefficient value of 1.0.

Basin area is the total contributing drainage area to the BMP or ATS.

C.4.1.2 Sedimentation Residence Time

Hydraulic Retention Time should be between 2 and 4 hours to allow sufficient floc settlement to meet turbidity requirements.

$$\text{HRT} = V/Q \quad (\text{Eqn. 2})$$

HRT = Hydraulic Retention Time, Hours

V = Volume of Sedimentation Basin, Gallons

Q = Flowrate, Gallons per Hour

C.5 Maintenance and Inspection

The ATS requires regular maintenance to ensure it is properly functioning and to prevent leaks. Repair or replace any component of the dewatering equipment that is not functioning properly or as required by the operations and maintenance outlined in the ATS Plan. The detail in the ATS Plan should be of significant nature to clarify most aspects of ATS function and servicing. Each piece of equipment to be used in the ATS needs to be fully described including its purpose and its inter-relationship to the other equipment. Inclusion of manufacturer specification sheets in the ATS Plan is of high value and should be considered. Descriptions of how to assess the ATS components for performance values is instrumental in trouble-shooting deficient operation. A section within the ATS Plan on maintenance scenarios and trouble-shooting examples for commonly known conditions or operational failures is highly recommended. Trouble-shooting questions could include the following:

- Is increased time required because the holding tank is reduced in capacity due to accumulated floc?
- Is increased time required because not enough coagulant is being dosed which could be caused by a degraded sensor?

The inclusion of set procedural steps for bringing on-line each piece of equipment of the ATS system and determinants of how to balance the system is invaluable when attempting to maximize operation or solve a functional problem. These aspects of an ATS Plan, if not considered in the planning stage and left out of the ATS Plan, could lead to failures of the system and on-going repeat deficiencies.

Remove sediment from the storage or treatment cells as necessary to ensure the cells maintain their required water storage and treatment capability. Sediments removed from the uncontaminated areas during maintenance of the treatment system may be dried, distributed uniformly, and stabilized at a location within the project limits where authorized. Generally accumulated floc from treatment, and any associated captured sediment in the system, is disposed of at a landfill permitted to receive such a waste stream.

If observations and measurements determine that the water quality limits are exceeded, immediately stop the discharge, notify the ATS designer, and start corrective measures to change, repair, or replace the equipment and procedures used to treat the water. If a situation occurs in which the operational perimeters of the ATS are exceeded or the criteria for allowed discharges values are compromised, the information must be retained for recordkeeping and reporting purposes. All corrective actions taken including time periods of non-compliance, and/or time periods to institute corrective actions, should be recorded. Record the quantity of discharge that may have been non-compliant. All test reports and records may be included in the report to the RWQCB. If a piece of equipment failed, broke, or an operation process was not followed this information should be noted to allow assessment of reasons for failure and corrective measures to be implemented to prevent a reoccurrence.

After the designer inspects and authorizes your corrective measures, resume treatment and discharge activities under the startup-phase sampling requirements before resuming regular-phase sampling. Ensure that all required recordkeeping and reporting is completed including submittal of Monthly Monitoring Reports and Exceedance Reports, if applicable.

While the ATS is in operation, at a minimum the following must be monitored:

- Influent and effluent turbidity and pH
- Residual chemical
- Effluent flow rate and volume

If treatment is on-going with dosing and injection of chemicals, the retention of recordkeeping data of the monitored pH and turbidity values is critical for the time periods and is required by the CGP. Uploading and saving of the data regularly as an aspect of the SCADA system, with on-going back-up and downloading to retain the monitored information, is recommended. Use of a standard time-period to backup data, such as every 72 hours, is recommended. The ability to perform both assessment and determination of compliance with instantaneous maximum discharge limitations, in addition to daily 24-hour averaging for turbidity values, is only feasible if the monitoring data is captured and available for evaluation.

Field ATS operator visual monitoring of the system readouts is standard operating procedure with physical documentation on daily logs that validate the data read-outs. The retention of data for on-going pH monitoring and discharge is an aspect of the CGP compliance process of recordkeeping. Without this data, the ability to validate adherence to Permit criteria is limited and not easily defensible with the RWQCB.

If the ATS discharges treated effluent, prepare a daily inspection report including monitoring information and submit within 24 hours, or as required. The ATS Plan should describe the information to include in the reports. Prepare a template form to clarify the required report information in advance. Adjust the template accordingly to accommodate changing conditions, when required. The daily inspection report will at a minimum include:

- Discharge volumes
- Water quality monitoring records
- Quantities (generally in gallons) of dosed coagulants in addition to pH chemical adjustment additives
- Significant repair or maintenance performed on the ATS including but not limited to clean-out of tanks or treatment vessels, maintenance or replacement of sensors or electronic monitoring equipment or components, replacement of pipes, pumps, injection devices, etc. It is important to document the process of ATS upkeep to demonstrate due diligence in maximizing the system's operation effectiveness and efficiency. This will be important if the system has an accidental upset, failure, or improper discharge.
- Discharge point information that includes:
 - Date and time
 - Weather conditions, including wind direction and velocity
 - A notation describing if a rain event has been continuous is recommended. If the on-site rain gauge is accessible for measurement, including this information can assist in illustrating the demand for the ATS. NOAA weather report data can validate that the rain event exceeds the design capacity of the ATS therefore clarifying maximization of discharge limitations.
 - Presence or absence of water fowl or aquatic wildlife
 - Color and clarity of the effluent discharge
 - Erosion or ponding downstream of the discharge point
 - This is applicable if not discharging to a storm drain inlet or piped outfall
 - Photographs labeled with the time, date, and location

C.6 Other ATS Considerations

If an ATS will be utilized on a project site for multiple rainy seasons, there are critical elements to both maintaining the ATS and sustaining its operational lifetime including:

- Ensure the ATS designer is experienced in treatment processes and regulatory requirements, and that the assigned operator(s) of the system are required to have demonstrated experience, knowledge, and skills in ATS operation, maintenance, field testing, data recordkeeping, and reporting.
- Selection during planning of equipment and materials that will withstand weather and environmental degradation. For example, choose piping that is UV resistant and sufficiently flexible to withstand some movement, and choose the proper tank such as double lined or walled to minimize breakthrough and leaking.
- Design the ATS layout to minimize movement and or relocation during the lifetime of the project to minimize potential for breakage, misalignment, or disruption of functional operations. This extends to the pre-planning and construction of appropriate collection and conveyance systems based on the staging and phasing of the project. If a substantially sized collection basin is required to hold the stormwater prior to treatment, then the location must be determined beforehand. Commit space for ATS usage during the lifetime of the system and include space to allow access for maintenance and repair.
- If a substantial number of collection sump/pumps will be required to convey the stormwater from multiple locations throughout the project, then the locations, conveyance piping, and drainage ditches must be depicted on plans and must account for scheduled construction work to prevent conflict of alignment. This consideration is to prevent damage to collection apparatus and to ensure stoppage of non-compliant stormwater discharges during critical periods of forecasted rain.

- If a complex ATS is required, ensure that the ATS Plan is critically evaluated for all operational components including engineering, field work, and administrative controls. Securing all requisite water quality data relative to the anticipated treatment scope and planning will be instrumental to the ATS selection and successful operation. Resourcing available technical information from CASQA, or leading industry providers of such systems, will be helpful.
- Dependent upon the project location, site receiving water bodies, discharge locations, and outfalls storm drain systems may not be allowed to receive the ATS treated effluent. Occasionally a point of discharge will be found to be infeasible due to a sensitive receiving water body, local ecological system, or tidally influenced drainage. In this case, a different discharge option must be explored to allow ATS treated effluent disposal.
- Supplemental and extended piping and pumping layouts may be required to convey the effluent to an acceptable location or to facilitate a discharge to a POTW, when feasible. During the planning phase, the discharge limitations and the local conditions must be evaluated. Early confirmation that selected discharge options are acceptable is desirable.

C.7 Treatment Considerations for Non-Stormwater and Groundwater

Most often construction projects require the management and treatment of stormwater. At times, construction projects may be required to consider management and treatment of groundwater and other non-stormwater due to the complexity and scheduling of different types of work. General site factors to consider in determining the most appropriate management or treatment strategy for the project site include but are not limited to project duration, location, size, affected waterbodies or sources, differing drainages and discharge points (natural and manmade), and pertinent historical and environmental protection considerations. A determination of whether water treatment (of any type) should be done together or as a separate treatment process must be made. These issues must be assessed and understood to achieve a successful treatment plan.

Project excavation work or ground disturbing activities may necessitate managing and treating groundwater in addition to managing construction impacted stormwater runoff. Previous fuel leaks, VOC spills, past chemical discharges, or introduction of hazardous contaminants during the construction phase will likely need management and treatment consideration.

A dual use stormwater/non-stormwater treatment system, if feasible, may be designed to treat and discharge the different water sources. Alternatively, separate treatment systems may be designed. When determining which system is most appropriate, consider first the maximum quantity of stormwater verse the maximum quantity of non-stormwater (e.g., groundwater, co-mingled surface water) that must be managed or treated. Consider the complexity of the treatment science that must be applied to achieve permit discharge requirements and to meet receiving water criteria. Consider also available space on the project site. Is there enough room to accommodate the temporary holding and storage of separate water sources during the treatment process? Can the system be designed to work in tandem to treat both water sources at the same time based on different treatment requirements? Is there a demand for separate treatment trains?

Coverage under different NPDES Permits for specific water sources often dictate the approach and desired outcome of treatment including but not limited to sampling, analysis, monitoring, recordkeeping, and reporting. The differing water management and treatment needs may be combined however insightful planning is critical. For example, the treatment of brackish groundwater from structure dewatering verse extracted groundwater polluted by petroleum products is different when compared to each other and when compared to the CGP and/or LTCGP. While the treatment process will be different, the goal of treatment is the same, to achieve an acceptable discharge water quality.

On occasion a project specific NPDES Permit may be issued to address project conditions that require additional water treatment considerations. In most instances, when multiple water sources require management and treatment during project work, a comprehensive evaluation of treatment options will be required. The evaluation should focus on project needs to better understand if a single treatment system designed to operate in an alternative manner would work, or perhaps a dual treatment system designed to achieve separate water quality objectives may be most appropriate for the project. These example considerations are not exhaustive and professional expertise in the decision-making process of water treatment system choice and design is recommended.

Industrial Sites Task Force

Agenda

- Welcome
- Introductions of Task Force Members
- Remarks from Irma Muñoz, Chairwoman of the Los Angeles Regional Quality Control Board
- 5 Minute presentation from each task force members
- Comments and question

LA REGIONAL WATER QUALITY CONTROL BOARD

Compliance Assurance

Stormwater Industrial General Permit & The Upper San Jose Creek Watershed Pilot Project

Background

Stormwater Industrial General Permit

- **Stormwater Industrial General Permit**
 - Adopted in 2014
 - Regulates the discharge of stormwater from industries
 - Defines the types of industries that need coverage
 - Requirements include
 - Monitoring stormwater discharges
 - Implementing Best Management Practices
 - Good Housekeeping Practices
 - Protect activities and equipment from exposure to rain
- Currently 3,441 facilities enrolled

INSPECTION PERFORMANCE

Stormwater FY 15/16 – 16/17

Permit Type	Facilities Regulated	FY 15/16	FY 16/17
		Inspections Completed	Inspections Completed
Const.	1,285	405	413
Indust.	3,088	610	857
Non-Filers			208
Total Inspections		1,015	1,270

Background (cont.)

MS4 Permit

Waste Discharge Requirements For Municipal Separate Storm Sewer System (MS4) Discharges

- 86 Permittees

Part VI.A.2.a requires that Permittees:

- hold dischargers to its MS4 accountable for their contributions of pollutants and flows through ordinances and permits
- use enforcement mechanisms to require compliance
- conduct inspections, surveillance, and monitoring to determine compliance
- require control measures or BMPs be in place and maintained

Background (Cont)

Part VI.D.6 requires that MS4 Permittees:

1. implement an industrial/commercial facilities program designed to prevent discharge from causing a violation of Water Quality Standards
2. maintain a database of all industrial and commercial facilities that are critical sources of storm water pollution
3. notify the owner/operator of each site of the applicable BMPs
4. inspect critical commercial and industrial sources
5. require implementation of source control BMPs
6. use progressive enforcement to ensure facilities comply with storm water requirements

WASTE DISCHARGE REQUIREMENTS FOR MUNICIPAL SEPARATE STORM SEWER SYSTEM (MS4) DISCHARGES WITHIN THE COASTAL WATERSHEDS OF LOS ANGELES COUNTY, EXCEPT THOSE DISCHARGES ORIGINATING FROM THE CITY OF LONG BEACH MS4

Construction Plan Review and Approval Procedures

- I. Each Permittee shall develop procedures to review and approve relevant construction plan documents.
- II. The review procedures shall be developed and implemented such that the following minimum requirements are met:
- (1) Prior to issuing a grading or building permit, each Permittee shall require each operator of a construction activity within its jurisdiction to prepare and submit an ESCP prior to the disturbance of land for the Permittee's review and written approval. The construction site operator shall be prohibited from commencing construction activity prior to receipt of written approval by the Permittee.
 - (2) ES
 - (3) At
 - (4) Th
 - (5) Ea
 - (6) Ea
 - (7) Ea
- document that q
manag
inform
update the ESCP to reflect current conditions, or failing to properly and/or adequately implement the ESCP may result in revocation of grading and/or other permits or other sanctions provided by law."
- (8) Prior to issuing a grading or building permit, each Permittee must verify that the construction site operators have existing coverage under applicable permits, including, but not limited to the State Water Board's Construction General Permit, and State Water Board 401 Water Quality Certification.
 - (9) Each Permittee shall develop and implement a checklist to be used to conduct and document review of each ESCP.

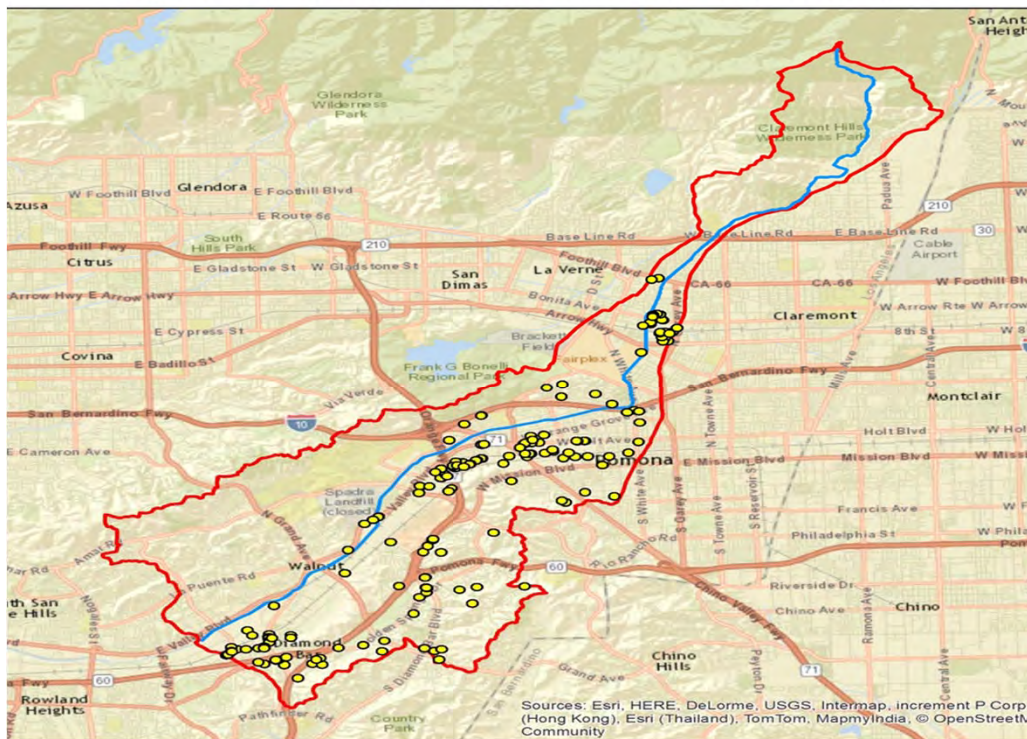

Pilot Project Activities

- Select the watershed
- Send notifications of MS4 audits
- Meet with non government stakeholders
- Identify and inspect potential non-filers**
- Identify and inspect industrial permittees
- Determine each city's compliance with the MS4 Permit**
- Determine the effectiveness of efforts in the watershed through monitoring receiving waters
- Progress Report

Pilot Project Selection

Upper San Jose Creek Sub-Watershed

Creek Sub-watershed — Upper San Jose Creek
 Facilities (213)

- Outfall location
- Manageable for a pilot project: size - 34 square miles. 54 permitted facilities outfall location
- Drains an environmental justice area (Cal Enviro Screen)

Pilot Project Cities:

- Claremont
- Diamond Bar
- Industry
- La Verne
- Pomona
- Walnut
- West Covina
- LA County

Media Filters

Combination BMPs

Coating steel to prevent rusting

Adding filter cloth to structural filters

Industrial Sites Task Force

Vacuum Sweeping

Material Storage

Hazardous Waste Storage

Clarifier Maintenance

Stormwater Treatment

- Collection from yard and consolidation
- Settling
- Treatment Chemistry to encourage settling
- Media filtration, sometimes clay flocc
- Clarifiers
- Turbidity and in-field monitoring

Stormwater Controls

- Facility grading/paving
- Collection sumps
- Underground plumbing
- Filtration System:
 - Retention/settling tanks
 - Chemical treatment
 - Clarifiers
- Media filtration
- Various Non-Structural BMPs

Inspections/Enforcement

- Some cities do annual inspections.
- Enforcement
 - from complaints
 - NGO and private party enforcement.

Costs...

- Vacuum Sweeper: \$40-250K
- Stormwater Filtration System: \$30K-\$1M+
- Paving/Concrete Information:
 - \$ 7.28 for 8" Concrete ☐ \$320K per acre
 - \$ 8.47 for 12" Concrete ☐ \$370K per acre
 - \$ 5.18 for Asphalt 3" over 4" (Asphalt/Base) ☐ \$225K per acre
- Spending money because we have to for compliance and it's a priority, not because a company has so much excess.
- Complying with regulations should be a cost of doing business. Several small yards with zero effort have a bigger impact than one larger yard making 90% effort.

City of Glendora

Councilwoman Judy Nelson

City of Glendora

- 2014 City hired a consulting firm, CWE, to assist with the administration of the industrial/commercial (I/C) facilities program
- CWE performs 2 inspections of each business in 5 years, including follow-up inspections for deficiencies in handling dry weather and stormwater runoff.
- 2nd inspections are currently being conducted August thru October, 2017
- CWE has prepared and distributes an I/C Facilities Program Guidance Manual to inspected business owners.
- Permit compliance is linked to the Business License Process
- Glendora recoups the consultant costs through inspection fees

City Business License Process

The Commercial/Industrial business owner submits for a business license. The business License application is routed to the Building Department.

- For commercial businesses:
 - If there have tenant improvements only:
 - They will receive a building inspection of permanent Best Management Practices (BMPs) and
 - Receive 2 Inspections in 5 years (2012-2017)
 - If it is a new development they will be required to provide:
 - On-site stormwater infiltration
 - A Stormwater Pollution Control Plan including on-site permanent BMP's and
 - will have 2 inspections in 5 years (2012-2017)

Industrial Business Compliance

- Industrial businesses in the city must prove that they have Industrial General Permit (IGP) coverage before they are issued a business license.
- The building department requests a WDID number for coverage under the Industrial General Permit (IGP) or a Non-Exposure Certification (NEC) to determine compliance.

Inspection Fees

The city implemented an inspection fee schedule to cover the cost of the consultant:

Facility Type	Inspection Fee	Follow-Up Fee
Restaurant	\$140	\$150
Automotive	\$240	\$150
Retail Gasoline Outlet	\$230	\$150
Nurseries	\$XXX	\$150
IGP	\$270	\$150
Non-Filers	\$XXX	\$150

Benefits of Compliance

- Educate area businesses on best management practices, stormwater, and local water quality issues.
- Esures that less pollutants are transported to surface water through urban runoff.
- Cities and businesses aren't in jeopardy of receiving fines from the Regional Board or third party lawsuits from environmental groups.

Thank you!

blank for double-sided printing

1.0 INTRODUCTION

The Treatment BMP Technology Report represents part of the California Department of Transportation (the Department) BMP identification, evaluation, and approval process as described in Section 3.3.2 of the Storm Water Management Plan (SWMP) (CTSW-RT-02-008; Caltrans 2003). This report satisfies the requirement for a New Technology Report contained in the State Water Resources Control Board Order No. 99-06-DWQ. This report consolidates information for post-construction technologies in a standardized manner by using a fact sheet format. The BMP fact sheets summarize available design, construction, and performance information. The fact sheets result from a desktop evaluation of BMPs. Usually, a full-scale field evaluation (pilot testing) is required to collect sufficient information to determine if a BMP should be approved and under what conditions (siting constraints). The Department uses the fact sheets as a preliminary screening tool for selection of pilot BMPs when approved BMPs cannot meet project-specific treatment requirements due to siting constraints. BMPs selected for pilot testing are not automatically approved for statewide use. The SWMP includes procedures to (a) identify the need for Pilot BMPs and (b) propose them. Refer to the Caltrans Storm Water Quality Handbook: Project Planning and Design Guide (PPDG) for comprehensive information on this issue (Caltrans 2007).

Department-Approved Treatment BMPs:

- Biofiltration Systems
- Infiltration Devices
- Detention Devices
- Traction Sand Traps
- Dry Weather Flow Diversion
- Gross Solids Removal Devices (GSRDs)
- Media Filters
- Multi-Chambered Treatment Train
- Wet Basins

2.0 PURPOSE OF TREATMENT BMP TECHNOLOGY REPORT

This document is used by the Department to identify and evaluate treatment BMP technologies for potential use in the highway environment only. The Department does not evaluate BMPs for other situations or entities. This document is intended for internal use by the Department. Unless stated otherwise, vendor products discussed in this document are not approved for use by the Department and are not endorsed by Caltrans or the State of California.

3.0 IDENTIFYING AND EVALUATING NEW TECHNOLOGY

The Department prepares fact sheets based on an initial evaluation of identified treatment technologies. The Department may identify technologies in the course of performing reconnaissance studies for specific treatment needs, including non-proprietary BMPs used by other state departments of transportation. To identify proprietary treatment technologies, the Department relies on manufacturers to submit product information. To introduce products to the Department, manufacturers must contact the New Product Coordinator at (916) 227-7073 for submittal instructions. Fact sheets are updated when new information is submitted to the New Product Coordinator before the end of the reporting period (June 30th).

The Department evaluates identified technologies using several criteria (discussed in Section 3.1) and develops fact sheets of the BMPs for this report.

3.1 Evaluation Criteria and Fact Sheet Content

BMP fact sheets are developed using a standard format to facilitate comparison among BMPs. Each fact sheet addresses a standard series of topics, including design, operations, maintenance, construction, treatment, advantages, and constraints. The Department, with input from universities, consultants, regulators, third parties, and manufacturers, continually reviews BMP information reported in literature. Appendix A describes the content of the fact sheets and the evaluation criteria for performance. More detailed information on the Department's current pilot studies resides in the Summary of Reports Prepared for the Monitoring and Research Program (Caltrans 2009).

3.2 Fact Sheet Organization and Treatment BMP Technology Approval

Completed BMP fact sheets are presented in Appendices B and C. Section 4 provides an alphabetical list of all the BMP categories to aid in locating fact sheets for specific types of BMPs.

Appendix B contains fact sheets for BMPs that are not approved by the Department. Favorable evaluations of BMPs can lead to pilot studies to gather cost and performance data. In most cases, a group of similar BMPs are represented on a single fact sheet.

Appendix C contains fact sheets for approved BMPs. Consult the PPDG for more details on the implementation of approved BMPs (Caltrans 2007).

4.0 CATALOG OF TREATMENT BMPS

This alphabetical list includes all BMP technologies. Proprietary BMPs are listed on each fact sheet. The page numbers correspond to the location of the fact sheets in Appendices B and C.

Table 1. List of Treatment BMPS in Appendices

APPENDIX A: BMP FACT SHEET DESCRIPTION AND FORMAT

This appendix describes the content of the fact sheets in Appendices B and C. It also describes evaluation criteria for performance assessments. Each fact sheet is divided into a standard series of topics, which are described below in the order in which they occur in the fact sheets.

A.1 Header Information: BMP Category, Name and Quick Reference Symbols

The left side of the header contains a broad BMP category and more specific subcategory. If necessary, a more specific name is found on the right side. Reference symbols are located in the upper right corner of fact sheets. The symbols and the attributes they represent follow:

Special material handling requirements or potential toxicity

Power is required for this technology

Vector equipment recommended for maintenance

Vector concern because of standing water

A.2 BMP Description

The BMP description provides a summary of the configuration of the BMP and a general overview of the treatment process, how the BMP operates, and considerations that need to be addressed to promote maximum treatment effectiveness and functionality.

A.3 Constituent Removal

This section identifies the constituents expected to be removed by the BMP when present at levels typical of Caltrans stormwater runoff. The groups of constituents examined were previously identified as pollutants of concern (Caltrans 2007).

A.3.1 Constituent Groups

Estimates of the technology's performance removal abilities are made for each of the following constituent groups:

- Sediment (total suspended solids [TSS])
- Total nitrogen

- Total phosphorus
- Pesticides
- Total metals
- Dissolved metals
- Microbiological (including pathogens)
- Litter
- Biochemical oxygen demand (BOD)
- Total dissolved solids (TDS)

A.3.2 Constituent Removal

Unapproved BMPs

The fact sheets for BMPs that are not approved (Appendix B) report whether removal is expected for each of the 10 constituents (or constituent groups) listed in A.3.1. For a given constituent:

- A check mark is used if the removal efficiency is statistically significant or expected to be based on best professional judgment.
- A blank cell is used if there is insufficient data or the removal efficiency is not statistically significant.

Approved BMPs

The fact sheets for approved BMPs (Appendix C) report both constituent removal and level of confidence. The level of confidence reflects the certainty that the reported performance is applicable to typical Caltrans conditioning (e.g., influent concentrations). The level of confidence is based on the quality of monitoring studies. To ensure that data is of the highest quality, stormwater monitoring must be conducted according to scientific procedures, such as those listed in the *Stormwater Monitoring Protocols* (Caltrans 2003a), or equivalent protocols. The level of confidence assessments are defined as:

High: The constituent removal information came from either the Department's research or a study that met the Department's quality assurance and quality control monitoring protocols. Test conditions were typical of the Department's facilities and all of the following criteria were met:

- Full-scale field testing of a stabilized (erosion-free) post-construction transportation-related impervious drainage area
- Sampling and analysis in accordance to the *Guidance Manual: Stormwater Monitoring Protocols* (Caltrans 2003a), or other recognized protocol, such as that required for the International BMP Database (www.bmpdatabase.org)
- Testing at flow rates and volumes typical of Caltrans' drainage areas (areas vary, but usually are between 0.1 and 15 acres. Flow and volumes can be found by using Caltrans' Basin Sizer [www.owp.csus.edu/research/stormwatertools/])

- Mean influent concentrations below the 90th percentile of statewide characterization data (see Table A-1)
- At least eight storm events over a minimum period of two years, but data must also demonstrate a statistically significant removal ($p \leq 0.1$), which may require monitoring additional storm events
- Particle size distribution (PSD) similar to the proposed field conditions (e.g., state whether or not traction sand was applied)
- A mean removal estimate that corroborates the performance claim

Further, the study report must include the following:

- Rainfall record for the study area or its vicinity during the evaluation period
- Operation and maintenance records and costs for the evaluation period

Table A-1. The 90th Percentile Concentrations of Select Constituents.

Constituent	Units	90th percentile*	Constituent	Units	90th percentile*
TDS	mg/L	200	Ammonia nitrogen	mg/L as N	1.4
TSS	mg/L	300	Total Kjeldahl Nitrogen (TKN)	mg/L as N	4.4
Oil & Grease	mg/L	6.6	Nitrate	mg/L as N	2
Copper (dissolved)	µg/L	30	Phosphorus (dissolved)	mg/L as P	0.37
Copper (total)	µg/L	80	Phosphorus (total)	mg/L as P	0.84
Lead (dissolved)	µg/L	7	Orthophosphate	mg/L as P	0.3
Lead (total)	µg/L	100	Diazinon	µg/L	0.4
Zinc (dissolved)	µg/L	140	Diuron	µg/L	11
Zinc (total)	µg/L	400	Glyphosate	µg/L	50
			Pyrene	µg/L	0.96

* 90th percentile is the concentration at which 90% of all measurements are below. These values were estimated from Appendix B of the *Caltrans Discharge Characterization Study Report*, CTSW-RT-06-065 (Caltrans 2003b).

Alternatively, a high score is assigned to infiltration or reuse BMP technologies that provided “no discharge” to surface waters under design conditions. Constituent removal was assumed to be 100 percent removal although it was recognized that certain large storm events would not receive full treatment, and that infiltration may not provide complete removal of constituents for discharge to groundwater or subsequent re-entry to surface waters.

Medium: The criteria for a high level of confidence were not completely met; however, one of the following must apply:

- Statistically significant ($p\text{-value} \leq 0.1$) constituent removal was established from independent stormwater field monitoring for at least one year
- Removal efficiency based on best professional evaluation of unit operations and processes that are well established for treatment of other waters
- Load reduction of nutrients or BOD due to partial infiltration
- Statistically significant ($p\text{-value} \leq 0.1$) constituent removal was established from independent laboratory testing that follows the Technology Assessment Protocol – Ecology (TAPE) from Washington State (ECY 2008), and testing used a volume of water equivalent to one year of runoff for a typical installation. Alternatively, a laboratory loading using actual stormwater could be used as with the Tahoe Small Scale Research Facility (<http://www.dot.ca.gov/hq/env/stormwater/ongoing/tahoe/index.htm>).

Low: There are no available data or available data do not meet the above criteria for medium level of confidence assessment. For example, a manufacturer’s performance claim, without supporting data, would get a low score.

Notes:

This section gives a brief explanation, if necessary, of the logic used to score approved BMP technologies for both removal efficiency and level of confidence.

A.4 Caltrans Evaluation Status [Appendix C Only]

This section documents the BMP’s stage in the evaluation process.

A.5 Schematic

If appropriate, a schematic figure is provided to depict a typical installation, design plan, or a cross-section that identifies major components of the BMP.

A.6 Key Design Elements

This section identifies important design considerations that have been highlighted by vendors or discovered through testing. Ancillary facilities to be used in conjunction with each technology are also listed in this section. An example would be including a detention basin downstream of a chemical treatment technology to capture flocculated particles.

A.7 Advantages and Constraints

These sections list additional advantages and constraints of the BMP that are not covered in the previous sections. Information presented may include impacts from hydrologic characteristics and weather conditions in California, experiences from actual installations, and expansion of particular points discussed in previous sections of the fact sheet.

A.8 Cost Effectiveness Relative to Detention Basins [Appendix C Only]

This section provides an assessment of cost and pollutant removal effectiveness of approved BMPs relative to that for detention basins. Use this section for general comparisons of overall cost effectiveness but not for cost effectiveness comparison for treatment of an individual constituent. Detention basins were chosen because they are common BMPs that have relatively well-established cost and performance information. Relative cost assessments include the cost to build, operate, and maintain each BMP. Two pieces of information are provided on BMP costs:

- General assessment of the BMP’s overall costs compared to detention basins
- Level of confidence in the available data

A.8.1 Cost Effectiveness Assessment

The cost for each BMP was assessed in terms of its 20-year, present worth cost relative to detention basins. The baseline cost of a detention basin is \$673/m³ of water quality volume (1999 dollars), as reported in Appendix D of the *BMP Retrofit Pilot Program* (Caltrans 2004, p. 14-14). The effectiveness of each BMP was also assessed in terms of its overall constituent removal expectations relative to a detention basin. A four-quadrant system was used as a tool to rate each BMP (e.g., ). One of the four quadrants is shaded based on the rating key (see Figure A-1). If the overall constituent removal was greater than that for detention basins, then the BMP was marked as having a greater benefit. Because of a multitude of constituents, this assessment is often based on the best professional judgment rather than on an overall numeric efficiency score.

Benefit	↑	Benefit	↑
Cost	↓	Cost	↑
Benefit	↓	Benefit	↓
Cost	↓	Cost	↑

Figure A-1. Rating Key for Cost Effectiveness.

Due to a lack of cost data for BMPs constructed in the highway environment, the relative cost to detention basins was estimated based on the size and complexity of the technology compared to a detention basin sized for the same drainage area. If annual cost data are available, the 4% discount rate over 20 years results in an annual cost multiplication factor of 13.59. The resulting 20-year, present worth cost is the average annual cost times the 13.59 multiplication factor plus the construction cost. Planning, design, and right-of-way costs are not included.

A.8.2 Level of Confidence

The level of confidence in the costs to build and operate a BMP depends on the type and quantity of information found in the literature. Use of cost information developed for municipal stormwater programs was not considered to be directly relevant to the Department’s facilities.

The right-of-way costs and construction costs of major highway transportation projects are typically much greater than the typical suburban street or arterial road that might be constructed by a municipal public works department. Furthermore, operations and maintenance costs of facilities along major freeways are typically much more expensive than similar municipal facilities because of limited access and the need for traffic control. The level of confidence was assessed in terms of being high, medium, or low. The criteria applied for defining the confidence level of the cost estimates were:

- *High:* Unit cost information was available from a facility constructed by the Department or a similar state's department of transportation.
- *Medium:* Cost information was available from several similar facilities constructed under municipal stormwater programs or conservative costs estimates indicate an obvious unit cost difference compared to a detention basin.
- *Low:* No cost information was available from a similar BMP facility that could be independently verified. Construction costs were extrapolated from available pricing information.

The level of confidence only applies to cost since the level of confidence in the benefit of the BMP is evaluated in the "Constituent Removal" section of the fact sheets.

A.9 Issues and Concerns

This section presents issues and concerns to be considered when evaluating the appropriateness of a BMP for any of the Department's facilities. This information is divided into two categories: maintenance and project development. Within each category is a standard set of topics.

A.9.1 Maintenance Issues

- *Requirements:* Summarizes major maintenance tasks required to keep the BMP functional.
- *Special Training:* Identifies special or unusual training required to perform the maintenance, if applicable.

A.9.2 Project Development Issues

- *Right-of-Way Requirements:* Identifies relative space required to install the BMP.
- *Siting Constraints:* Identifies unique siting considerations and limitations, such as soil types, slope of the land, distance from existing infrastructure or other natural features, power requirements, and regulatory requirements. Common siting constraints, such as maintenance access, are not listed.
- *Construction:* Identifies unique construction precautions and requirements, such as unwanted soil compaction, if applicable.

A.10 Design, Construction, Maintenance, and Cost Sources

This section lists design, construction, maintenance, and cost sources.

A.11 Performance Demonstration Literature Sources [Appendix C Only]

This section provides the references from which performance was evaluated for approved BMPs. It also contains a limited number of additional performance references.

A.12 Certifications, Verifications, or Designations [Appendix C Only]

This section lists the abbreviated names of selected state or federal agencies or cooperatives that issue statements of performance based on third-party review of test results. Agency abbreviations that are used in the fact sheets are defined below, along with a brief explanation of the performance statements typically made by each agency.

TAPE: Technology Assessment Protocol, Ecology

The Washington State Department of Ecology (Ecology) uses TAPE to designate levels of allowed BMP use based on performance. The three designated use levels described below relate to the confidence that Ecology has in a technology's ability to meet various performance goals.

- PULD: The “pilot use level designation” allows limited installations of promising technologies for the purpose of data collections.
- CULD: The “conditional use level designation” allows widespread use within a time period in which testing must be completed to make a determination for GULD.
- GULD: The “general use level designation” indicates that the technology has been proven compliant with TAPE's performance goals.

There are six performance goals that could apply to the designated use level. Brief summaries follow:

- *Basic treatment*: Requires 80% removal of influent TSS between 100 and 200 mg/L and an effluent limit of 20 mg/L for influent TSS less than 100 mg/L.
- *Enhanced treatment or metals treatment*: Requires performance levels to be significantly higher than basic treatment. Influent metals must fall within 0.003 to 0.02 mg/L for dissolved copper and between 0.02 to 0.3 mg/L for dissolved zinc.
- *Phosphorus treatment*: Requires 50% reduction of phosphorus with an influent range of 0.1 to 0.5 mg/L.
- *Oil treatment*: Requires no discharge of visible sheen or of concentrations above 10 mg/L (composite) or 15 mg/L (grab).
- *Pretreatment*: Requires 50% reduction of TSS influent between 100 and 200 mg/L and an effluent limit of 50 mg/L for TSS influent below 100 mg/L.

ETV: Environmental Technology Verification, Environmental Protection Agency

The ETV verifies performance under specific conditions and explicitly states that performance under any other condition may be different. ETV reviews are performed by cooperative agreement with the National Sanitation Foundation (NSF International).

NJCAT: New Jersey Corporation for Advanced Technology

NJCAT provides technical review of field studies and provides performance verification statements. NJCAT works with the Technology Acceptance and Reciprocity Partnership (TARP), which has been endorsed by the states of California, Massachusetts, Maryland, New Jersey, Pennsylvania, and Virginia.

NJDEP: New Jersey Department of Environmental Protection

NJDEP certifies TSS removal based on NJCAT verification reports.

LA RWQCB: Los Angeles Regional Water Quality Control Board

LA RWQCB issues Full Capture Certifications for trash TMDL compliance.

TCEQ: Texas Committee on Environmental Quality

TCEQ approves BMPs that are appropriate for the protection of sole-source groundwater resources.

APPENDIX B: TECHNOLOGY FACT SHEETS

This appendix presents fact sheets for technologies that have *not* been approved by the Department. Evaluation of these technologies is ongoing and may be revised in future reports. The evaluations presented were derived from a review of available information and best professional judgment was used where information was lacking.

BMP Fact Sheet

Bioretention

Description

Bioretention cells consist of vegetated depressions that treat runoff by filtering through mulch and soil-based media. Physical straining, biological and chemical reactions in the mulch, root zone, and soil matrix, and infiltration into the underlying subsoil are the main treatment processes. Bioretention cells reduce peak discharge and runoff volume by detaining water through surface ponding and storage in soil and gravel layers, and by allowing it to infiltrate into the subsoil or dissipate through evapotranspiration.

Constituent Removal

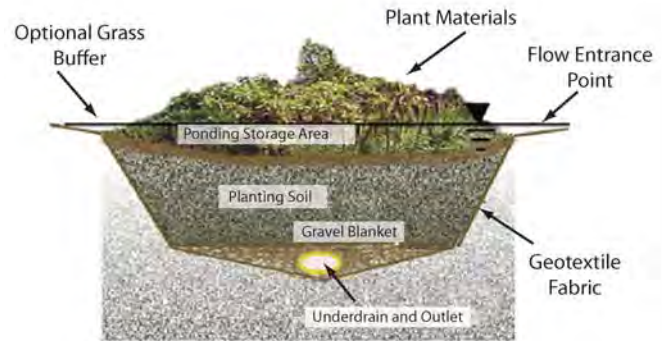

Constituent Group	Removal*
Total Suspended Solids (TSS)	✓
Total Nitrogen	✓
Total Phosphorus	✓
Pesticides	✓
Total Metals	✓
Dissolved Metals	✓
Microbiological	✓
Litter	✓
Biochemical Oxygen Demand (BOD)	✓
Total Dissolved Solids (TDS)	

* Based on performance of conventional bioretention systems or best professional judgment. Blank cells indicate data not available or poor treatment performance. Small bioretention systems operating at relatively high loading rates and/or with shallow media or soil depth may not provide treatment as indicated.

Advantages

- Pollutant removal effectiveness is typically high
- Can provide an aesthetic vegetated appearance
- Reduces peak discharge and runoff volume
- Can fit into narrow right-of-way

Schematic

Source: Maryland Water Resources Research Center

Key Design Elements

- Bioretention area and depth
- Water quality flow
- Ponding depth
- Underground drain system
- Vegetation
- Bioretention media
- Liner, if high seasonal groundwater

Constraints

- In areas with prolonged dry periods, vegetation may require irrigation
- Vegetation may develop slowly in a bioretention facility, though filtering still occurs

BMP Fact Sheet

Bioretention

Maintenance Issues

Requirements:

- Periodic replacement of mulch and planting media
- Maintenance of irrigation system, if used in dry areas

Special Training:

Unknown

Project Development Issues

Right-of-Way Requirements:

Linear biotrench configuration is designed to fit narrow right-of-way

Siting Constraints:

May need irrigation in dry areas, depending on plant selection

Construction:

- Plant establishment period may be required
- Water should bypass until construction is complete and the BMP is stabilized

BMP Fact Sheet

Bioretention

Linear Bioretention Trench

Description

Bioretention cells consist of vegetated depressions that treat runoff by filtering through mulch and soil-based media. Physical straining, biological and chemical reactions in the mulch, root zone, and soil matrix, and infiltration into the underlying subsoil are the main treatment processes. A linear bioretention trench is an adaptation of existing biofiltration designs, consisting of a trench that filters sheet flow runoff through vegetation and a planting soil. It is designed for the narrow right-of-way typical of roadside areas. Removal mechanisms include filtration, infiltration, and plant uptake. Biofiltration strips can be used as pretreatment.

Constituent Removal

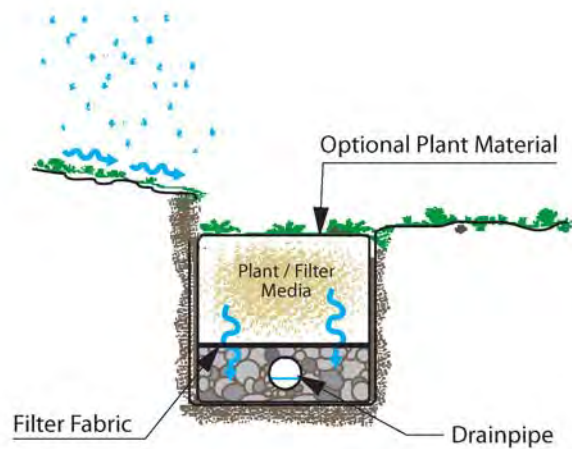

Constituent Group	Removal*
Total Suspended Solids (TSS)	✓
Total Nitrogen	✓
Total Phosphorus	✓
Pesticides	✓
Total Metals	✓
Dissolved Metals	✓
Microbiological	✓
Litter	✓
Biochemical Oxygen Demand (BOD)	✓
Total Dissolved Solids (TDS)	

* Based on performance of conventional bioretention systems or best professional judgment. Blank cells indicate data not available or poor treatment performance.

Advantages

- Fits in a narrow right-of-way
- Pollutant removal effectiveness is typically high
- Can provide an aesthetic vegetated appearance
- Reduces peak discharge and runoff volume

Schematic

Source: Caltrans

Key Design Elements

- Bioretention area and depth
- Water quality flow
- Ponding depth
- Underground drain system
- Vegetation
- Bioretention media
- Liner, if high seasonal groundwater

Constraints

- Vegetation may require irrigation in areas with prolonged dry periods
- Vegetation may develop slowly in a bioretention facility, though filtering still occurs
- If media clogs, resulting standing water may create mosquito habitat
- Avoid high groundwater
- Although narrow, could be a large footprint BMP depending on design constraints
- Maintenance activities may require traffic control

Maintenance Issues

Requirements:

- Periodic replacement of mulch or planting media
- Maintenance of irrigation system, if used in dry areas

Special Training:

Unknown

Project Development Issues

Right-of-Way Requirements:

Designed to fit in a narrow right-of-way

Siting Constraints:

- May need irrigation in dry areas, depending on plant selection
- Minimum head requirement of two feet

Construction:

- Vegetation establishment period may be required
- Water should bypass until construction is complete and the BMP is stabilized

Bioretention

Tree Box Filter

Description

Bioretention cells consist of vegetated depressions that treat runoff by filtering through mulch and soil-based media. Physical straining, biological and chemical reactions in the mulch, root zone, and soil matrix, and infiltration into the underlying subsoil are the main treatment processes. Bioretention cells reduce peak discharge and runoff volume by detaining water through surface ponding and storage in soil and gravel layers, and by allowing it to infiltrate into the subsoil or dissipate through evapotranspiration. Tree box filters are mini bioretention systems that are typically installed along urban sidewalks.

Constituent Removal

BMP Fact Sheet

Detention/Sedimentation

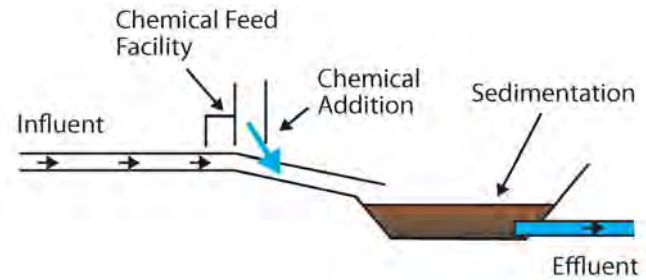

Chemical Treatment

Description

Adding chemical coagulants to stormwater influent can enhance removal of particulates, associated contaminants, and dissolved nutrients in a detention system. Chemical treatment results in floc formation, which increases the settling velocity of particles and improves sedimentation removal efficiencies. The effectiveness of this system largely depends on the type of chemical added, time allowed for sedimentation, and the particle size, density, and settling velocity of the floc that is produced. Typical chemicals used include alum, chitosan, and polyacrylamide (PAM). These chemicals are added either in liquid form upstream of the detention or as a solid (gel block) that is placed in the flow path.

Total Dissolved Solids (TDS)	

* Based on expected improvement over conventional dry detention basin performance. Blank cells indicate data not available or poor treatment performance. Small systems with relatively short detention times may not provide treatment as indicated.

Source: Caltrans

Key Design Elements

- Chemical dose
- Chemical feed and storage facilities
- Chemical mixing facilities
- Capture volume and depth
- Drain time
- Debris screen to protect effluent control
- Maintenance access
- High flow routing

Advantages

- Increases performance of existing detention basins
- The accumulation rate of floc in sediments of quiescent receiving waters can be low due to floc consolidation over time and incorporation of floc into existing sediment
- Chemical treatment can remove nutrients, heavy metals, and fecal coliforms
- Dry alum sludge has chemical characteristics suitable for general land or agricultural application
- Construction costs for stormwater treatment feed systems are largely independent of the drainage area to be treated and depend primarily upon the number of outfalls to be retrofitted

Constraints

- Treated waters may require pH adjustment
- Safety issues related to the chemical storage facility need to be considered
- Alum forms voluminous metal hydroxides that are difficult to dewater
- Appropriate mixing must be provided at the point of chemical addition
- Sludge removal method and frequency need to be considered
- The optimum dose may vary with each storm
- Potential toxicity due to overdosing
- Requires higher level of operator observation than for other BMPs

BMP Fact Sheet

Detention/Sedimentation

Chemical Treatment

Maintenance Issues

Requirements:

- Chemical storage and dosing equipment must be inspected and maintained on a regular basis
- Effluent pH monitoring system must be maintained on a regular basis
- Sludge removal

Special Training:

- Training is required for maintenance of chemical addition and storage system
- Chemical handling

Project Development Issues

Right-of-Way Requirements:

- Small footprint for chemical addition system
- Downstream detention requirement increases footprint
- Other requirements as listed on the Detention Basin fact sheet (see Appendix C)

Siting Constraints:

- May require electrical power supply
- Space for a central housing unit and storage tank
- Need enough head for mixing
- Other requirements as listed on the Detention Basin fact sheet (see Appendix C)

BMP Fact Sheet

Detention/Sedimentation

Electrocoagulation

Description

Electrocoagulation (EC) systems are effective for removal of emulsified oils, total petroleum hydrocarbons (TPH), suspended solids, and heavy metals from exceptionally polluted industrial wastewater and stormwater runoff. EC technology is an alternative to the use of chemical coagulants such as alum, metal salts, or polymers and polyelectrolyte addition(s). The EC process removes pollutants from aqueous media by introducing highly charged metal hydroxide species that neutralize suspended solids and oil droplets and facilitate agglomeration or coagulation. EC treatment is typically followed by sedimentation or filtration processes to remove flocculated material.

Constituent Removal

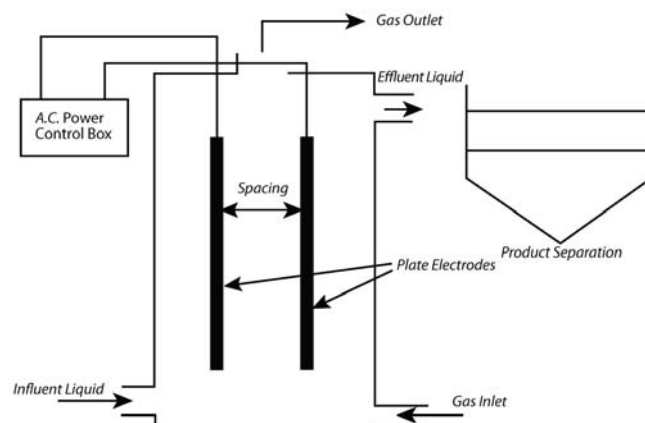

Constituent Group	Removal*
Total Suspended Solids (TSS)	✓
Total Nitrogen	
Total Phosphorus	✓
Pesticides	
Total Metals	✓
Dissolved Metals	
Microbiological	✓
Litter	
Biochemical Oxygen Demand (BOD)	
Total Dissolved Solids (TDS)	

* Based on best professional judgment. Blank cells indicate data not available or poor treatment performance. Actual treatment will depend on a number of variables including current density, conductivity, and pollutant load of influent, as well as the type of electrodes.

Advantages

- Sludge formed by EC tends to be readily settleable and easy to de-water because it is composed mainly of metallic oxides/hydroxides
- Gas bubbles produced during electrolysis can carry the pollutant to the top of the solution where it can be more easily concentrated, collected, and removed
- Electrolytic processes in the EC cell are controlled electrically with no moving parts
- EC may be feasible where electricity is not available if solar panels are used (Note: A 50 gpm EC system requires 480 volt power supply)

Schematic

Source: EPA

Key Design Elements

- Facilities required upstream to capture runoff and provide flood flow routing and bypass
- Mode of operation (batch or continuous)
- Power supply
- Design flow
- Electrical conductivity of influent water
- Sludge storage and disposal
- Need for pretreatment
- Cleaning/replacement needs for electrodes
- Maintenance access

Constraints

- Sacrificial electrodes are dissolved into wastewater streams as a result of oxidation, and need to be regularly replaced
- Use of electricity may be expensive
- Impermeable oxide film may be formed on the cathode leading to loss of efficiency of the EC unit
- High conductivity of the water suspension is required
- Treated waters may have high pH, which may require remediation
- Potential toxicity concerns due to overdosing
- Requires higher level of operator observation than other BMPs

BMP Fact Sheet

Detention/Sedimentation

Permanent Pool

Description

Detention systems provide treatment by detaining runoff to allow settling or sedimentation of particles under gravity. The effectiveness of these systems depends on the time allowed for sedimentation, the particle size, density, and settling velocity, and the extent to which contaminants are associated with the particulate fraction in the incoming water. In addition, systems with permanent pools support plant species that provide constituent removal by biological processes. The primary function of a permanent pool is energy dissipation and assuring a longer residence time for first flush of water. Examples of treatment systems with permanent pools include wet basins/ponds and constructed wetlands.

Constituent Removal

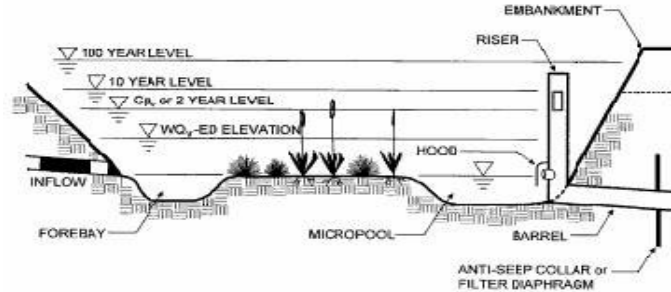

Constituent Group	Removal*
Total Suspended Solids (TSS)	✓
Total Nitrogen	✓
Total Phosphorus	
Pesticides	
Total Metals	✓
Dissolved Metals	✓
Microbiological	✓
Litter	✓
Biochemical Oxygen Demand (BOD)	
Total Dissolved Solids (TDS)	

* Based on conventional wet basin performance. Blank cells indicate data not available or poor treatment performance. Small permanent pool systems operating at relatively high loading rates may not provide treatment as indicated.

Advantages

- Recreational and aesthetic benefits
- Enhances wildlife habitat
- High removal efficiencies for many constituents
- Particularly advantageous to first flush of storms

Schematic

Source: EPA

Key Design Elements

- Capture volume and depth
- Drawdown time
- Permanent pool to capture volume ratio
- Sedimentation forebay
- Vegetation
- Debris screen to protect effluent control
- Maintenance access
- High flow routing
- Liner requirements

Constraints

- Relatively high construction costs in comparison to other BMPs
- Wetland must have a source flow
- Species may restrict maintenance
- There are potential problems associated with mosquitoes
- The device may become a regulated wetland if not consistently maintained on an established schedule
- Wet basins are larger than extended detention basins because of the additional volume of the permanent pool

BMP Fact Sheet

Detention/Sedimentation

Permanent Pool

Maintenance Issues

Requirements:

- Active management of the hydrology and vegetation during the first few years is necessary for plant establishment
- Mosquito fish planting or other vector control methods are needed
- Vegetation thinning or removal may be necessary for vector control, wildlife may limit activities to a particular season
- Sensitive species inspections
- Sediment removal (hand removal has been found to be more cost-effective than mechanical removal)
- Removing standing water for the dry season may be required if not augmented by dry weather flow

Special Training:

Unknown

Project Development Issues

Right-of-Way Requirements:

Space requirements are high for wet basins. The volume of the permanent pool should be at least three times the water quality volume

Siting Constraints:

- Soil should have a low infiltration rate or basin should be lined with a clay or geotextile liner so that water level is maintained in the basin
- Wet basins should be sited where a permanent pool of water can be maintained during the wet season
- Requires a minimum ten-foot separation between seasonal high groundwater and basin invert if a liner is not used

Construction:

- Plant establishment period is recommended
- Excavated soil surface should be suitable to support plant life
- If a pond liner is used, it must be carefully installed and maintained to avoid punctures

Detention/Sedimentation

Permanent Pool

Description

Detention systems provide treatment by detaining runoff to allow settling of particles under gravity. The effectiveness of these systems depends on the time allowed for settling, the particle size, density, and settling velocity, and the extent to which contaminants are associated with the particulate fraction in the incoming water. In addition, systems with permanent pools support plant species that provide constituent removal by biological processes. The Vegetated Rock Filter (also called Subsurface Wetland) consists of a sealed, shallow basin or channel filled with substrate media and emergent aquatic plants. The substrate, typically gravel, rock, or other material, provides support for plant and algae. Treatment is primarily accomplished via settling, biological uptake by plants, and microbial breakdown. An alternative to a basin configuration is a linear trench configuration which is more suitable for roadside application.

Constituent Removal

Constituent Group	Removal*
Total Suspended Solids (TSS)	✓
Total Nitrogen	✓
Total Phosphorus	
Pesticides	
Total Metals	✓
Dissolved Metals	✓
Microbiological	✓
Litter	✓
Biochemical Oxygen Demand (BOD)	
Total Dissolved Solids (TDS)	

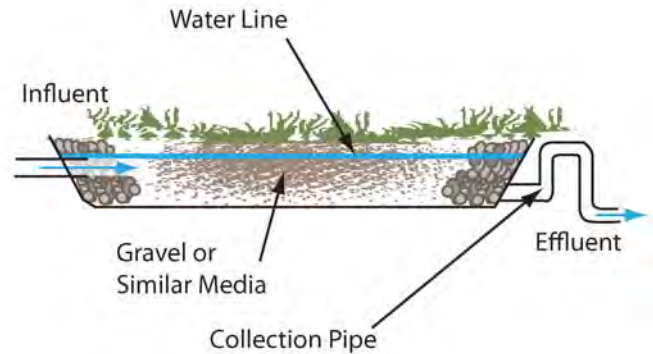

* Based on conventional wet basin performance. Blank cells indicate data not available or poor treatment performance.

Advantages

- Enhances aesthetics and wildlife habitat
- High removal efficiencies for many constituents
- Particularly advantageous to first flush of storms
- Minimal vector concerns because permanent water level is below the surface

Vegetated Rock Filter

Schematic

Source: Caltrans

Key Design Elements

- High flow routing
- Media type and depth
- Liner requirements
- Forebay or other pretreatment method
- Permanent pool to capture volume ratio
- Maintenance access

Constraints

- Relatively high construction costs compared to other BMPs
- Must have a continuous source flow to maintain plant community
- Wildlife may restrict maintenance
- May become a regulated wetland if not consistently maintained on an established schedule
- Larger than an extended detention basin because of the additional volume of the permanent pool
- Requires long-term maintenance to remove metals and persistent organics that accumulate in sediments
- Anaerobic conditions may increase biological availability of some metals (e.g. methyl mercury)

BMP Fact Sheet

Detention/Sedimentation

Permanent Pool

Vegetated Rock Filter

Maintenance Issues

Requirements:

- Active management of the hydrology and vegetation during the first few years is necessary for plant establishment
- Vegetation thinning or removal may be necessary, but wildlife may limit such activities to a particular season
- Sensitive species inspections
- Inspect the gravel bed annually for sediment build-up. Remove sediment periodically
- Check inlet and outlet devices for clogging during the rainy season

Special Training:

Unknown

Project Development Issues

Right-of-Way Requirements:

Space requirements are high because of the volume of the permanent pool

Siting Constraints:

- Located on sites with less than two percent slope
- Soil should have a low infiltration rate or basin should be lined with a clay or geotextile liner so that water level is maintained in the basin
- Site where a permanent pool of water can be maintained
- Requires a minimum ten-foot separation between seasonal high groundwater and basin invert if a liner is not used

Construction:

- Plant establishment period is recommended
- Media surface should be suitable to support plant life
- If a pond liner is used, it must be carefully installed and maintained to avoid punctures

BMP Fact Sheet

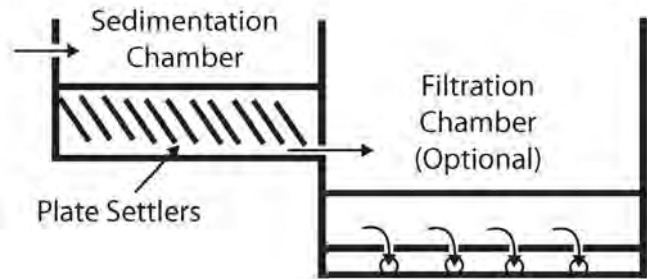

Detention/Sedimentation

Plate and Tube Settlers

Description

Plate and tube settlers typically consist of parallel plates or inclined tubes that permit solids to reach the plate or tube after only short distances of settling. This reduction in the distance particles must travel increases the rate of sedimentation. The effectiveness of these systems depends on the time allowed for sedimentation (controlled by the effective overflow rate), the particle size, density, and settling velocity, and the extent to which contaminants are associated with the particulate fraction in the incoming water. Sedimentation in the first chamber of an Austin sand filter or in a concrete detention basin can be improved by installing a plate or tube settler.

Schematic

Biochemical Oxygen Demand (BOD)	
Total Dissolved Solids (TDS)	

* Based on conventional dry detention basin performance. Blank cells indicate data not available or poor treatment performance. Small plate and tube settlers operating at very high overflow rates may not provide treatment as indicated.

Source: Caltrans

Key Design Elements

- Effective overflow rate
- Size and mounting of plates or tubes
- Sludge collection and removal facilities
- Pretreatment for litter
- Maintenance access
- High flow routing

Advantages

- Enhances particle removal of detention/sedimentation BMPs
- May reduce footprint of a detention/sedimentation BMP or Austin sand filter when used as pretreatment
- May decrease maintenance frequency of downstream filters

Constraints

- Maintenance is more difficult than in an open basin. May require confined space entry and hand cleaning of tubes or plates
- Water must be introduced so that it flows uniformly through the settlers
- Settled particulates can be resuspended if critical velocity is exceeded
- Requires litter removal before passing water through tubes or plates
- Other constraints as listed on the Detention Basin fact sheet (see Appendix C)

BMP Fact Sheet

Detention/Sedimentation

Plate and Tube Settlers

Maintenance Issues

Requirements:

- Cleaning and maintenance of the plate or tube settlers may require removal of the settler structure
- May require hand cleaning of tubes or plates
- Litter may get trapped in the settler structure

Special Training:

Training may be required for confined space entry

Project Development Issues

Right-of-Way Requirements:

Reduces right-of-way requirements for a detention basin or Austin sand filter when used as pretreatment

Siting Constraints:

Similar to siting constraints for a detention basin or Austin sand filter (see Appendix C)

Construction:

None identified

Microbiological	
Litter	✓
Biochemical Oxygen Demand (BOD)	
Total Dissolved Solids (TDS)	

* Based on conventional dry detention basin performance. Blank cells indicate data not available or poor treatment performance. Small systems with relatively short detention times may not provide treatment as indicated.

Advantages

- Relatively easy to operate and maintain
- Potential for substantial infiltration
- Can be sited more easily than Austin sand filters

Schematic

Source: Caltrans

Key Design Elements

- Capture volume and depth
- Drain time
- Debris screen to protect effluent control
- Maintenance access
- High flow routing

Constraints

- Limited pollutant removal for fine particles, nutrients, and dissolved constituents
- Can only be placed in areas with sufficient hydraulic head
- If outlet clogs, resulting standing water may create mosquito habitat
- May require confined space entry for below grade storage
- May require liner in areas with high seasonal groundwater

BMP Fact Sheet

Detention/Sedimentation

Temporary Pool

Maintenance Issues

Requirements:

- Regular inspections for standing water, side slope stability, debris and sediment accumulation, and vegetative cover
- If vegetative cover is not established to acceptable thresholds, re-seeding or erosion control measures may need to be implemented
- Sediment removal

Special Training:

Training for confined space entry for below ground facilities

Project Development Issues

Right-of-Way Requirements:

Space requirements are relatively high

Siting Constraints:

- Site where there is sufficient hydraulic head to facilitate complete drainage
- Requires separation between seasonal high groundwater and basin invert if liner not used

Construction:

Minimize compaction of underlying soils to maintain infiltration capacity

Hold and Release

Description

Detention systems provide treatment by detaining runoff to allow settling or sedimentation of particles under gravity. The effectiveness of these systems depends on the time allowed for sedimentation, the particle size, density, and settling velocity, and the extent to which contaminants are associated with the particulate fraction in the incoming water. Hold and release valves located on the outlet of the detention basin are used to provide a consistent detention time for a variety of storm sizes. Valves can be powered electrically or pneumatically. The timing of valve operations is adjusted by a logic controller and water depth sensors. Hold and release valves can also be used for infiltration basins in poorly infiltrating soils because they allow water that does not infiltrate to drain.

Schematic

Total Suspended Solids (TSS)	✓
Total Nitrogen	✓
Total Phosphorus	✓
Pesticides	
Total Metals	✓
Dissolved Metals	
Microbiological	
Litter	✓
Biochemical Oxygen Demand (BOD)	
Total Dissolved Solids (TDS)	

* Based on field test results by Middleton and Barrett (2006) and removals observed for conventional dry detention basins. Blank cells indicate data not available or poor treatment performance.

Advantages

- Treatment for TSS and total metals is comparable to sand filtration, but with lower footprint and head requirements
- Increased infiltration potential compared to conventional detention basins

Source: Caltrans

Key Design Elements

- Valve type and size
- Power and controls system for operating outlet bladder or valve
- Maintenance access

Constraints

- Reliability unknown
- Electric valves require power supply
- Pneumatic valves require high pressure gas source
- Orifice clogging may cause standing water, resulting in mosquito habitat
- Requires inspection and maintenance of hold and release valves, controller, and power supply

Detention/Sedimentation

Temporary Pool

Description

Detention systems provide treatment by detaining runoff to allow settling of particles under gravity. The effectiveness of these systems depends on the time allowed for settling, the particle size, density, and settling velocity, and the extent to which contaminants are associated with the particulate fraction in the incoming water. Treatment systems with temporary pools, which are normally dry between events, include above ground dry detention ponds/basins and below grade temporary storage. Infiltration chambers is a concept developed by Caltrans to increase infiltration in conventional BMPs. The addition of infiltration chambers below the invert of earthen detention systems is expected to capture and infiltrate the first flush of stormwater runoff. These infiltration chambers can consist of gravel, high porosity storage media with a sand overlay, or native soil that has been amended to improve infiltration. In soils that infiltrate well, raising the riser orifice may provide the same treatment benefit as the installation of infiltration chambers.

Detention/Sedimentation

Temporary Pool

Skimmer

Description

Detention systems provide treatment by detaining runoff to allow settling or sedimentation of particles under gravity. The effectiveness of these systems depends on the time allowed for sedimentation, the particle size, density, and settling velocity, and the extent to which contaminants are associated with the particulate fraction in the incoming water. Treatment systems with temporary pools, which are normally dry between events, include above ground dry detention ponds/basins and below grade storage. A skimmer drains water from just below the water's surface in a detention basin to improve sedimentation. Captured water is decanted to create a longer flow path compared to basins that drain from the invert.

Total Phosphorus	✓
Pesticides	
Total Metals	✓
Dissolved Metals	
Microbiological	
Litter	✓
Biochemical Oxygen Demand (BOD)	
Total Dissolved Solids (TDS)	

* Based on conventional dry detention basin performance. Blank cells indicate data not available or poor treatment performance.

Advantages

- Potentially increased removal of suspended solids
- Can retain free oil and grease because clarified water is decanted from just below the water's surface

Schematic

Source: Caltrans

Key Design Elements

- Means of removing water when skimmer is at its lowest position
- Orifice sizing of the skimmer
- Durability of materials used to construct skimmer
- Maintenance access

Constraints

- Limited pollutant removal for fine particles and dissolved constituents
- Secondary outlet may be required to drain water completely
- Prone to clogging by vegetation
- If clogged, resulting standing water can create mosquito habitat
- Frequent inspections may be required

BMP Fact Sheet

Detention/Sedimentation

Disinfection

Chemical Treatment

Description

Chemical disinfection of stormwater can be achieved by the addition of a liquid (e.g., hypochlorous acid solution) or a gas (e.g., ozone). The basic treatment system consists of a chemical generation/storage system, a contact chamber, and a quenching chamber to remove residual chemical. For many years, chemical disinfection systems have been used successfully for inactivating pathogens and other microbial contaminants in drinking water and wastewater. For intermittent wet weather flow, a pretreatment device and an equalization/storage basin may be required.

Advantages

- Specific use guidelines available
- Proven effectiveness on microbial contaminants
- Mosquitoes are not an issue with chlorinated water
- Ozone is a strong disinfectant and has a limited number of by-products
- Low doses are required to complete disinfection
- Low residual ozone concentration in the treated effluent, minimizing impact on receiving waters
- Although ozone systems are complex, use of instrumentation makes the process automated and reliable

Schematic

Source: UN Food and Agricultural Organization

Key Design Elements

- Chemical dose and contact time
- Chemical feed and storage facilities
- Mixing facilities
- Pretreatment to remove particles is required to achieve reliable disinfection
- Contact time must be provided in a contact basin or sedimentation basin downstream
- Quenching system may be required

Constraints

- Declorination may be required to prevent harmful effects to receiving waters
- Pretreatment (e.g., removal of suspended solids, and oil and grease) required
- Requires special handling procedures and chemical storage tank on site
- Some organics may be converted to other (possibly more harmful) products
- Ozone must be produced on site because it cannot be stored
- Ozonation technology has a very high energy requirement
- Some ozonation by-products may be harmful to the receiving water
- Ozone escaping to the atmosphere may contribute to air pollution problems
- Ozone diffusers can be damaged easily by debris and sediments

BMP Fact Sheet

Disinfection

Chemical Treatment

Maintenance Issues

Requirements:

- Mechanical equipment must be maintained
- Chemicals must be replenished
- Chemical concentration must be monitored
- Check generators daily when in operation
- Manual start-up of the ozone generator is preferable because it needs to be purged before each start-up

Special Training:

- Needed for special materials handling
- Needed for inspection and maintenance of the chemical dosing system, mixing chamber, and other design elements
- Needed for operation and maintenance of gas feed system, ozone generator, and contact chamber

Project Development Issues

Right-of-Way Requirements:

- Space requirements will depend on size of contact chamber needed to accommodate design flow
- Pretreatment space required for sedimentation, filtration, and equalization of design flow

Siting Constraints:

- Restricted to sites with available power

Construction:

- Avoid sediments in the contact chamber during construction
- May have start-up and testing requirements

Disinfection

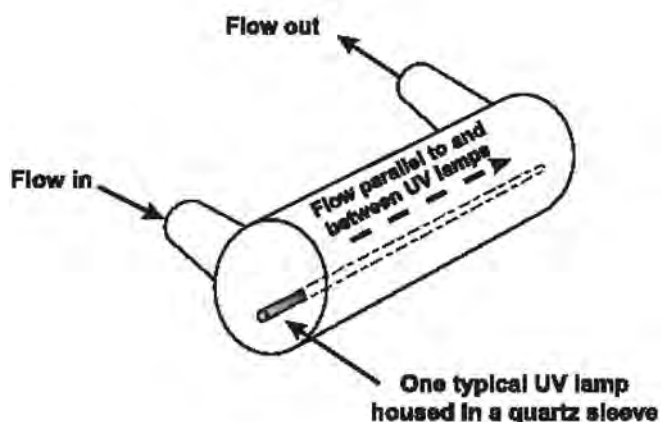

Ultraviolet

Description

Ultraviolet (UV) light disinfects water by altering the genetic material (i.e., DNA) in the cells of bacteria, viruses, and other microorganisms so that they can no longer reproduce or infect. In UV disinfection systems, the light is produced by germicidal lamps enclosed in a pressure vessel or submerged in a water channel. As the water flows past the UV lamps, the microorganisms are exposed to a lethal dose of UV energy. The UV dose is the product of the light intensity and contact time. The UV disinfection treatment is downstream of pretreatment BMPs, such as a Multiple Chamber Treatment Train (MCTT) or a media filter.

* Based on performance for dry weather flow treatment (City of Santa Monica). Blank cells indicate data not available or poor treatment performance. Small disinfection systems operating at relatively high flow rates may not provide treatment as indicated.

Source: EPA

Key Design Elements

- Light intensity and contact time
- Hydraulic system for moving water past lamps
- Facilities for cleaning lamps
- Pretreatment to remove particles is required to achieve reliable disinfection

Advantages

- Natural process that disinfects without chemicals and has low maintenance requirements
- Automated operations and controls
- Compact system with a small footprint compared to other disinfection technologies
- Suitable for retrofit to existing BMPs
- No impact on other processes following UV treatment
- No chemical residual, minimizing impact to receiving waters

Constraints

- Pretreatment requirement may be substantial
- Clumping microorganisms can impact disinfection by harboring pathogens in the aggregates
- Specific design parameters vary for individual waters (UV transmittance)
- Under certain conditions, some organisms are capable of repairing damaged DNA and reverting back to an active state to reproduce (photoreactivation). This can be minimized by shielding the process stream or limiting the exposure of disinfected water to sunlight immediately following disinfection
- Organic and inorganic fouling usually occurs on UV lamp sleeves. Inorganic fouling, which is related to high lamp temperature, is the most difficult to clean because inorganics, such as iron and manganese, bind to the quartz sleeve

BMP Fact Sheet

Disinfection

Ultraviolet

Maintenance Issues

Requirements:

- Each lamp must be cleaned periodically-typically every two weeks for wastewater discharges, but probably less frequently for intermittent stormwater discharges
- Lamps have a short life span and may require frequent replacement
- Pumps must be maintained

Special Training:

Trained staff is required for mechanical equipment maintenance

Project Development Issues

Right-of-Way Requirements:

May be compact, but pretreatment space requirement may be large

Siting Constraints:

- Restricted to sites with power available nearby
- Requires a volume-capture BMP to provide flow control

Construction:

Significant start-up and testing requirements

Drain Inlet Insert

Baffle Box

Description

Drain inlet inserts, also known as catch basin or curb inlet inserts, are used to remove pollutants at the point of entry to the storm drain system. The effectiveness of drain inlet inserts depends on their design and on the frequency of maintenance to remove accumulated litter and sediment. Baffle type inserts utilize a series of baffles to force water to flow upwards before it is discharged, resulting in sedimentation of larger particles within the insert. Some inserts are designed to drop directly into existing drain inlets, while others may require attachment to drain inlet walls.

Constituent Removal

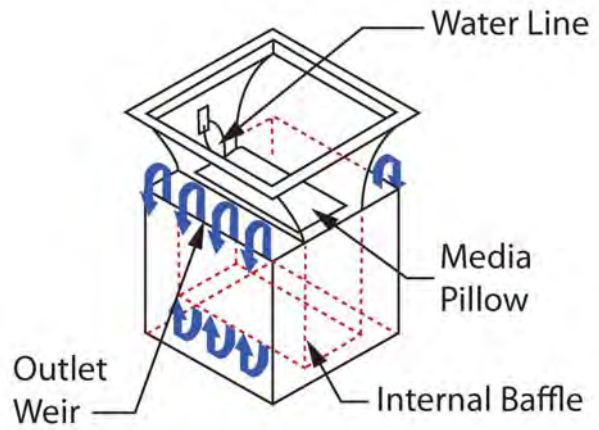

Constituent Group	Removal*
Total Suspended Solids (TSS)	✓
Total Nitrogen	
Total Phosphorus	
Pesticides	
Total Metals

Microbiological	
Litter	✓
Biochemical Oxygen Demand (BOD)	
Total Dissolved Solids (TDS)	

* Based on best professional judgment. Blank cells indicate data not available or poor treatment performance. Some inserts may not provide treatment depending on size, configuration, and baffle specifications.

Advantages

- Range of sizes can be retrofitted to storm drain requirements
- The device can be installed relatively easily in new and existing facilities without structural modification
- Suitable for areas with low volume traffic, such as Park and Ride lots

Schematic

Source: Caltrans

Key Design Elements

- Hydraulic capacity and pollutant storage capacity
- Provision for overflow or bypass

Constraints

- Standing water of some products may create mosquito habitat
- A Caltrans study (2004) discourages the use of drain inlet inserts along highway drain inlets due to safety considerations
- High flows may flush accumulated material
- Capacity (size of basket) is constrained by the size of the drain inlet to be retrofitted
- May require frequent monitoring and maintenance because of limited capacity
- Maintenance activities may require traffic control if the device is installed along the traveled way

BMP Fact Sheet

Drain Inlet Insert

Basket/Box

Baffled Filtration Box

Description

Drain inlet inserts, also known as catch basin or curb inlet inserts, are used to remove pollutants at the point of entry to the storm drain system. The effectiveness of drain inlet inserts depends on their design and on the frequency of maintenance to remove accumulated litter and sediment. The baffled filtration box is a non-proprietary open-bottom filtration drain inlet insert that is designed to optimize sedimentation, filtration, and adsorption. A curved baffle directs flows into a filter bag made of a non-woven geotextile fabric. Surface filtration occurs as water flows through the geotextile. Sedimentation occurs as water flow exceeds the capacity of the fabric bag and spills over the sides. Water flowing through the fabric and overtopping the bag is further filtered by an arrangement of fabric and media at the bottom of the insert. Adsorption of different pollutants varies according to the media used. Overflow is allowed through bypass slots below the inlet.

Drain Inlet Insert

Basket/Box

Description

Drain inlet inserts, also known as catch basin or curb inlet inserts, are used to remove pollutants at the point of entry to the storm drain system. The effectiveness of drain inlet inserts depends on their design and on the frequency of maintenance to remove accumulated litter and sediment. The GSR Basket is a non-proprietary concept developed by Caltrans that is similar to other basket inserts that rest on the sidewalls of standard drain inlets. This insert has an integrated drop inlet grate, and a unique design that allows for automated removal of the entire basket by mechanisms similar to those used by garbage trucks. Flood flow bypass would occur by overflowing the basket.

BMP Fact Sheet

Filtration

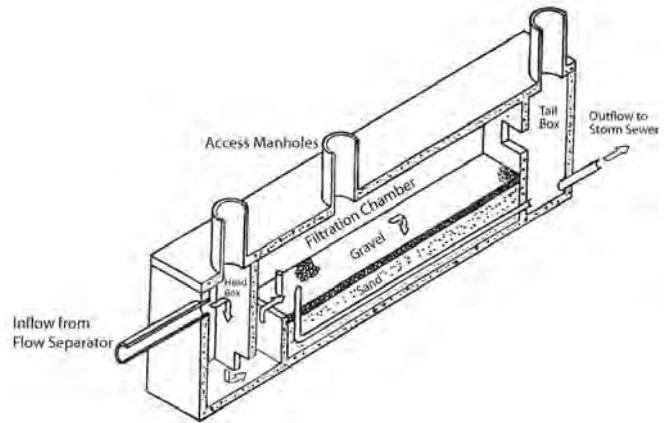

Bed

Description

Filtration systems provide treatment by filtering out or straining particles and associated pollutants in the stormwater. In bed filters, stormwater flows through one or more layers of open-bed granular media before discharging through an underdrain system. The media can be inert, such as sand or gravel, or adsorptive, such as peat or a manufactured media. The effectiveness of the system depends on the loading rate on the filter, the type, size and porosity of the media, and the type and size distribution of the particles in the incoming stormwater. If the media is adsorptive, the water chemistry will also determine the effectiveness of the filter in removing dissolved constituents. Pretreatment may be necessary prior to filtration to prevent clogging and premature failure of the media.

Source: EPA

Key Design Elements

- Flood flow routing and bypass
- Water quality design flow
- Media type, grain size, and area
- Pollutant storage capacity
- Need for pretreatment
- Maintenance access

Advantages

- Typically smaller than basin type BMPs
- Can be installed below grade
- Media can be selected to target specific constituents of concern

Constraints

- Media may be proprietary
- A permanent pool of water in the treatment vault of some configurations can provide mosquito breeding opportunities
- No infiltration and volume reduction, when constructed within a concrete vault
- Confined space entry
- Entry needs to be kept accessible
- Footprint increased if pretreatment required

BMP Fact Sheet

Filtration

Bed

Maintenance Issues

Requirements:

- Routine maintenance may include periodic sediment and debris removal as well as spent media replacement. Layered media may complicate maintenance
- Vector control or abatement may be required

Special Training:

- Requires training for media maintenance/replacement
- May require confined space entry training

Project Development Issues

Right-of-Way Requirements:

Space requirements depend on sizing criteria, typically smaller than for basins

Siting Constraints:

Head requirements for gravity drain

Construction:

None identified

Filtration

Bed

Description

Filtration systems provide treatment by filtering out or straining particles and associated pollutants in the stormwater. In bed filters, stormwater flows through one or more layers of open-bed granular media before discharging through an underdrain system. The effectiveness of the system depends on the loading rate on the filter, the type, size and porosity of the media, and the type and size distribution of the particles in the incoming stormwater. Conventional Austin Filters can be augmented with a layer of alternative media, such as an adsorptive manufactured media that removes fine particles and dissolved constituents. Alternative media tested by Caltrans includes activated alumina, iron-modified activated alumina, and limestone. A top layer of sand can reduce life-cycle costs because capturing particles on the sand layer prolongs the adsorptive life of the more expensive underlying media.

Microbiological	
Litter	✓
Biochemical Oxygen Demand (BOD)	
Total Dissolved Solids (TDS)	

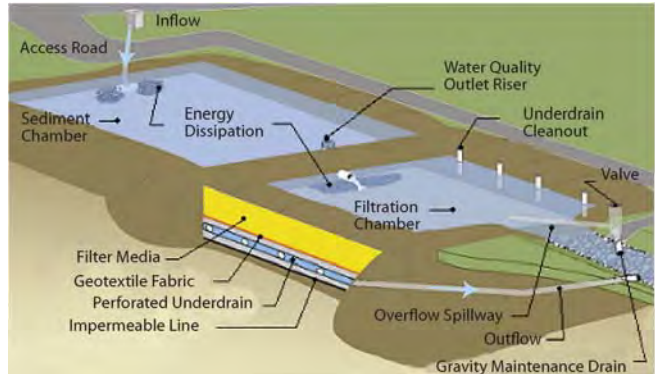

* Based on the ongoing Highway 50 Activated Alumina Media Filter Pilot Study (Caltrans 2007) and best professional judgment. Blank cells indicate data not available or poor treatment performance.

Advantages

Effective constituent removal for suspended solids, fine particles, and total and dissolved phosphorus

Austin Filter with Alternative Media

Schematic

Source: Caltrans

Key Design Elements

- Flood flow routing and bypass
- Media grain size, area, and depth
- Outlet orifice plate to control media contact time
- Maintenance access

Constraints

- Media may be proprietary
- If media clogs, resulting standing water may create mosquito habitat
- No infiltration and volume reduction when constructed within a concrete vault
- Media may need to be washed to avoid substantial pH changes and metals leaching
- Effluent may require monitoring during first year for elevated pH and dissolved metals

Filtration

Bed

Austin Filter with Alternative Media

Maintenance Issues

Requirements:

- Routine maintenance may include periodic sediment and debris removal as well as spent media replacement. Layered media may complicate maintenance
- Vector control or abatement may be required

Special Training:

Training is required for media handling, removal, and replacement

Project Development Issues

Right-of-Way Requirements:

Space requirements are similar to an Austin Sand Filter

Siting Constraints:

- Head requirement of about four feet
- Avoid locations with base flow because of clogging due to algae growth

Construction:

If exposed to construction site runoff, remove and replace media after drainage area has been completely stabilized

Filtration

Bed

DC Sand Filter

Description

Filtration systems provide treatment by filtering out or straining particles and associated pollutants in the stormwater. In bed filters, stormwater flows through one or more layers of open-bed granular media before discharging through an underdrain system. The effectiveness of the system depends on the loading rate on the filter, the type, size and porosity of the media, and the type and size distribution of the particles in the incoming stormwater. DC Sand Filters are typically designed to handle runoff from completely impervious drainage areas of 0.4 hectares (1 acre) or less. This filter design incorporates three chambers. Runoff flows through a sedimentation chamber before it enters a filter chamber where it passes through an open sand bed. Filtered water is collected in a gravel underdrain and flows into a clearwell chamber before discharging.

Constituent Removal

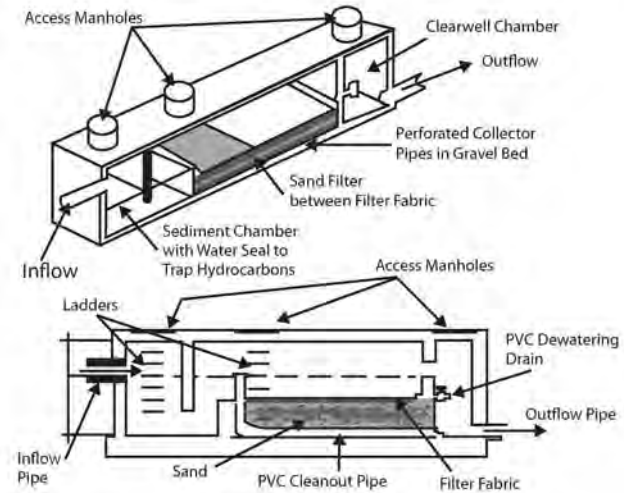

Constituent Group	Removal*
Total Suspended Solids (TSS)	✓
Total Nitrogen	
Total Phosphorus	✓
Pesticides	
Total Metals	✓
Dissolved Metals	✓
Microbiological	✓
Litter	✓
Biochemical Oxygen Demand (BOD)	
Total Dissolved Solids (TDS)	

* Based on Delaware Sand Filter performance (see Appendix C), and data presented by Young et al. (1996). Blank cells indicate data not available or poor treatment performance.

Advantages

- DC Sand Filters are installed in urban settings with covers appropriate for the intended above ground land use such as sidewalks or landscaping
- Performance is similar to the Delaware Sand Filter and Austin Sand Filter, but DC Sand Filters have a narrower footprint and require less head than Austin Sand Filters. They are also designed to receive concentrated flows at one end, whereas Delaware Sand Filters are designed for sheet flows along one side

Schematic

Source: EPA

Key Design Elements

- Flood flow routing and bypass
- Media area and depth
- Media grain size

Constraints

- Designed to treat impervious areas of one acre or less
- If media clogs, resulting standing water may create mosquito habitat
- No infiltration and volume reduction when constructed within a concrete vault
- Confined space entry
- Entry needs to be kept accessible
- The sedimentation basin holds a permanent pool of water that has the potential to provide breeding opportunities for mosquitoes

BMP Fact Sheet

Filtration

Bed

DC Sand Filter

Maintenance Issues

Requirements:

- Routine maintenance may include periodic sediment and debris removal as well as spent media replacement
- Vector control or abatement may be required

Special Training:

- Requires training for media maintenance/replacement
- Requires confined space entry training

Project Development Issues

Right-of-Way Requirements:

Space requirements are similar to Delaware Sand Filters

Siting Constraints:

- Do not site where runoff from bare soil or construction activities can enter filter
- Head requirements for gravity drain

Construction:

None identified

Filtration

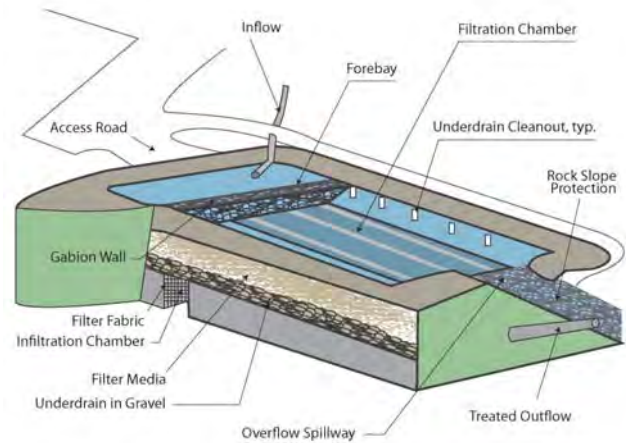

Bed

Infiltration Chambers

Description

Filtration systems provide treatment by filtering out or straining particles and associated pollutants in the stormwater. In bed filters, stormwater flows through one or more layers of open-bed granular media before discharging through an underdrain system. The effectiveness of the system depends on the loading rate on the filter, the type, size and porosity of the media, and the type and size distribution of the particles in the incoming stormwater. Infiltration chambers is a concept developed by Caltrans to increase infiltration in conventional BMPs. Addition of infiltration chambers below the invert of bed filters is expected to capture and infiltrate the first flush of stormwater runoff. These infiltration chambers can consist of gravel, high porosity storage media with a sand overlay, or native soil that has been amended to improve infiltration.

Schematic

Constituent Removal

Constituent Group	Removal*
Total Suspended Solids (TSS)	✓
Total Nitrogen	
Total Phosphorus	✓
Pesticides	
Total Metals	✓
Dissolved Metals	✓
Microbiological	
Litter	✓
Biochemical Oxygen Demand (BOD)	
Total Dissolved Solids (TDS)	

* Based on performance of an Austin Sand Filter (see Appendix C). Blank cells indicate data not available or poor treatment performance. Small filtration devices operating at relatively high loading rates may not provide treatment as indicated.

Source: Caltrans

Advantages

- Potential for improved infiltration, even in poorly infiltrating soils
- Expected to improve treatment of fine particles, nutrients, and dissolved constituents relative to conventional sand filters

Constraints

- Not suitable in areas with high seasonal groundwater
- Increases construction and rehabilitation costs relative to conventional sand filters
- If media clogs, resulting standing water may create mosquito habitat

Key Design Elements

- Soil type and permeability
- Infiltration chamber volume capacity
- Infiltration chamber material (high porosity storage media, gravel, amended soil, etc.)
- Flood flow routing and bypass
- Media grain size, area, and depth
- Outlet orifice plate to control media contact time
- Maintenance access

Maintenance Issues**Requirements:**

- Routine maintenance may include periodic sediment and debris removal as well as spent media replacement
- Vector control or abatement may be required
- May require construction equipment to rehabilitate clogged system
- Sediment removal

Special Training:

Unknown

Project Development Issues**Right-of-Way Requirements:**

Space requirements are the same as those for conventional filters

Siting Constraints:

- Site where there is sufficient hydraulic head to facilitate drainage through the sand bed
- Requires separation between seasonal high groundwater and basin invert
- Avoid locations with base flow because of possible clogging due to algae growth

Construction:

- If exposed to construction site runoff, remove and replace media after drainage area has been completely stabilized
- Minimize compaction of underlying soils to maintain infiltration capacity
- Bypass water until drainage area is stabilized

Filtration

Bed

Linear Filter Trench

Description

Filtration systems provide treatment by filtering out or straining particles and associated pollutants in the stormwater. The Linear Filter Trench, a concept developed by Caltrans that is based on the Delaware Sand Filter, is intended for the narrow right-of-way that is typical of roadside areas. It consists of a sedimentation chamber with a permanent pool of water and a filter chamber with an underdrain. The Linear Filter Trench, however, would be constructed away from load-bearing areas so that trench construction can help reduce cost. A trench cover material on top of the sedimentation area prevents mosquito access to standing water. The use of a high-porosity storage media supports the overlay while maintaining the capture volume of the sedimentation chamber.

Constituent Removal

Total Nitrogen	
Total Phosphorus	✓
Pesticides	
Total Metals	✓
Dissolved Metals	✓
Microbiological	✓
Litter	✓
Biochemical Oxygen Demand (BOD)	
Total Dissolved Solids (TDS)	

* Based on performance of a Delaware Sand Filter (see Appendix C). Blank cells indicate data not available or poor treatment performance.

Advantages

- Fits in a narrow right-of-way
- Lower construction costs than conventional below grade filters because of minimal use of concrete
- Can provide infiltration and volume reduction
- Can be constructed without pretreatment by a grass filter strip

Schematic

Source: Caltrans

Key Design Elements

- Flood flow routing
- Water quality flow and detention time (if flow-based design)
- Storage volume and sand/gravel pore space (if volume-based design)
- Media type, grain size, and area
- Ponding depth above filter
- Traffic rating
- Maintenance access

Constraints

- The sedimentation chamber holds a permanent pool of water and has the potential to provide breeding opportunities for mosquitoes
- May require confined space entry
- Unknown maintenance frequency
- Maintenance activities may require traffic control

BMP Fact Sheet

Filtration

Bed

Linear Filter Trench

Maintenance Issues

Requirements:

- Disposal of accumulated trash and replacement of the upper few inches of sediment and sand when the filter clogs
- Vector control or abatement may be required

Special Training:

Requires training for media maintenance/replacement

Project Development Issues

Right-of-Way Requirements:

Designed to fit in a narrow right-of-way

Siting Constraints:

- Do not site where runoff from bare soil or construction activities will be allowed to impact the filter
- Minimum head requirement of two feet

Filtration

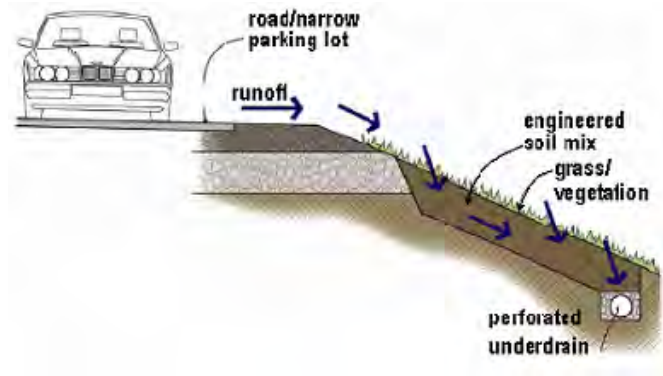

Bed

Media Filter Drain

Description

Filtration systems provide treatment by filtering out or straining particles and associated pollutants in the stormwater. In bed filters, stormwater flows through one or more layers of open-bed granular media before discharging through an underdrain system. The effectiveness of the system depends on the loading rate on the filter, the type, size and porosity of the media, and the type and size distribution of the particles in the incoming stormwater. The Media Filter Drain is a bed filtration system that can be integrated into slopes adjacent to roadways. The concept, developed by the State of Washington's Department of Transportation, is typically constructed to accept sheet flow along its length. Water passes into a porous, alkalinity-generating media that is placed in a shallow excavation running parallel to the roadway. An underdrain carries filtered water downstream.

Source: Pierce County, Washington State

Key Design Elements

- Preferable lateral slopes less than 25% (4:1)
- Preferable longitudinal slope less than 5%
- Design water quality flow rate
- Bed mixture and dimensions
- Pretreatment needs by biofiltration strips
- Slope stability
- Underdrain
- Maintenance access

Advantages

- Fits in a narrow right-of-way
- No vector concerns, because water treatment is accomplished below surface

Constraints

- Requires sheet flow
- Not suitable for steep lateral and longitudinal slopes
- Vegetation may develop slowly, though filtering still occurs
- Media mix may require washing before installation
- Must avoid concentrated flows
- Maintenance activities may require traffic control

Maintenance Issues

Requirements:

- Maintain uniform sheetflow distribution
- Periodic media maintenance

Special Training:

None identified

Project Development Issues

Right-of-Way Requirements:

Designed to fit in a narrow right-of-way

Siting Constraints:

Not advised in longitudinal slopes steeper than 5%, wetlands, wetland buffers, or unstable slopes

Construction:

Certain soil types may require perforated pipe in the underdrain trench to ensure proper flow through media bed

Filtration

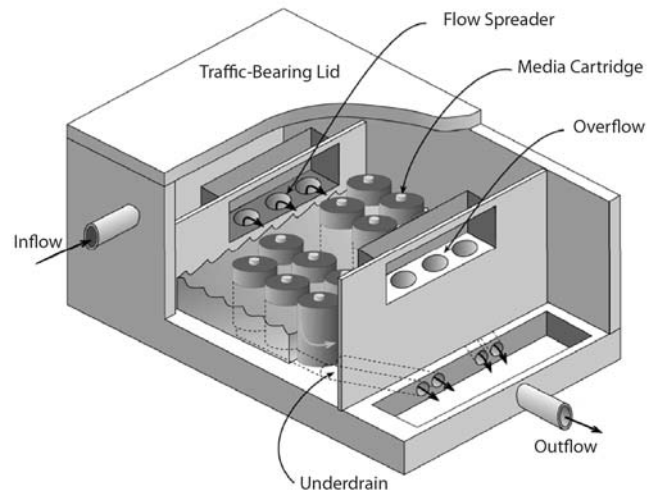

Cartridge/Canister

Description

Filtration systems provide treatment by filtering out or straining particles and associated pollutants in the stormwater. In cartridge/canister systems, the filter media is placed inside cartridges or canisters that are typically enclosed in an underground vault. The media used can be inert, such as sand or gravel, or adsorptive, such as peat or a manufactured media. The effectiveness of these systems depends on the loading rate on the cartridges/canisters, the type, size and porosity of the media, and the type and size distribution of the particles in the incoming stormwater. If the media is adsorptive, the water chemistry will also determine the effectiveness of the filter in removing dissolved constituents. Pretreatment may be necessary prior to filtration to prevent clogging and premature failure of the media.

Schematic

Total Suspended Solids (TSS)	✓
Total Nitrogen	
Total Phosphorus	✓
Pesticides	
Total Metals	✓
Dissolved Metals	
Microbiological	
Litter	✓
Biochemical Oxygen Demand (BOD)	
Total Dissolved Solids (TDS)	

* Based on performance of a StormFilter™ (Caltrans 2004), and best professional judgment. Blank cells indicate data not available or poor treatment performance. Cartridges/canisters operating at relatively high loading rates (about 2 gpm per square foot for each cartridge/canister) may not provide treatment as indicated.

Source: City of Medford, Oregon

Key Design Elements

- Flood flow routing and bypass
- Water quality design flow
- Flow restriction for maximum operational flow
- Media type, grain size, and area (determined by size, configuration, and number of cartridges/canisters)
- Pollutant storage capacity
- Need for pretreatment
- Maintenance access

Advantages

- Can be applied in confined urban areas and areas with limited space if placed in an underground vault
- Suitable for wide range of drainage areas
- Media can be selected to target specific constituents of concern

Constraints

- Can be expensive to construct
- Major maintenance may be costly due to the large number of filter canisters required
- Proprietary device
- Media may be proprietary
- Requires pretreatment
- A permanent pool of water in the treatment vault of some configurations can provide mosquito breeding opportunities
- Small storm events may not actuate the floats in some systems, and the water will reside in the unit until the next storm
- May require confined space entry
- Entry needs to be kept accessible

BMP Fact Sheet

Filtration

Cartridge/Canister

Maintenance Issues

Requirements:

- Periodic sediment removal and canister replacement required
- Vector control or abatement may be required
- May require hand cleaning following removal of media canisters

Special Training:

- Training in use of equipment needed to remove media canisters and clean out pretreatment vault
- Must be trained to repair or replace any cartridge filter or part, or plan to contract for maintenance
- Training needed for confined space entry

Project Development Issues

Right-of-Way Requirements:

Space requirements depend on sizing criteria, but typically smaller than basins

Siting Constraints:

- Do not allow runoff from bare soil or construction activities to enter filter
- Sufficient hydraulic head is needed to operate filter

Construction:

None identified

Filtration

Fabric

Description

Filtration systems provide treatment by filtering out or straining particles and associated pollutants in the stormwater. In fabric filters, stormwater flows through fabric, typically in the form of a sequence of baffles. The effectiveness of the system depends on the loading rate on the fabric, the type, number of layers, and apparent opening size of the fabric, and the type and size distribution of the particles in the incoming stormwater. A fabric filtration system can be used as pretreatment for a subsurface detention or infiltration system.

Total Dissolved Solids (TDS)	

* Based on best professional judgment. Blank cells indicate data not available or poor treatment performance. Small filtration devices operating at relatively high loading rates may not provide treatment as indicated.

Advantages

- No negative aesthetic impact if installed below grade
- Can be used to provide pretreatment for other BMPs

Schematic

Source: Caltrans

Key Design Elements

- Flood flow routing and bypass
- Fabric type, area, and apparent opening size
- Pollutant storage capacity
- Maintenance access

Constraints

- May be difficult to achieve complete draining in a buried system
- Difficult to inspect and maintain because it is buried
- May require confined space entry
- Fabric panels may clog quickly
- A permanent pool of water in the treatment vault of some configurations can provide mosquito breeding opportunities

BMP Fact Sheet

Filtration

Fabric

Maintenance Issues

Requirements:

- Replace fabric panels
- Because of site-specific loading, several wet season inspections may be required to determine maintenance frequency

Special Training:

Training needed for confined space entry

Project Development Issues

Right-of-Way Requirements:

Small footprint BMP

Siting Constraints:

May not be feasible in areas with high sediment and organic load because of premature clogging of fabric

BMP Fact Sheet

Filtration

Pressure

Description

Filtration systems provide treatment by filtering out or straining particles and associated pollutants in stormwater. In pressurized filtration systems, an external pump is used to force water through a media, fabric, or micro-discs. The media can be inert, such as sand or gravel, or adsorptive, such as peat or a manufactured media. The effectiveness of the system depends on the loading rate on the media or fabric, the type, size and porosity of the media or fabric, and the type and size distribution of the particles in the incoming stormwater. If the media is adsorptive, the water chemistry will also determine the effectiveness of the filter to remove dissolved constituents. Pressure filtration is more common for construction site runoff than for post-construction.

Constituent Removal

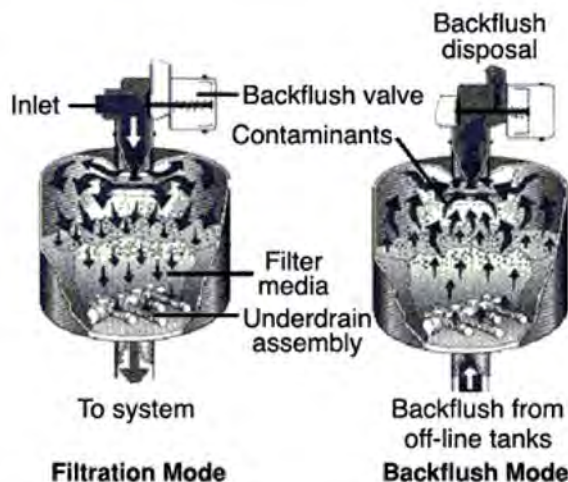

Constituent Group	Removal*
Total Suspended Solids (TSS)	✓
Total Nitrogen	
Total Phosphorus	✓
Pesticides	
Total Metals	✓
Dissolved Metals	
Microbiological	✓
Litter	✓
Biochemical Oxygen Demand (BOD)	
Total Dissolved Solids (TDS)	

* Based on best professional judgment. Blank cells indicate data not available or poor treatment performance.

Advantages

- Using pressure rather than gravity to force water through a media bed allows a smaller footprint
- Backwashing cycle cleans sediment from the filter media as opposed to periodically excavating a portion of the media as required for slow-rate sand filters
- Pressure filter technology uses pumps, which allow more layout flexibility than gravity filtration systems

Schematic

Source: Virginia Cooperative Extension

Key Design Elements

- Facilities required upstream to capture runoff and provide pretreatment
- Power supply
- Flood flow routing and bypass
- Design flow
- Media type, grain size, and area
- Backwash cycle water storage and disposal
- Maintenance access

Constraints

- Connection to sewer or drying bed needed for backwashed wastewater
- Connection to a clean water tank is needed for backwashing
- Power supply required for pump
- More maintenance is needed for a pressure filter than for a gravity filter because of the use of mechanical equipment
- Requires a pretreatment system for litter and debris
- Requires a higher level of operator observation than that for other BMPs

BMP Fact Sheet

Filtration

Pressure

Maintenance Issues

Requirements:

- Mechanical equipment must be maintained
- Pretreatment may be necessary prior to filtration to prevent clogging and premature failure
- Pressure filters require backwashing, a process in which water is forced through the media bed in an opposite direction. The backwashed wastewater must be disposed if a sanitary sewer connection is not available

Special Training:

Crews need to be trained to operate and maintain equipment

Project Development Issues

Right-of-Way Requirements:

Total footprint may be high (including facilities required upstream to capture runoff and provide pretreatment)

Siting Constraints:

- Restricted to sites with available power nearby
- Space required for upstream pretreatment system
- Requires a sanitary sewer connection or dry beds

Construction:

Unknown

BMP Fact Sheet

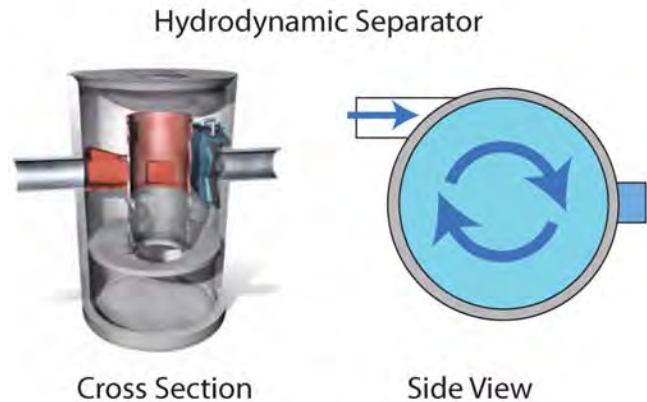

Hydrodynamic Separator

Description

Hydrodynamic separators, also called vortex separators or swirl concentrators, are cylindrical structures in which water moves in a centrifugal fashion rather than in a straight line. Stormwater enters the separator tangentially and creates a swirling vortex flow pattern that allows larger particles to settle out by gravity around the outer edges of the main chamber. Differences between configurations include the nature and type of internal flow-modifying components and the location of inlets and outlets. Hydrodynamic separators are small footprint devices that can be used in small spaces. The effectiveness of these devices depends on the flow rate, the size and configuration of the device, and the sediment characteristics (i.e., type and size distribution of the particles) of the incoming stormwater.

* Based on best professional judgment. Blank cells indicate data not available or poor treatment performance. Treatment for separators operating at relatively high flow rates or with poor sediment retention ability may not be as indicated.

Source: University of New Hampshire Stormwater Center

Advantages

- Relatively limited head is needed to operate device
- Can be used to provide pretreatment for other BMPs

Key Design Elements

- Flood flow routing and bypass
- Water quality design flow
- Detention time
- Maximum operational flow
- Sediment storage capacity and ability to prevent scouring
- Maintenance access

Constraints

- A permanent pool of water is often maintained in the unit, creating a breeding opportunity for mosquitoes
- Not effective for removing dissolved constituents or fine particles
- Can be a source of pollutants due to decomposition of previously captured material unless maintained regularly
- Maintenance activities may require traffic control if the device is installed along the traveled way
- Proprietary device

BMP Fact Sheet

Infiltration

Below Grade

Description

Infiltration BMPs provide treatment by allowing the stormwater runoff to infiltrate surrounding soils. Pollutants are filtered out as the water percolates through the soils. Infiltration BMPs are assumed to provide 100% treatment of the design water quality volume because no water is discharged to surface waters. An overflow mechanism is recommended in case of clogging.

Constituent Removal

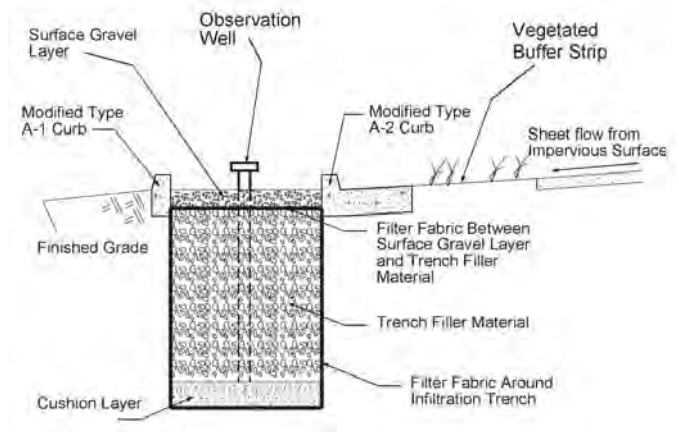

Constituent Group	Removal*
Total Suspended Solids (TSS)	✓
Total Nitrogen	✓
Total Phosphorus	✓
Pesticides	✓
Total Metals	✓
Dissolved Metals	✓
Microbiological	✓
Litter	✓
Biochemical Oxygen Demand (BOD)	✓
Total Dissolved Solids (TDS)	✓

* Based on the assumption that most water is infiltrated and does not overflow, and litter is captured within the BMP. Removal ability reported in the literature is usually based on overflow discharge (Young et al. 1996).

Advantages

- When properly sized in suitable soils, infiltration BMPs eliminate surface discharge up to the design storm
- Below grade infiltration inhibits access for mosquitoes
- Underground BMPs have limited aesthetic impacts
- Caltrans modeling indicates that underlying soils are not likely to become hazardous within five or more years, and typical Caltrans concentrations will not likely impact groundwater quality (Caltrans 2007)

Schematic

Source: Caltrans

Key Design Elements

- Water quality volume
- Permeability of soil
- Distance to groundwater
- Class V injection well determination may be required
- Overhead cover requirements and load-bearing capacity
- Maintenance access

Constraints

- High rehabilitation cost when clogging occurs at the bottom of the trench
- Water percolation may impact structural integrity and stability
- Avoid high groundwater
- Avoid areas prone to spills of groundwater contaminants
- Potential EPA Class V injection well regulations
- Higher construction costs per capture volume than infiltration basins
- Although narrow, could be a large footprint BMP depending on design constraints

BMP Fact Sheet

Infiltration

Below Grade

Maintenance Issues

Requirements:

- Rehabilitation is required when the system clogs. Rehabilitation requires construction equipment
- Young et al. (1996) report that below grade infiltration (trenches, specifically) may require reconstruction every 10 years

Special Training:

Training in confined space entry

Project Development Issues

Right-of-Way Requirements:

- Space requirements are less than infiltration basins because of vertical side walls
- Pretreatment is recommended

Siting Constraints:

Permeable soils and adequate separation to groundwater

Construction:

- Avoid clogging the underlying soils by compaction from vehicles, or by fine particles introduced during or after construction
- Bypass water until drainage area is stabilized

BMP Fact Sheet

Infiltration

Below Grade

Description

Infiltration BMPs provide treatment by allowing stormwater runoff to infiltrate surrounding soils. Pollutants are filtered out as the water travels through the soils. Infiltration BMPs are assumed to provide 100% treatment because the design water quality volume is not discharged to surface waters. An overflow mechanism is recommended in case of clogging. The Linear Infiltration Filter Trench is a non-proprietary design developed by Caltrans in which stormwater flows as sheet flow through a sand filter prior to infiltration. Treatment within the sand layer reduces clogging of the trench, inhibits mosquito access in areas where slow soil infiltration results in standing water, and may eliminate the need for pretreatment. The trench is backfilled with gravel or a high porosity media that is available from several suppliers.

Constituent Removal

Constituent Group	Removal*
Total Suspended Solids (TSS)	✓
Total Nitrogen	✓
Total Phosphorus	✓
Pesticides	✓
Total Metals	✓
Dissolved Metals	✓
Microbiological	✓
Litter	✓
Biochemical Oxygen Demand (BOD)	✓
Total Dissolved Solids (TDS)	✓

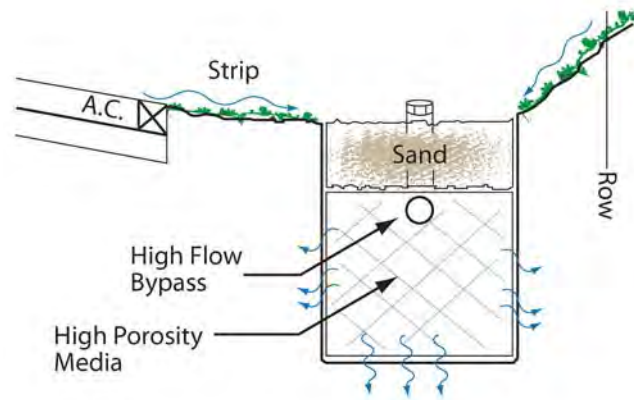

* Based on the assumption that most water is infiltrated and does not overflow, and that litter is captured within the BMP.

Advantages

- Designed to fit a narrow right-of-way
- When properly sized in suitable soils, infiltration BMPs eliminate surface discharge up to the design storm
- Below grade infiltration inhibits access for mosquitoes
- Underground BMPs have limited aesthetic impact
- Caltrans modeling indicates that underlying soils are not likely to become hazardous within five or more years, and that typical Caltrans concentrations will not likely impact groundwater quality (Caltrans 2009)

Linear Infiltration Filter Trench

Schematic

Source: Caltrans

Key Design Elements

- Water quality volume
- Permeability of soil and sand
- Distance to groundwater
- Load-bearing capacity
- Maintenance access
- Ponding depth above the sand

Constraints

- High rehabilitation cost when clogging occurs at the bottom of the trench
- Water percolation may impact structural integrity and stability
- Avoid high groundwater
- Avoid areas prone to spills of groundwater contaminants
- Higher construction costs per capture volume than infiltration basins
- Although narrow, could be a large footprint BMP depending on design constraints

BMP Fact Sheet

Porous Surface

Asphalt Overlay

Description

A porous asphalt overlay, also called an open graded or permeable friction course, is a layer of porous asphalt applied on top of conventional pavement. Stormwater drains through the porous asphalt layer to the conventional road surface below, and then travels along the boundary between the pavement types until it emerges as runoff at the edge of the pavement. The porous layer reduces traffic noise and improves safety by reducing splash and draining water away from the surface. Studies suggest that porous asphalt overlays may also provide water quality benefits by trapping particulates and by reducing the amount of pollutants washed from vehicles.

Constituent Removal

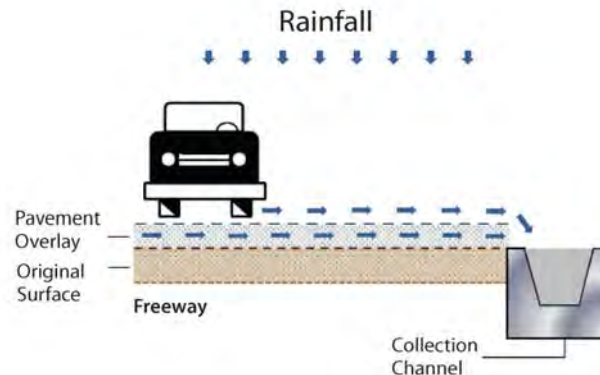

Constituent Group	Removal*
Total Suspended Solids (TSS)	✓
Total Nitrogen	
Total Phosphorus	✓
Pesticides	
Total Metals	✓
Dissolved Metals	
Microbiological	
Litter	
Biochemical Oxygen Demand (BOD)	
Total Dissolved Solids (TDS)	

* Based on removals found by Stanard et al. (2008). Blank cells indicate data not available or poor treatment performance.

Advantages

- Reduces or eliminates space needed for other BMPs
- Increases road safety and reduces traffic noise
- Suitable for highway application

Schematic

Source: Caltrans

Key Design Elements

- Load requirements
- Gradation of asphalt mix
- Thickness of porous layer

Constraints

- Not feasible where traction sand is applied
- More costly than traditional asphalt concrete
- Durability affected by temperature and traffic load
- Water quality benefit expected to deteriorate with overlay age due to clogging of pores

BMP Fact Sheet

Porous Surface Asphalt Pavement

Description

Porous asphalt pavement, with a life span of 20 years or more, provides stormwater storage and infiltration. Porous asphalt pavement is composed of a permeable asphalt surface placed over a granular “choke” course that is on top of a reservoir of large stone. The lower reservoir layer is designed for load requirements and water storage capacity. An overflow for the reservoir layer is recommended in case of insufficient infiltration. The pavement may also be designed to receive off-site runoff.

Constituent Removal

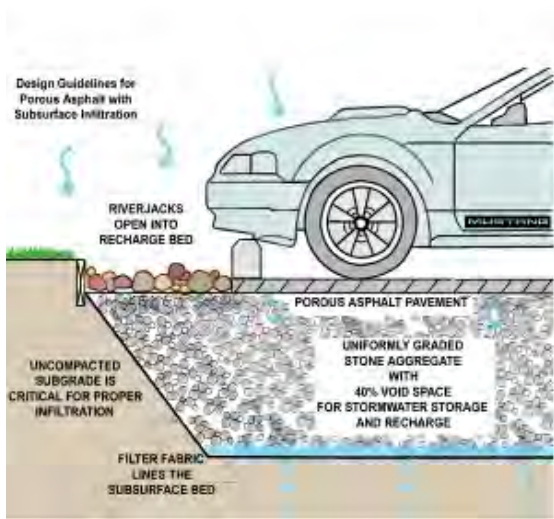

Constituent Group	Removal*
Total Suspended Solids (TSS)	✓
Total Nitrogen	✓
Total Phosphorus	✓
Pesticides	✓
Total Metals	✓
Dissolved Metals	✓
Microbiological	✓
Litter	
Biochemical Oxygen Demand (BOD)	✓
Total Dissolved Solids (TDS)	✓

* Removals are assumed to be due to 100% infiltration of the design water quality volume because no water is discharged to surface waters. Blank cells indicate data not available or poor treatment performance. Removals reported in literature are usually based on overflows from the reservoir course (UNH 2007).

Advantages

- Eliminates surface discharge up to the design storm when properly sized in suitable soils
- Below grade infiltration inhibits access for mosquitoes
- Reduces or eliminates space needed for other BMPs
- Infiltration addresses all pollutants, except litter
- Caltrans modeling indicates that underlying soils will not likely become hazardous within five or more years, and typical Caltrans concentrations will not likely impact groundwater quality (Caltrans 2007)

Schematic

Source: Cahill Associates

Key Design Elements

- Water quality volume
- Permeability of soil
- Distance to groundwater
- Load requirements
- Gradation of asphalt mix

Constraints

- Only suitable for low traffic areas, such as Park and Ride lots
- Low permeability in the subgrade will increase discharge through the over drain and decrease removal efficiency
- Not feasible where traction sand is applied
- More costly than traditional asphalt concrete
- Durability affected by temperature
- Potential contamination from spills
- Water quality benefit expected to deteriorate with pavement age due to clogging of pores in the porous asphalt

BMP Fact Sheet

BMP Fact Sheet

Porous Surface

Concrete Pavement

Description

Concrete porous surfaces allow infiltration into either storage basins or, more typically, into underlying soils. This unique cement-based concrete product with a porous structure is comprised of Portland cement, coarse aggregate rock, and water. The porous texture allows water to drain through it and into the underlying soils or reservoir. Because water infiltrates, hazards associated with standing water are less likely. An overflow mechanism is recommended in case of clogging of the underlying soils or reservoir. Suppliers of traditional concrete can usually mix and deliver porous concrete.

BMP Fact Sheet

Porous Surface

Permeable Pavers/Cellular Confinement

Description

Permeable pavers allow infiltration into either storage basins or, more typically, into underlying soils. Permeable pavers are fairly durable with a life span of approximately 20 years, and possibly more with proper maintenance. Typically built on an open-graded, crushed stone base, permeable pavers interlock or have a minimal sand-filled gap between them. As with most permeable surfaces, the lower reservoir layer is designed for load requirements and water storage capacity. An overflow mechanism for the underlying soils or reservoir is recommended in case of clogging. The pavement may also be designed to receive off-site runoff.

BMP Fact Sheet

Screening

Gross Solids Removal

Description

Gross solids, which consist of litter, debris, and vegetation, can be removed by passing the stormwater runoff through metal or fabric screens. Screens provide treatment by preventing solids larger than the screen opening from passing through. The effectiveness of screening systems depends on the flow rate, the type and opening size of the screen, and the type and size distribution of the gross solids in the incoming stormwater.

Water Quality Inlet

Oil/Water Separator

Description

Water quality inlets, also called oil/grit separators or oil/water separators, consist of a series of chambers that promote sedimentation of coarse materials and separation of free oil (as opposed to emulsified or dissolved oil) from stormwater. Most water quality inlets also contain screens to help retain larger or floating debris, and may include a coalescing unit that helps to promote oil/water separation. Water quality inlets typically capture only the first portion of runoff for treatment, and are generally used for pretreatment of runoff before discharging to other BMPs.

Advantages

- Relatively small footprint
- Simple maintenance

Schematic

Source: City of Medford, Oregon

Key Design Elements

- Hydraulic capacity and pollutant storage capacity
- Provision for overflow or bypass
- Detention time
- Vector control if permanent pool present
- Maintenance access

Constraints

- Limited pollutant removal, especially for fine particles and dissolved constituents
- Vector concern if permanent pool present
- Can be a source of pollutants due to decomposition of previously captured material unless maintained regularly
- May require confined space entry

BMP Fact Sheet

Water Quality Inlet

Oil/Water Separator

Maintenance Issues

Requirements:

- Because of site-specific loading, several wet season inspections may be required to determine appropriate maintenance frequency
- Vector equipment is recommended for cleaning, but is not required
- Vector control or abatement may be required

Special Training:

Training may be required for confined space entry

Project Development Issues

Right-of-Way Requirements:

Relatively small footprint

Siting Constraints:

- Minimal head requirement
- Effective oil removal by similar technologies usually requires influent concentrations above 50 mg/L (Caltrans 2004)

Construction:

None identified

blank for double sided printing

Description

Biofiltration strips are relatively flat, vegetated areas that accept stormwater runoff as sheet flow. Removal mechanisms include sedimentation, filtration, and infiltration. Strips can be used as pretreatment to infiltration trenches and basins, and sand filters. They can also be used in treatment trains with other BMPs.

Rating Key for Constituent Removal Efficiency and Level of Confidence

● ● ○
High Medium Low

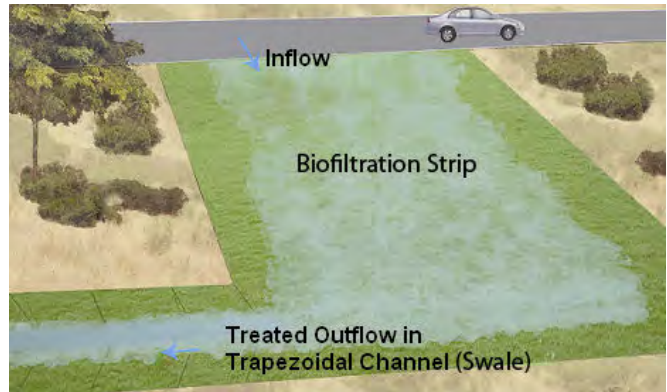

Notes:

Three biofiltration strips were sited, constructed, and monitored as part of the Caltrans BMP Retrofit Pilot Program (2004). Total nitrogen load removal is mostly dependent on infiltration losses. Phosphorus concentrations increased but infiltration compensated so that there was no net export of phosphorus load. This may be due to the vegetation selection of salt grass, which can uptake phosphorus and excrete it on its leaves. Phosphorus removal efficiency may be higher with alternative vegetation. BOD ratings are based on metadata compiled by Young et al. (1996). Pesticide ratings are based on the "Evaluation of Factors Controlling Herbicide Runoff to Surface Water" report (Caltrans 2005). Load removal analysis has been performed for a variety of roadside conditions (Caltrans 2008). Microbiological ratings are based on Rifai (2006) and Clary (2008).

Caltrans Evaluation Status

Approved

Schematic

Source: Caltrans

Key Design Elements

- Maximize flow paths to maximize treatment
- Specify vegetation that occurs naturally to minimize establishment and maintenance costs
- Size the strips as long (in direction of flow) and flat as the site will reasonably allow, up to sheet flow boundaries (maximum length of biofiltration strips is approximately 100 ft)
- Minimum of 70% vegetation coverage
- Caltrans designers should follow the Project Planning and Design Guide (Caltrans 2007)

Cost Effectiveness Relative to Detention Basins

Notes:

Maintenance Issues**Requirements:**

- Regular inspections for side slope stability, debris and sediment accumulation, vegetative cover, and presence of burrowing animals
- If acceptable cover is not achieved, reseed or some type of erosion control will be needed

Special Training:

None identified

Project Development Issues**Right-of-Way Requirements:**

Large footprint, but can be placed on fill slopes and occupy the clear recovery zone

Siting Constraints:

- Requires sheet flow, so site in areas where sheet flow predominates
- Climate and soil conducive to sustainable plant growth

Construction:

Minimize soil compaction

Advantages

- High removal efficiencies for total suspended solids and total metals
- Generally inexpensive relative to other BMPs
- Potential for substantial infiltration

Constraints

- Soil may need to be conditioned to allow vegetation to establish
- Climate may preclude vegetation establishment

Description

Biofiltration swales are vegetated conveyance channels that concentrate flow. Removal mechanisms include filtration, infiltration, and sedimentation. Swales can be integrated into treatment trains with other type of BMPs.

Rating Key for Constituent Removal Efficiency and Level of Confidence

● ● ○
High Medium Low

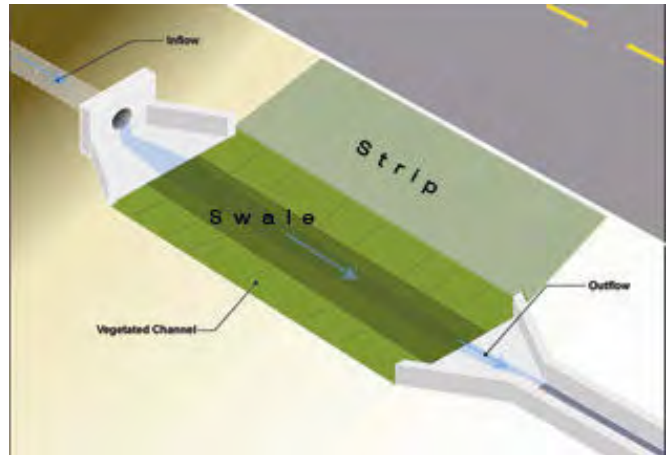

Notes:

Six biofiltration swales were sited, constructed, and monitored as part of the Caltrans BMP Retrofit Pilot Program (Caltrans 2004). Total nitrogen load removal is highly dependent on infiltration losses. Phosphorus concentrations increased but infiltration compensated so that there was no net export of phosphorus load. This may be due to the vegetation selection of salt grass, which can uptake phosphorus and excrete it on its leaves. Phosphorus removal efficiency may be higher with alternative vegetation, though analysis of the international BMP database by Barrett (2008) suggests a low removal rate. BOD ratings are based on metadata compiled by Young et al. (1996). Pesticide ratings are based on the findings in the “Evaluation of Factors Controlling Herbicide Runoff to Surface Water” report (Caltrans 2005).

Approved

Schematic

Source: Caltrans

Key Design Elements

- Length slope and width as quantified by the hydraulic residence time
- Specify vegetation that occurs naturally to minimize establishment and maintenance costs
- Minimum vegetation cover
- Energy dissipaters
- Side slopes constructed of narrow berms are not recommended because they are prone to damage by gophers or other burrowing animals
- Scour velocity
- Check dams may enhance infiltration
- Caltrans designers should follow the Project Planning and Design Guide (Caltrans 2007)

Cost Effectiveness Relative to Detention Basins

Cost ↓	Cost ↑
Benefit ↓	Benefit ↓
Cost ↓	Cost ↑

Rating Key for Cost Effectiveness Level of Confidence

● ● ○
High Medium Low

Notes:

Based on retrofit costs. Cost for new construction may be substantially lower.

Maintenance Issues

Requirements:

- Regular inspections for side slope stability, debris and sediment accumulation, vegetation height, vegetative cover, and presence of burrowing animals
- If acceptable cover is not achieved, reseeded or some type of erosion control will be needed

Special Training:

None identified

Project Development Issues

Right-of-Way Requirements:

Sufficient space required to achieve the target hydraulic residence time

Siting Constraints:

- Place in areas of natural lows or cut sections to minimize damage caused by gophers or other burrowing animals
- Climate and soil conducive to sustainable plant growth

Construction:

None identified

Advantages

- Incorporates well into the environment
- Effective removal efficiencies for total suspended solids and total metals
- Potential for substantial infiltration

Constraints

- Soil may need to be conditioned to allow vegetation to establish
- Climate may preclude vegetation establishment

BMP Fact Sheet

Detention Basin

Description

A detention basin is an impoundment that collects stormwater via storm drain inlets. The basin captures and detains the design runoff volume (typically for 48 hours). Discharges from the basin typically occur through a perforated riser. The basin removes floatable debris and coarse suspended solids. Pollutant removal is achieved primarily through settling of sediments and particulate forms of pollutants.

Constituent Removal

Constituent Group	Removal Efficiency	Level of Confidence
Total Suspended Solids (TSS)	●	●
Total Nitrogen	○	●
Total Phosphorus	●	●
Pesticides	NA	
Total Metals	●	●
Dissolved Metals	○	●
Microbiological	○	○
Litter	●	●
Biochemical Oxygen Demand (BOD)	NA	
Total Dissolved Solids (TDS)	NA	

Rating Key for Constituent Removal Efficiency and Level of Confidence

● High ● Medium ○ Low

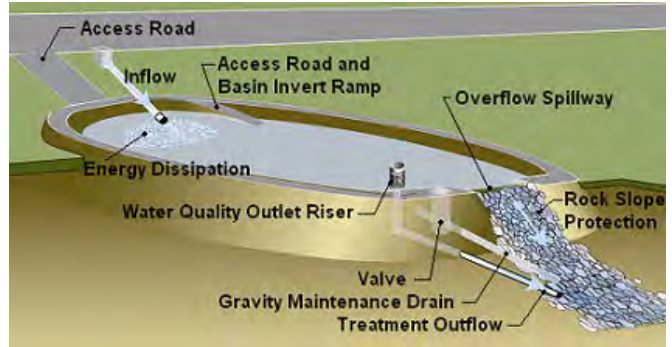

Notes:

Removal efficiency and levels of confidence ratings are based on results from unlined detention basins. The Caltrans Retrofit Pilot Program (2004) constructed five detention basins for study. The litter removal rating is based on best professional judgment.

Caltrans Evaluation Status

Approved

Cost ↓	Cost ↑
Benefit ↓	Benefit ↓
Cost ↓	Cost ↑

Rating Key for Cost Effectiveness Level of Confidence

● High ● Medium ○ Low

Notes:

Cost assessment is not applicable because cost effectiveness is relative to detention basins. Cost comparisons to other BMPs are based on a 20-year life cycle cost of \$673/m³ (1999 dollars) (Caltrans 2004).

BMP Fact Sheet

Detention Basin

Maintenance Issues

Requirements:

- Regular inspections for standing water, side slope stability, debris and sediment accumulation, and vegetative cover
- If vegetative cover of the basin invert or side slopes is not established to acceptable thresholds, reseeded or erosion control measures may need to be implemented
- Sediment removal

Special Training:

None identified

Project Development Issues

Right-of-Way Requirements:

Space requirements are relatively high

Siting Constraints:

- Site where there is sufficient hydraulic head to facilitate complete drainage
- Do not site in areas where groundwater contamination is a concern, unless lined (and anchored to combat floatation)

Construction:

None identified

Advantages

- Relatively easy to operate and maintain
- Potential for substantial infiltration
- Can be sited more easily than Austin filters

Constraints

- Limited pollutant removal for nutrients and dissolved constituents
- Can only be placed in areas with sufficient hydraulic head

BMP Fact Sheet

Dry Weather Flow Diversion

Description

A dry weather flow diversion device can divert dry weather flows from the storm drain system to the sanitary sewer system, and convey it to a publicly owned treatment works (POTW). During wet weather, this diversion is suspended because stormwater flows can be greater than the flow the POTW is designed to manage.

Constituent Removal

Constituent Group	Removal Efficiency	Level of Confidence

Filtration

Bed

Austin Sand Filter

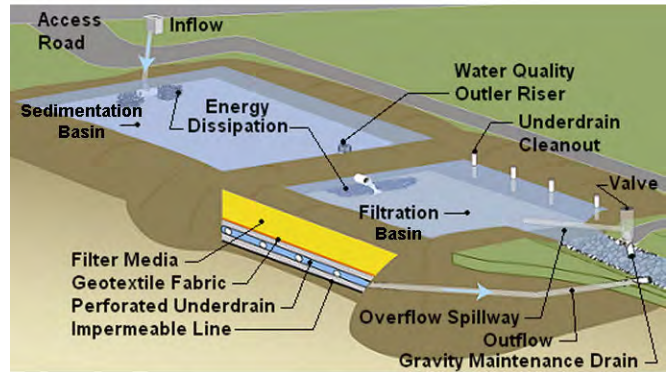

Description

The Austin Sand Filter includes a sedimentation basin and a filtration basin. The sedimentation basin captures and detains the design water quality runoff volume (typically for 24 hrs.) prior to discharge to the filtration basin. The sedimentation basin removes floatable debris and coarse suspended solids, and prevents premature clogging of the filter media surface. The sedimentation chamber effluent discharges to the filtration basin typically through a perforated riser. In the filtration basin, the water first passes through a sand layer, then through a geotextile layer, and finally into a gravel underdrain. Pollutant removal is achieved primarily by physical filtration of pollutants through the filtration media, and the settling of solids in the sedimentation basin. An Austin Sand Filter can also be designed so that the sedimentation and filtration sections are combined into one basin. In this design, gabions are used to disperse water and encourage sedimentation prior to the sand bed.

Notes:

Except where noted, removal efficiency and levels of confidence ratings are based on the Caltrans Retrofit Pilot Program Final Report (2004). Five Austin Sand Filters were constructed and monitored. While nitrate concentrations increased by 35%, total nitrogen decreased by 32%. The phosphorus removal efficiency rating is based on the average of results from Caltrans and Glick et al. (1998). BOD ratings are based on metadata compiled by Young et al. (1996). Litter removal ratings are based on best professional judgment.

Notes:

Cost effectiveness determination pending further evaluation.

Filtration

Bed

Austin Sand Filter

Maintenance Issues

Requirements:

- Media scraping
- Sediment removal
- Media replacement

Special Training:

Training required for media removal and replacement

Project Development Issues

Right-of-Way Requirements:

Space requirements are marginally higher than those for a detention basin

Siting Constraints:

- Head requirement of about 4 feet
- Avoid locations with base flow because of clogging due to algae growth

Construction:

If used for construction site runoff, remove and replace sand after drainage area has been completely stabilized

Advantages

- High constituent removal for suspended solids, total metals, and bacteria
- Provides consistent pollutant removal when properly maintained
- Treats runoff from drainage areas up to 20 hectares

Constraints

- Limited pollutant removal for nutrients
- More expensive to construct than a detention basin

Filtration

Bed

Delaware Sand Filter

Description

Delaware Sand Filters are often located at the curbside edge of a paved area or parking lot, and consist of two parallel concrete chambers: a sedimentation chamber and a sand filter chamber. The sedimentation chamber holds a permanent pool of water. The sedimentation chamber removes coarse suspended solids and prevents premature clogging of the filter media surface. The sedimentation effluent discharges over a weir into the sand filter chamber where water is filtered first through a 12 to 18 inch sand filter, then through a geotextile layer, and finally into an underdrain. These on-line devices process all runoff leaving the site up to the point where the overflow limit is reached. The typical shape of the device is narrower (but longer) than some other treatment BMPs, which can be advantageous in some situations.

Constituent Removal

Constituent Group	Removal Efficiency	Level of Confidence
Total Suspended Solids (TSS)	●	●
Total Nitrogen	○	◐
Total Phosphorus	◐	●
Pesticides	NA	
Total Metals	●	●
Dissolved Metals	◐	●
Microbiological	◐	◐
Litter	●	◐
Biochemical Oxygen Demand (BOD)	○	○
Total Dissolved Solids (TDS)	NA	

Rating Key for Constituent Removal Efficiency and Level of Confidence

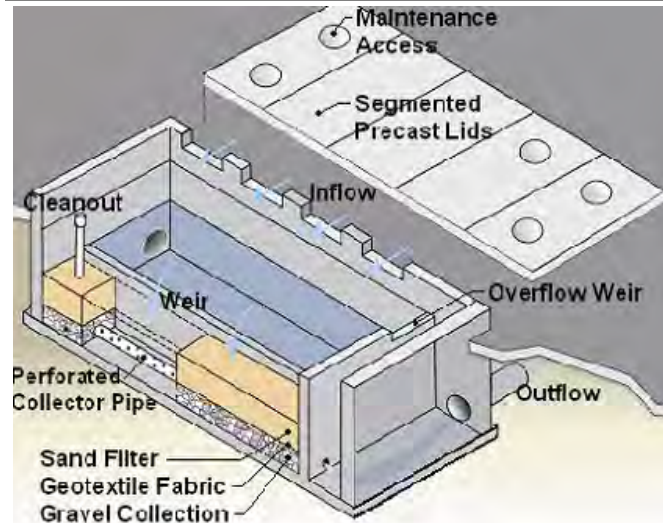

Notes:

This device was sited as part of the Caltrans BMP Retrofit Pilot Program (2004). Although not thought to be effective for removing dissolved constituents, some removal was observed. The litter removal rating is based on best professional judgment. Caltrans (2004) reported that nitrate concentrations increased by 78%, and a high removal efficiency for dissolved zinc. BOD ratings are based on metadata compiled by Young et al. (1996).

Caltrans Evaluation Status

Approved

Schematic

Source: Caltrans

Key Design Elements

- The Delaware unit that was evaluated was designed and installed according to the guidelines described by Young et al. (1996), which requires the sedimentation volume to equal 5 mm of runoff (0.2 inches). Consequently, if it is desired to treat a larger water quality volume, the unit must act as a flow-through device
- Size the filter based on unit values for the sedimentation chamber volume and filter bed area per acre of tributary area treated
- Caltrans designers should follow the Project Planning and Design Guide (Caltrans 2007)

Notes:

Filtration

Bed

Maintenance Issues

Requirements:

- Maintenance for smaller, underground filters is usually best done manually
- Disposal of accumulated trash and replacement of the upper few inches of sand when the filter clogs
- Vector control or abatement

Special Training:

Training required for media removal

Project Development Issues

Right-of-Way Requirements:

Space requirements are relatively high

Siting Constraints:

- Do not site where runoff from bare soil or construction activities will be allowed to enter the filter
- Minimum head requirement of 3 feet
- Avoid locations with base flow

Construction:

None identified

Advantages

- Can be installed underground in urban settings with covers appropriate for the intended above ground land use, such as sidewalk or landscaping
- Similar in performance to the Austin Filter design with the principal advantage being narrower footprint that requires less head
- Waste media from the filters does not appear to be toxic and is likely to be environmentally safe for landfill disposal

Constraints

- The sedimentation basin holds a permanent pool of water and has the potential to provide breeding opportunities for mosquitoes
- Relatively expensive to construct compared to other approved BMPs (Caltrans 2004)
- Limited pollutant removal capability for nutrients

Infiltration

Basin

Description

Infiltration basins are depressions used to detain stormwater runoff until it percolates into the groundwater table. Pollutant removal occurs through the infiltration of runoff and the adsorption of pollutants into the soil and vegetation. Infiltration basins are designed to infiltrate within 72 hours to prevent vector problems due to standing water. There needs to be sufficient space between the basin invert and the seasonally high groundwater elevation to allow infiltration to occur.

Constituent Removal

Constituent Group	Removal Efficiency	Level of Confidence
Total Suspended Solids (TSS)	●	●
Total Nitrogen	●	●
Total Phosphorus	●	●
Pesticides	●	●
Total Metals	●	●

Infiltration

Basin

Maintenance Issues

Requirements:

- Conduct regular inspections for standing water, debris and sediment accumulation, and slope stability
- Avoid rubber tired vehicles in basin to reduce compaction
- Tracked equipment recommended for major maintenance

Special Training:

None identified

Project Development Issues

Right-of-Way Requirements:

Space requirements are relatively high for infiltration basins

Siting Constraints:

- Infiltration basins can only be placed in areas where soil is hydrologic soil group type A, B, or C soils and that meet permeability requirements
- Soil cannot have more than 30% clay or more than 40% clay and silt combined
- Minimum infiltration rate of 0.5 in/hr is preferred
- Distance between the groundwater elevation and the basin invert should be at least 4 feet, but 10 feet is preferable

Construction:

- Stabilize area draining into the facility. If possible, place a diversion berm to prevent sediment from entering the facility
- Build the basin without driving heavy equipment over the infiltration surface. Any equipment should have “low pressure” treads or tires
- After final grading, deeply till the infiltration surface
- Use appropriate erosion control seed mix

Advantages

Due to the infiltration of the entire water quality volume, the constituent removal is considered to be 100%

Constraints

- Site only in areas with the appropriate soil type/content and distance from the groundwater elevation to facilitate infiltration
- Restrict use if the runoff does not meet the requirement of a RWQCB-issued Basin Plan, or if the potential site is above a known pollutant plume

Infiltration

Trench

Description

An infiltration trench is typically a long and narrow excavation that is lined with filter fabric and backfilled with stone aggregate or gravel to form an underground basin. Runoff is diverted to the trench and infiltrates into the soil. Pollutants are filtered out of the runoff as it infiltrates the surrounding soils. Infiltration trenches must be sited in areas where soils meet the minimum infiltration rate. Regulators may caution against installation of this device in highly industrial areas or areas where highly soluble constituents may be discharged to the trench.

Notes:

Infiltration

Trench

Maintenance Issues

Requirements:

- Remove trash and debris from the site on a regular basis
- Sediment accumulation should be inspected and, if visible on top of the trench, the top layer of trench, silt, filter fabric, and stone should be removed
- Replace fabric; stone can be reinstalled after it is washed

Special Training:

None identified

Project Development Issues

Right-of-Way Requirements:

Space requirements are relatively high, but it can fit in a narrow right-of-way

Siting Constraints:

- Do not site within about 100 feet of building or bridge foundations. Infiltration trenches sited within about 100 feet would require detailed site structural and geotechnical investigation. Infiltration trenches are suitable for drainage areas up to 4 hectares. Trenches work best at sites with an up-gradient drainage area slope of less than 5%
- Trenches should be sited where infiltration rates are at least one-half in/hr and there is at least about 10 feet separation between trench invert and the groundwater
- Trenches are not recommended in industrial land use areas or in locations where soluble constituents may impact ground water quality

Construction:

- During excavation for trench construction, light equipment should be used to avoid compaction of the soil
- Stabilize the entire area draining to the facility before construction begins. If impossible, place a diversion berm around the perimeter of the infiltration site to prevent sediment entrance during construction

Advantages

- Due to the infiltration of the entire water quality volume, the constituent removal is considered to be 100%
- Infiltration trenches can be narrow and are not highly visible

Constraints

- Infiltration trenches must have soils with adequate permeability and suitable groundwater separation
- Major maintenance (removal and replacement of the rock matrix) is relatively costly
- Pretreatment is recommended to reduce the amount of influent sediment
- Construction costs per capture volume are higher than infiltration basins
- Can clog prematurely if not properly maintained

Litter and Debris Removal

GSRD–Inclined Screen

Description

The Gross Solids Removal Device (GSRD) Inclined Screen (IS) is a non-proprietary device whose primary function is to remove gross solids (litter and vegetative material) from stormwater runoff. Currently, there is one IS configuration approved as a full capture treatment device. This GSRD IS has a parabolic wedge-wire screen with spacing up to 5 mm (Caltrans 2007). The device is configured with an influent trough to allow some solids to settle (see schematic).

Notes:

Litter ratings are based on field studies (Caltrans 2003). Litter removal is the target constituent for the device. No long-term water quality monitoring studies have been conducted to evaluate treatment effectiveness of the GSRD IS on other water quality constituents.

Caltrans Evaluation Status

Approved

Schematic

Source: Caltrans

Key Design Elements

- Size the GSRD IS to hold gross solids to be deposited during a 1-year period and pass the design flow (e.g., 25-year flow)
- Regulations may have a lower design storm than is associated with the drainage of the highway, and if upstream diversion is used the design event given in the regulation could be used
- Hydraulic head
- Caltrans designers should follow the Project Planning and Design Guide (Caltrans 2007)

Litter and Debris Removal

GSRD–Linear Radial

Description

The Gross Removal Device (GSRD) Linear Radial (LR) is a non-proprietary device whose primary function is to remove gross solids (litter and vegetative material) from stormwater runoff. Currently, there is one GSRD LR configuration approved as a full capture treatment device. This GSRD LR utilizes a modular well casing with 5 mm x 64 mm louvers to serve as the screen. The GSRD LR is placed on a 2-percent slope.

Multi-Chambered Treatment

Description

Multi-chambered treatment trains (MCTTs) use three treatment mechanisms. The first chamber is a catch basin used to remove large, grit-sized material. The second chamber is a settling chamber that removes settleable solids with tube separators, and oil and grease with sorbent pads. The third chamber is a sand/peat filter. The filtration chamber consists of a 450-µm filter media layer with a 50/50 mixture of sand and peat moss. This layer is separated from a gravel-packed underdrain by a layer of filter fabric. The filter area is determined from the recommended solids loading rate of a peat/sand mixture (5000 g TSS/m²/year). Gravity draining can be used to return the filtered runoff to the drainage system. These devices were originally designed to reduce toxicity in the runoff from critical stormwater source areas and to be implemented where toxicity in runoff is an identified problem.

Constituent Removal

Constituent Group	Removal Efficiency	Level of Confidence
Total Suspended Solids (TSS)	●	●
Total Nitrogen	○	○
Total Phosphorus	○	○
Pesticides	NA	
Total Metals	◐	●

Microbiological	○	○
Litter	●	◐
Biochemical Oxygen Demand (BOD)	NA	
Total Dissolved Solids (TDS)	NA	

Rating Key for Constituent Removal Efficiency and Level of Confidence

● ◐ ○
High Medium Low

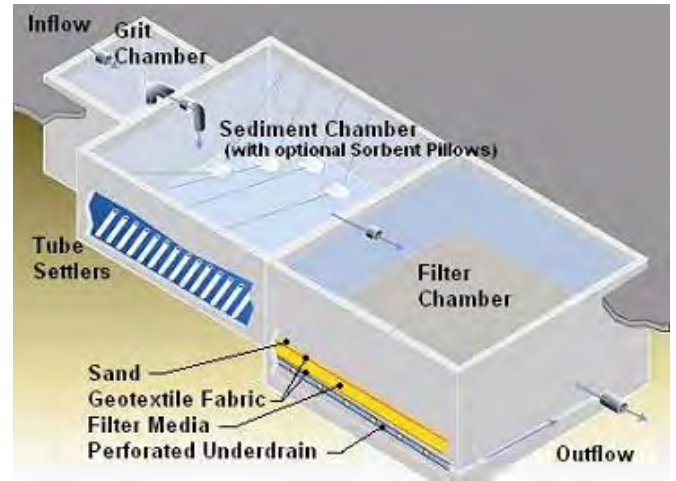

Notes:

Two MCTTs were sited, constructed, and monitored as part of the Caltrans BMP Retrofit Pilot Program (2004). The high TSS removal efficiency rating is based on Pitt et al. (1996). Caltrans data showed 75% TSS removal, but average influent was only 41 mg/L, nitrate concentrations increased by 62%, and dissolved zinc removal efficiency rating was high (Caltrans 2004). The litter removal efficiency rating is based on best professional judgment. Level of confidence based on the Caltrans study.

Caltrans Evaluation Status

Notes:

Multi-Chambered Treatment

Maintenance Issues

Requirements:

- Periodic cleaning and replacement of media
- Inspection of mosquito proofing
- Vector control or abatement

Special Training:

Training required for media replacement

Project Development Issues

Right-of-Way Requirements:

Space requirements are relatively high

Siting Constraints:

- Site where there is a small, impervious contributing watershed
- Do not site MCTTs where runoff from bare soil or construction activities will be allowed to enter the filter
- MCTTs should be sited where enough vertical clearance (head) is provided, about 6.5 feet

Construction:

- Material availability for the filter, excavation for the device/unknown field conditions, and interface with existing activities at the site are the primary issues to be addressed in the construction of MCTTs
- The tube settler system is a special order item with a significant lead time

Advantages

- Constituent removal for suspended solids, metals, and bacteria similar to that for an Austin Sand Filter
- The MCTTs can provide consistent pollutant removal when properly maintained
- The target area for use of MCTTs are vehicle service facilities, parking areas, paved storage areas, and fueling stations with drainage areas up to 1 hectare

Constraints

- More expensive to construct than gravity drained Austin Sand Filters, which provide comparable performance
- The presence of tube settlers in the sedimentation basin impedes maintenance activities
- A permanent pool of water is maintained in the MCTT, which increases vector concerns

Wet Basin/Pond

Description

A Wet Basin holds a permanent pool of water designed to detain and treat a runoff water quality volume. The basin supports plant species that provide constituent removal by biological processes. In addition, the vegetation may help reduce erosion of the side slopes and trap sediments. Sedimentation processes also occur in the basin. Wet basins are usually deep enough to prevent resuspension of particles, and should be sited where a permanent flow of water can be maintained from a dry weather flow source. In some references, this BMP is referred to as a "wet pond."

Constituent Removal

Constituent Group	Removal Efficiency	Level of Confidence
Total Suspended Solids (TSS)	●	●
Total Nitrogen	◐	◐
Total Phosphorus	○	○
Pesticides	NA	
Total Metals	●	●
Dissolved Metals	◐	●
Microbiological	●	○
Litter	●	◐
Biochemical Oxygen Demand (BOD)	NA	
Total Dissolved Solids (TDS)	NA	

Rating Key for Constituent Removal Efficiency and Level of Confidence

● ◐ ○
High Medium Low

Notes:

Removal ratings and levels of confidence were based on an evaluation of a wet basin as part of the Caltrans BMP Retrofit Pilot Program Study (2004). Average nitrate concentration from discharges after storm events was 132% greater than stormwater influent, however dry weather flow reductions caused a net annual removal of total nitrogen. The litter removal efficiency rating is based on best professional judgment.

Caltrans Evaluation Status

Approved

Schematic

Source: Caltrans

Key Design Elements

- Drawdown time
- Length width ratio
- Depth (deeper reduces maintenance of emerged vegetation)
- Permanent pool to capture volume ratio
- Basin side slopes
- Sedimentation forebay
- Vegetation selection
- Liner requirements
- Caltrans designers should follow the Project Planning and Design Guide (Caltrans 2007)

Benefit ↑	Benefit ↑
Cost ↓	Cost ↑
Benefit ↓	Benefit ↓
Cost ↓	Cost ↑

Rating Key for Cost Effectiveness Level of Confidence

● ◐ ○
High Medium Low

Notes:

Maintenance Issues

Requirements:

- Sensitive species inspections
- Vegetation removal to maintain efficacy of mosquito fish
- Sediment removal (hand removal with machetes was found to be more cost-effective than mechanical removal)
- Vector control or abatement

Special Training:

None identified

Project Development Issues

Right-of-Way Requirements:

Space requirements are high for wet basins

Siting Constraints:

- A wet basin usually has an area of 1 to 3 percent of the contributing drainage area
- Soil should have a low infiltration rate or be lined with a clay or geotextile liner so that water level is maintained in the basin
- Wet basins should be sited where a permanent pool of water can be maintained from a dry weather flow source

Construction:

- Excavated soil surface should be suitable to support plant life
- If a pond liner is used, it must be carefully constructed to avoid punctures

Advantages

- High removal efficiencies for many constituents
- Recreational and aesthetic benefits

Constraints

- There are potential problems associated with mosquitoes and the device may become a regulated wetland if not consistently maintained per an established schedule
- A permanent pool of water must be maintained and therefore may have limitations on siting
- Wet basins are larger than extended detention basins

RECEIVED MAR 30 1999

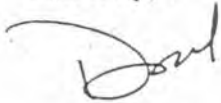

Deb Smith
Environmental Program Manager
California Regional Water Quality Control Board
101 Centre Plaza Drive
Monterey Park, CA 91754

Dear Deb:

We wanted to let you know that the court approved the Consent Decree in Heal the Bay, Inc.; Santa Monica BayKeeper, Inc. v. Browner, Case No. 98-4825 SBA on March 22, 1999.

We have enclosed a copy with attachments. If you have any questions, please feel to call either one of us.

Sincerely,

David S. Beckman
Alex N. Helperin

UNITED STATES DISTRICT COURT
FOR THE NORTHERN DISTRICT OF CALIFORNIA

ORIGINAL
FILED

MAR 23 1999

HEAL THE BAY, INC., SANTA MONICA
BAYKEEPER, INC., and TERRY TAMMINEN,

Plaintiffs,

v.

CAROL BROWNER, Administrator of the
United States Environmental
Protection Agency, FELICIA MARCUS,
Regional Administrator of the United
States Environmental Protection
Agency, Region IX, and the UNITED
STATES ENVIRONMENTAL PROTECTION
AGENCY,

Defendants.

RECEIVED MAR 30 1999
RICHARD W. WIEKING
CLERK, U.S. DISTRICT COURT
NORTHERN DISTRICT OF CALIFORNIA
OAKLAND
No. C 98-4825 SBA

AMENDED CONSENT DECREE

A. WHEREAS, Heal the Bay, Inc., Santa Monica BayKeeper, Inc., and Terry Tamminen (collectively, "Plaintiffs") filed a complaint in this action ("Complaint") against Defendants Carol Browner, in her official capacity as the Administrator of the United States Environmental Protection Agency; Felicia Marcus, in her official capacity as Regional Administrator of the United States Environmental Protection Agency, Region IX; and the United States Environmental Protection Agency (collectively, "EPA"), pursuant to, inter alia, Section 303(d) of the Clean Water Act ("Act" or "CWA"), 33 U.S.C. 1313(d);

B. WHEREAS, Section 303(d) of the Act and EPA's implementing regulations, 40 CFR 130.7(b)-(e), provide for, among other

AMENDED CONSENT DECREE:

Heal the Bay, Santa Monica BayKeeper, et al. v. Browner, et al.

1
2 things: (1) identification of waters for which applicable
3 technology-based effluent limitations and other required controls
4 are not stringent enough to implement water quality standards;
5 (2) establishment of a priority ranking for such waters; and
6 (3) establishment of total maximum daily loads ("TMDLs") for
7 those waters;

8 C. WHEREAS, the subject of this action concerns EPA's
9 alleged duty to either approve or disapprove TMDLs submitted to
10 EPA by the State of California ("State") for waters in that
11 region of the State administered by the Los Angeles Regional
12 Water Quality Control Board (hereinafter referred to as the "Los
13 Angeles Region"), and certain related claims, as set forth in the
14 Complaint filed herewith. The geographic boundaries of the Los
15 Angeles Region are set forth in Attachment 1 hereto;

16 D. WHEREAS, overall, storm water and urban runoff constitute
17 the most significant sources of pollution to the waters of the
18 Los Angeles Region. However, these sources of pollution have not
19 been sufficiently controlled to date;

20 E. WHEREAS, storm water and urban runoff in the Los Angeles
21 Region contain high levels of pollutants of concern, including,
22 but not limited to, heavy metals, sediment, nutrients, and
23 pathogens;

24 **AMENDED CONSENT DECREE:**

Heal the Bay, Santa Monica BayKeeper, et al. v. Browner, et al.

1 F. WHEREAS, the establishment of total maximum daily loads
2 must account for, among other things, all significant sources of
3 pollutants, including pollutants in storm water and urban runoff,
4 and, accordingly, the parties agree to direct attention to
5 reducing these significant sources of pollutants to the waters of
6 the Los Angeles Region;

7 G. WHEREAS, "water quality standards" ("WQS") has the
8 meaning provided at 40 CFR 130.2(d) and 130.3 as codified as of
9 the Effective Date of this Amended Consent Decree ("Consent
10 Decree") or as subsequently amended;

11 H. WHEREAS, 40 CFR 130.7(b)(3) states that the terms "water
12 quality standard applicable to such waters" and "applicable water
13 quality standards" refer to those water quality standards
14 established under Section 303 of the Act, including numeric
15 criteria, narrative criteria, waterbody uses and anti-degradation
16 requirements;

17 I. WHEREAS, 40 CFR 122.26(b)(13) defines "storm water" to
18 mean "storm water runoff, snow melt runoff, and surface runoff
19 and drainage."

20 J. WHEREAS, 40 CFR 122.1(b)(2) provides, in part, that
21 "[d]ischarges of storm water as set forth in § 122.26" are "point
22 sources requiring NPDES permits for discharges;"

23
24 AMENDED CONSENT DECREE:

Heal the Bay, Santa Monica BayKeeper, et al. v. Browner, et al.

1 K. WHEREAS, 40 CFR 130.2(h) defines "Wasteload allocation
2 (WLA)," in part, as "[t]he portion of a receiving water's loading
3 capacity that is allocated to one of its existing or future point
4 sources of pollution."

5 L. WHEREAS, in order to resolve this lawsuit, the parties
6 also have entered into an Amended Settlement Agreement
7 ("Settlement Agreement") which has been filed separately with the
8 Court; its terms are not incorporated into this Consent Decree;

9 M. WHEREAS, the parties have agreed to a settlement of this
10 action without an admission of fact or law, which they consider
11 to be a just, fair, adequate and equitable resolution of the
12 claims raised in this action;

13 N. WHEREAS, in particular, Plaintiffs state that their
14 consent to this Consent Decree is predicated upon facts
15 including, without limitation, that the Consent Decree provides
16 for remedies that will be implemented without delay, including
17 the near-term establishment of TMDLs to remedy critical water-
18 quality related environmental and public health problems;

19 O. WHEREAS, therefore, the parties understand that,
20 notwithstanding any other provision herein, if the Consent Decree
21 is not approved for any reason within 90 days of submission,
22 Plaintiffs may withdraw their consent to entry of the Consent
23 Decree; thereafter, neither the Consent Decree nor Plaintiffs'

24 AMENDED CONSENT DECREE:

Heal the Bay, Santa Monica BayKeeper, et al. v. Browner, et al.

1 agreement to lodge it shall preclude Plaintiffs from litigating
2 claims including those asserted in the Complaint and seeking
3 whatever remedy may be consistent with law. In any such
4 litigation, EPA reserves all of its defenses, and the parties
5 agree that the Consent Decree may not be used in support of any
6 fact or matter of law.

7 P. WHEREAS, it is in the interest of the public, the parties
8 and judicial economy to resolve the issues in this action without
9 protracted litigation, including a trial; and

10 Q. WHEREAS, the Court finds that this Consent Decree
11 represents a just, fair, adequate and equitable resolution of the
12 claims raised in this action.

13 NOW, THEREFORE, it is hereby ORDERED, ADJUDGED AND DECREED
14 as follows:

15 GENERAL TERMS

16 1. The obligations arising under this Consent Decree are
17 to be performed by EPA and not by Carol Browner or Felicia Marcus
18 in their respective individual capacities. This Consent Decree
19 applies to, is binding upon, and inures to the benefit of
20 Plaintiffs (and their successors, assigns, and designees) and of
EPA.

21 2. For the purposes of this Consent Decree,

22 a. "Water Quality Limited Segment" ("WQLS") has the
23 meaning provided at 40 CFR 130.2(j), as codified as of the

24 AMENDED CONSENT DECREE:

Heal the Bay, Santa Monica BayKeeper, et al. v. Browner, et al.

1 Effective Date of this Consent Decree or as subsequently amended;

2 b. "Total Maximum Daily Load" ("TMDL") has the meaning
3 provided at 33 U.S.C. Section 1313(d) and 40 CFR 130.2(i), as
4 codified as of the Effective Date of this Consent Decree or as
5 subsequently amended. A TMDL shall be established with "a margin
6 of safety which takes into account any lack of knowledge
7 concerning the relationship between effluent limitations and
8 water quality", pursuant to 33 U.S.C. 1313(d)(1)(C). A TMDL
9 "shall be established at a level necessary to implement the
10 applicable water quality standards with seasonal variations",
11 pursuant to 33 U.S.C. 1313(d)(1)(C);

12 c. "TMDL Analytical Unit" means a group, listed in
13 Attachment 2, of related WQLSs and associated pollutants for
14 which TMDLs will be developed;

15 d. "Effective Date" means the date upon which this
16 Consent Decree is entered by the Court; and

17 e. "Continuing planning process" ("CPP") has the
18 meaning provided at Section 303(e) of the CWA, 33 U.S.C. 1313(e),
19 and at 40 CFR 130.5, as codified as of the Effective Date of this
20 Consent Decree or as subsequently amended.

21 ESTABLISHMENT OF TMDLS

22 3. The parties understand that California has the initial
23 opportunity pursuant to Section 303(d) of the Act to adopt and
24 submit to EPA for approval TMDLs to be established under this
Consent Decree. However, EPA agrees to ensure that a TMDL will
be completed for each and every pairing of a WQLS and an
associated pollutant in the Los Angeles Region set forth in

AMENDED CONSENT DECREE:

Heal the Bay, Santa Monica BayKeeper, et al. v. Browner, et al.

1 Attachment 2 (incorporated herein as if set forth in full, and
2 referred to herein as "the List of Waters and Pollutants Covered
3 by the Consent Decree") by completing the following:

4 (a) Schedule for Specified Waters. With respect to each
5 and every pairing of a WQLS and an associated pollutant set forth
6 in each TMDL Analytical Unit identified in the "Schedule for
7 Specified Waters" (Attachment 3, incorporated herein as if set
8 forth in full), EPA shall either:

9 (i) approve a TMDL submitted by the State by the
10 date identified in Attachment 3, or

11 (ii) if EPA has not approved a TMDL by the date
12 identified in Attachment 3, establish a TMDL within one (1) year
13 after the date identified in Attachment 3, unless the State
14 submits and EPA approves a TMDL prior to EPA establishing the
15 TMDL within EPA's one year backstop period; and

16 (b) Minimum Pace Requirement. EPA shall assure that a
17 minimum pace for TMDL development is achieved by either, (i)
18 approving, by the following deadlines, a TMDL for each and every
19 pairing of a WQLS and an associated pollutant set forth in the
20 following aggregate number of "TMDL Analytical Units" (Attachment
21 2) submitted by the State:

<u>Date</u>	<u>Cumulative</u> <u>TMDL Analytical Units</u>
1 year after the Effective Date	1
2 years " " " "	4
3 years " " " "	9
4 years " " " "	14

24 AMENDED CONSENT DECREE:

6	10 years	"	"	"	"	44
7	11 years	"	"	"	"	53
8	12 years	"	"	"	"	58;

8 or, (ii) establishing, within one (1) year of each deadline set
9 forth above, a TMDL for each and every pairing of a WQLS
10 and an associated pollutant needed to complete the aggregate
11 number of TMDL Analytical Units required for that deadline,
12 unless the State submits and EPA approves a TMDL prior to EPA
13 establishing the TMDL within EPA's one year backstop period; and

14 (c) Final Deadline. By thirteen (13) years after the
15 Effective Date, approve or establish a TMDL for each and every
16 remaining pairing of a WQLS and an associated pollutant in the
17 Los Angeles Region set forth in the List of Waters and Pollutants
18 Covered by the Consent Decree (Attachment 2). If EPA finds it
19 necessary to utilize year thirteen (13) of this schedule to
20 satisfy this obligation, EPA shall assure that TMDLs approved or
21 established in year thirteen (13) are for low priority WQLSs
22 covered by this Consent Decree, TMDLs for higher priority WQLSs
23 covered by this Consent Decree having been approved or
24 established in years one (1) through twelve (12) of the schedule.
"Low priority" and "higher priority" herein refer to priorities
set forth in the California 1998 Section 303(d) List, as approved

1 by EPA, October, 1998, although the inclusion of one or more
2 "low" priority WQLS(s) and associated pollutant(s) in an
3 Analytical Unit contained in Attachment 3 is not intended to
4 affect, nor affects, the schedule required therein.

5 4. Where the parties mutually consent to any revision of
6 Attachments 2 and/or 3, such revision shall be effected by
7 written agreement submitted to the Court for approval, except for
8 extensions of sixty (60) days or less, which revision may be
9 effected by written agreement of the parties and notice to the
10 Court.

11 MEASURING COMPLIANCE WITH TMDL DEADLINES

12 5. The approval or establishment by EPA of a TMDL for each
13 and every pairing of a WQLS and an associated pollutant listed
14 within any TMDL Analytical Unit counts as completion of that TMDL
15 Analytical Unit for purposes of compliance with subparagraph
16 3(b), above. By way of illustration and example, credit under
17 paragraph 3(b) of the Consent Decree for completion of TMDL
18 Analytical Unit # 7 accrues when EPA approves or establishes 5
19 TMDLs: one TMDL for PCBs for each of the 5 listed WQLSs in TMDL
20 Analytical Unit # 7. Where a deadline for a specified TMDL
21 Analytical Unit is provided in Attachment 3, the approval or
22 establishment by EPA of a TMDL for each and every pairing of a
23 WQLS and an associated pollutant listed within that specified
24 TMDL Analytical Unit counts as completion of the specified TMDL
Analytical Unit for purposes of subparagraph 3(a), above, and
also for purposes of the milestones required by paragraph 3(b).
By way of illustration and example, credit under paragraph 3(a)

AMENDED CONSENT DECREE:

Heal the Bay, Santa Monica BayKeeper, et al. v. Browner, et al.

1 of the Consent Decree for completion of TMDL Analytical Unit # 56
2 accrues when EPA approves or establishes 3 TMDLs: 1 TMDL for
3 lead (Pb), 1 TMDL for copper (Cu), and 1 TMDL for zinc (Zn) for
4 the listed WQLS, Marina del Rey Harbor - Back Basins.

5 Thereafter, this TMDL Analytic Unit also counts toward the
6 milestones required by paragraph 3(b).

7 6. EPA and the Plaintiffs understand that future
8 Section 303(d) Lists for the Los Angeles Region may include
9 additional WQLSs or pollutants ("Additional WQLSs or Pollutants")
10 that may warrant TMDL development prior to TMDL development for
11 some WQLSs or pollutants listed in Attachment 2. EPA's
12 obligation, if any, with respect to such Additional WQLSs or
13 Pollutants is not within the scope of this Consent Decree.
14 However, to the extent that EPA seeks credit under the Consent
15 Decree for completing a TMDL for an Additional WQLS or Pollutant,
16 it must follow the procedure described in Paragraph 7 to obtain
17 such credit.

18 7. After obtaining Plaintiffs' written agreement, which
19 consent Plaintiffs may at their sole discretion withhold, EPA
20 may, after Court approval, substitute one or more such Additional
21 WQLSs or Pollutants for an agreed upon number of WQLSs or
22 pollutants set forth in Attachment 2 and, after approving or
23 establishing a TMDL for each such Additional WQLS or Pollutant,
24 EPA may count that approved or established TMDL, in accordance
with the parties' agreement, for purposes of compliance with the
milestones contained in this Consent Decree. No implication

AMENDED CONSENT DECREE:

Heal the Bay, Santa Monica BayKeeper, et al. v. Browner, et al.

1 shall be drawn as a result of Plaintiffs' rejection of a request
2 to substitute Additional WQLSs or Pollutants.

3 8. In fulfilling its obligations under this Consent
4 Decree, EPA is under no obligation to establish TMDLs for any
5 pairing of a WQLS and a pollutant that EPA determines for
6 purposes of this Decree only, consistent with Section 303(d) of
7 the Act and its implementing regulations, including 40 CFR
8 130.7(b), as codified as of the Effective Date of this Consent
9 Decree or as subsequently amended, does not require a TMDL or
10 which has been removed after the Effective Date from an EPA
11 approved California Section 303(d) list of waters requiring TMDLs
12 pursuant to Section 303(d)(1) of the Act, consistent with the
13 provisions of the Act and EPA's implementing regulations.

14 Accordingly, if it complies with the notification procedure
15 required by paragraph 9 of this Consent Decree, for the purposes
16 of measuring EPA's compliance with the milestones described in
17 paragraph 3, EPA may also count toward TMDL development any
18 pairing of a WQLS and a pollutant set forth in Attachments 2:

19 (i) after it is removed from a Section 303(d) list of waters
20 requiring a TMDL pursuant to Section 303(d)(1) (approved by EPA
21 after the Effective Date); or (ii) after EPA determines for
22 purposes of this Decree only, consistent with Section 303(d) and
23 40 CFR 130.7, as codified as of the Effective Date or this
24 Consent Decree or as subsequently amended, that a TMDL is not
required.

25 9. If EPA makes a determination pursuant to paragraph
26 8(ii) of the Consent Decree that a TMDL is not required for any

AMENDED CONSENT DECREE:

Heal the Bay, Santa Monica BayKeeper, et al. v. Browner, et al.

1 pairing of a WQLS and a pollutant, EPA shall notify Plaintiffs
2 within thirty (30) days of EPA's determination and provide
3 Plaintiffs with the basis for its determination. EPA's
4 determination under paragraph 8(ii) is not a final agency action
5 subject to review independent of this Consent Decree. However,
6 if Plaintiffs do not concur with EPA's determination under
7 paragraph 8(ii), EPA agrees that the Court may solely for
8 purposes of determining EPA's compliance with the requirements of
9 paragraph 3 of this Consent Decree, and pursuant to a request by
10 Plaintiffs under paragraph 23 of the Consent Decree ("Dispute
11 Resolution"), review the record of EPA's determination under
12 paragraph 8(ii) and decide whether or not EPA's determination is
13 consistent with the Clean Water Act and its implementing
14 regulations, including 40 CFR 130.7, as codified as of the
15 Effective Date of this Consent Decree or as subsequently amended.
16 If the Court disapproves EPA's determination under paragraph
17 8(ii), then within six (6) months after that ruling (or if the
18 pairing of a WQLS and an associated pollutant is listed on
19 Attachment 3, then the later of six (6) months after the ruling
20 or the date the TMDL is scheduled to be complete), EPA shall
21 either: (i) approve a state established TMDL for each pairing of
22 a WQLS and an associated pollutant at issue or (ii) establish a
23 TMDL for each pairing of a WQLS and an associated pollutant at
24 issue.

TMDL PROGRESS REPORTS AND DOCUMENTATION

10. Beginning one year after the Effective Date and
continuing every year thereafter until fourteen (14) years after

AMENDED CONSENT DECREE:

Heal the Bay, Santa Monica BayKeeper, et al. v. Browner, et al.

1 the Effective Date, EPA shall provide Plaintiffs, and any
2 interested party upon written request, with an annual written
3 progress report covering the one-year period just ended. Each
4 report shall be provided within ninety (90) days after the end of
5 the period that is the subject of the progress report, and with
6 respect to the Los Angeles Region shall identify:

7 a. the TMDLs submitted by the State during the
8 reporting period, the date of each submission, EPA action taken
9 on each submission and the date of the action taken;

10 b. the TMDLs that EPA established during the reporting
11 period; and

12 c. all WQLSs, and pollutants associated with each WQLS,
13 that are on the 1998 Section 303(d) list that are not included on
14 the most recent EPA approved Section 303(d) lists or which EPA
15 determined consistent with Section 303(d) and 40 CFR 130.7, as
16 codified as of the Effective Date of this Consent Decree or as
17 subsequently amended, do not need a TMDL.

18 11. Six (6) months after the Effective Date, and annually
19 thereafter for each of the next three (3) years, EPA shall by
20 conference call inform Plaintiffs of the general status of
21 actions to comply with the Consent Decree, including TMDLs
22 submitted, EPA action taken on each submission and the date of
23 that action, TMDLs approved or established by EPA, and all WQLSs
24 (and pollutants associated with those WQLSs) that are on the 1998
Section 303(d) list that are not included on the most recent EPA
approved Section 303(d) list or which EPA determined consistent
with Section 303(d) and 40 CFR 130.7, as codified as of the

AMENDED CONSENT DECREE:

Heal the Bay, Santa Monica BayKeeper, et al. v. Browner, et al.

1 Effective Date of this Consent Decree or as subsequently amended,
2 do not need TMDLs.

3 12. These provisions do not limit Plaintiffs' rights under
4 the Freedom of Information Act or other public information
5 provisions of law.

6 CONTINUING PLANNING PROCESS

7 13. By three (3) months from the Effective Date:

8 a. EPA will provide Plaintiffs a copy of the State's
9 Continuing planning process ("CPP");

10 b. EPA will keep at EPA Region IX a copy of the most
11 recent State CPP reviewed by EPA for public review during the
12 pendency of this Consent Decree; and

13 c. EPA will publish in the Federal Register a notice
14 informing the public that: the CPP is available for public
15 review; that by six months from entry of the Consent Decree EPA
16 will prepare and make available to interested parties upon
17 request for their review and comment EPA's preliminary written
18 summary of its review of that portion of the CPP related to the
19 Section 303(d) program; and interested parties may request copies
20 of the CPP and EPA's preliminary written summary when available.

21 14. By six (6) months from the Effective Date, EPA will:

22 (a) review that portion of the CPP related to the Section 303(d)
23 program to determine whether it is consistent with Section 303(e)
24 of the Act, 33 U.S.C. 1313(e), and EPA's implementing regulations
at 40 CFR 130.5, as codified as of the Effective Date or as
subsequently amended; (b) prepare a preliminary written summary
of its review, including any recommendations for improvement;

AMENDED CONSENT DECREE:

Heal the Bay, Santa Monica BayKeeper, et al. v. Browner, et al.

1 (c) provide the preliminary written summary to the Plaintiffs and
2 the State for comment; and (d) make the preliminary written
3 summary available for comment to other parties upon written
4 request. EPA will consider any comments on the preliminary
5 written summary submitted not later than forty-five (45) days
6 after the preliminary written summary is provided to the
7 Plaintiffs and the State for comment.

8 15. By nine (9) months from the Effective Date, EPA will
9 determine whether that portion of the CPP related to the Section
10 303(d) program is consistent with the Act and its implementing
11 regulations, and it will provide Plaintiffs and the State, and
12 any other interested persons upon request, with a final written
13 summary of EPA's review of the CPP that will include any
14 recommendations for improvement.

15 16. If the State does not modify its CPP to be consistent
16 with any EPA recommendations, the Act and its implementing
17 regulations, EPA shall take appropriate action as provided under
18 the Act and accompanying regulations.

19 REPORT REGARDING MONITORING, ASSESSMENT AND LISTING

20 17. By one (1) year from the Effective Date, EPA will
21 develop a final report evaluating and making any recommendations
22 regarding the Los Angeles Regional Water Quality Control Board's
23 water quality monitoring and assessment program and
24 Section 303(d) listing process. At least sixty (60) days prior
to finalizing the report, EPA will provide a preliminary copy of
the report to Plaintiffs and the Los Angeles Regional Water
Quality Control Board for comment. At that same time EPA will

AMENDED CONSENT DECREE:

Heal the Bay, Santa Monica BayKeeper, et al. v. Browner, et al.

1 make a copy available for comment to other interested parties
2 upon prior written request. EPA will consider any comments on
3 the preliminary report submitted not later than forty-five (45)
4 days after the preliminary report is provided to Plaintiffs and
5 the Los Angeles Regional Water Quality Control Board for comment.

6 18. EPA will consider the final report, among other things,
7 to be existing and readily available water quality-related
8 information to be used in reviewing the next State Section 303(d)
9 list for the Los Angeles Region submitted after the Effective
10 Date of this Decree and for determining whether that list can be
11 approved under CWA Section 303(d) and EPA's implementing
12 regulations.

13 FORCE MAJEURE

14 19. The possibility exists that circumstances outside the
15 reasonable control of EPA could delay compliance with the
16 timetables contained in this Consent Decree. Such circumstances
17 may include, but are not limited to, catastrophic environmental
18 events requiring immediate and/or time-consuming response by EPA.
19 In addition, the parties recognize that the performance of the
20 Consent Decree is subject to fiscal and procurement laws and
21 regulations of the United States, which include, but are not
22 limited to, the Anti-Deficiency Act, 31 U.S.C. §§ 1341, et seq.
23 ("ADA"). Circumstances where the expenditure of funds may violate
24 the ADA and/or fiscal and procurement laws and regulations of the
United States include, but are not limited to, sufficient funds
not being appropriated as requested or appropriated funds not
being available for expenditure. Should a delay occur due to

AMENDED CONSENT DECREE:

Heal the Bay, Santa Monica BayKeeper, et al. v. Browner, et al.

1 force majeure circumstances, any resulting failure to meet the
2 timetables set forth herein shall not constitute a failure to
3 comply with the Consent Decree. EPA will provide notice to the
4 Plaintiffs after EPA becomes aware of the need for such delay,
5 and will provide Plaintiffs with an explanation of EPA's basis
6 for invoking this term. Plaintiffs may challenge the invocation
7 of this term of the Consent Decree under the dispute resolution
8 terms of this Consent Decree, and EPA shall bear the burden of
9 justifying its invocation of this term.

10 MODIFICATIONS AND EXTENSIONS

11 20. Any dates set forth in this Consent Decree may be
12 extended by written agreement of the parties and notice to the
13 Court. To the extent the parties are not able to agree to an
14 extension, either party may seek a modification to the Consent
15 Decree for good cause shown and in accordance with the procedures
16 specified below:

17 a. If a party files a motion requesting modification of
18 a date or dates established by the Consent Decree and provides
19 notice to the other party at least thirty (30) days prior to
20 filing such motion, and files the motion at least sixty (60) days
21 prior to the date for which modification is sought, then the
22 filing of such motion shall, upon request, automatically extend
23 the date for which modification is sought. Such extension shall
24 remain in effect until the earlier to occur of (i) a dispositive
ruling by the Court on such motion, (ii) the date sought in the
modification, or (iii) sixty (60) days after the original date
for which modification is sought. The party may move the Court

AMENDED CONSENT DECREE:

Heal the Bay, Santa Monica BayKeeper, et al. v. Browner, et al.

1 for a longer extension. In the absence of a dispositive ruling
2 from the Court, only one such automatic stay shall be permitted
3 for each deadline for which modification is sought.

4 b. If a party files a motion requesting modification of
5 a date or dates established by the Consent Decree totaling thirty
6 (30) days or less, provides notice to the other party at least
7 thirty (30) days prior to the filing of such motion, and files
8 the motion at least seven (7) days prior to the date for which
9 modification is sought, then the filing of such motion shall,
10 upon request, stay the date for which modification is sought.
11 Such stay shall remain in effect until the earlier to occur of
12 (i) a dispositive ruling by this Court on such motion, or (ii)
13 the date sought in the modification. In the absence of a
14 dispositive ruling from the Court, only one such automatic stay
15 shall be permitted for each deadline for which modification is
16 sought.

17 c. If a party seeking modification does not provide
18 notice pursuant to subparagraphs a. or b., above, that party may
19 move the Court for a stay of the date for which modification is
20 sought. The party seeking modification under this subparagraph
21 shall give notice to the other party as soon as possible of its
22 intent to seek a modification and/or stay of the date sought to
23 be modified.

24 d. Any motion to modify the schedule established in
this Consent Decree shall be accompanied by a motion for
expedited consideration.

AMENDED CONSENT DECREE:

Heal the Bay, Santa Monica BayKeeper, et al. v. Browner, et al.

1 21. Nothing in this Consent Decree shall be construed to
2 limit the equitable powers of the Court to modify the Consent
3 Decree's terms upon a showing of good cause by any party. Good
4 cause may include, but is not limited to, changes in the law,
5 including implementing regulations, affecting EPA's actions
6 under this Consent Decree.

7 CONTINUING JURISDICTION

8 22. The Court retains jurisdiction for the purposes of
9 resolving any disputes arising under this Consent Decree, and
10 issuing such further orders or directions as may be necessary or
11 appropriate to construe, implement, modify or enforce the terms
12 of this Consent Decree, and for granting any further relief as
13 the interests of justice may require.

14 DISPUTE RESOLUTION

15 23. In the event of a disagreement between the parties
16 concerning the interpretation or performance of any aspect of the
17 Consent Decree (including requirements related to the CPP), the
18 dissatisfied party shall provide the other party with written
19 notice of the dispute and a request for negotiations. The
20 parties shall meet and confer in order to attempt to resolve the
21 dispute within thirty (30) days of the written notice, or such
22 time thereafter as is mutually agreed upon. If the parties are
23 unable to resolve the dispute within sixty (60) days of such
24 meeting, or such time thereafter as may be mutually agreed, then
either party may petition the Court to resolve the dispute.

AMENDED CONSENT DECREE:

Heal the Bay, Santa Monica BayKeeper, et al. v. Browner, et al.

1 JUDICIAL REVIEW, AND COMPLIANCE WITH OTHER LAWS

2 24. Nothing in the Consent Decree shall be construed to
3 confer upon this Court jurisdiction to review any decision,
4 either procedural or substantive, to be made by EPA pursuant to
5 the Consent Decree, except for the purpose of determining EPA's
6 compliance with the Consent Decree. Plaintiffs reserve their
7 rights to challenge, where necessary in a separate lawsuit, the
8 merits of any action taken by EPA pursuant to this Decree. EPA
9 reserves all of its rights and defenses to any such action.
10 Except as provided herein, nothing in the Consent Decree shall
11 limit or modify the discretion accorded EPA by the Clean Water
12 Act or by general principles of administrative law, including
13 EPA's discretion to alter, amend, or revise from time to time any
14 actions taken by EPA pursuant to the Consent Decree, or to
15 promulgate superseding regulations. Plaintiffs reserve their
16 rights to challenge, where necessary in a separate lawsuit, such
17 exercise of discretion or promulgation of superseding regulations
18 by EPA. EPA reserves all of its rights and defenses to any such
19 action.

20 25. Nothing in the Consent Decree relieves EPA of the
21 obligation to act in a manner consistent with other applicable
22 Federal, State or local law, including the notice and comment and
23 other provisions of the Administrative Procedure Act, 5 U.S.C.
24 §§ 551-599, 701-706. No provision of the Consent Decree shall
constitute a commitment that EPA obligate or pay funds in
contravention of the Anti-Deficiency Act, 31 U.S.C. § 1341, and
other applicable appropriations law or regulation.

14 Upon written notice to the other parties, any party may designate
15 a successor contact person for any matter relating to the Consent
16 Decree.

17 REPRESENTATIVE AUTHORITY

18 27. Each undersigned representative of a party to the
19 Consent Decree certifies that he or she is fully authorized by
20 the party to enter into and execute the terms and conditions of
21 the Consent Decree, and to legally bind such party to the Consent
22 Decree. By the signatures below, all of the Plaintiffs and EPA
23 consent to entry of this Consent Decree.

24 SECURING COURT APPROVAL

25 28. Upon signature of each undersigned representative of
26 each party to this Consent Decree, Plaintiffs and EPA agree to
27 join in and support such legal proceedings as necessary to secure
28 the Court's timely approval and entry of this Consent Decree.

SEVERABILITY

29. If any provision of the Consent Decree is deemed invalid or unenforceable, the balance of the Consent Decree shall remain in full force and effect.

ENTIRE AGREEMENT

30. This Consent Decree and the Settlement Agreement are the entire agreement between Plaintiffs and EPA in this case. All prior conversations, meetings, discussions, drafts and writings of any kind are specifically superseded by this Consent Decree and the Settlement Agreement.

MUTUAL DRAFTING

31. It is hereby expressly understood and agreed that this Consent Decree was jointly drafted by Plaintiffs and EPA. Accordingly, the parties hereby agree that any and all rules of construction to the effect that ambiguity is construed against the drafting party shall be inapplicable in any dispute concerning the terms, meaning, or interpretation of this Consent Decree.

COUNTERPARTS

32. This Consent Decree may be executed in any number of counterpart originals, each of which shall be deemed to constitute an original agreement, and all of which shall constitute one agreement. The execution of one counterpart by a party's undersigned representative shall have the same force and effect as if that undersigned representative had signed all other counterparts.

RELEASE BY PLAINTIFFS

34. Upon entry by the Court of the Consent Decree, the Consent Decree and accompanying Settlement Agreement shall constitute a final resolution between Plaintiffs and EPA of all counts of the Complaint. Except for claims which may arise under the provisions of the Consent Decree and/or the Settlement Agreement, and/or claims that are reserved by provisions of the Consent Decree (including without limitation paragraph 35) and/or the Settlement Agreement, Plaintiffs hereby release, discharge, and covenant not to assert (by way of the commencement of an action, the joinder of EPA in an existing action or in any other fashion) any and all claims, causes of action, suits or demands of any kind whatsoever in law or in equity which it may have had, or may now or hereafter have, against EPA based upon matters which have been asserted in the Complaint.

RESERVATION OF RIGHTS

35. This Consent Decree and the Settlement Agreement do not waive or limit in any way Plaintiffs' rights except as expressly provided therein. Nothing in the Consent Decree or Settlement Agreement shall be construed to waive or limit any right to challenge or file suit on matters including, but not limited to, (1) California's 1998 or subsequent Section 303(d) Lists, whether such Section 303(d) Lists are prepared by California or by EPA; (2) any TMDLs, whether such TMDLs are established by California or by EPA, and/or TMDL implementation; (3) non-TMDL CWA obligations, such as the issuance, reissuance, modification, or revocation and reissuance of NPDES permits; or (4) the failure to establish TMDLs for waters and/or pollutants outside the Los Angeles Region or for Additional WQLSs or Pollutants in the Los Angeles Region. EPA reserves all of its claims and defenses in any such action.

USE OF CONSENT DECREE

36. This Consent Decree shall not constitute an admission or evidence of any fact, wrongdoing, misconduct, or liability on the part of the United States, its officers, or any person affiliated with it.

APPLICABLE LAW

37. This Consent Decree shall be governed and construed under the laws of the United States.

THIRD-PARTY BENEFICIARIES

38. Nothing in this Consent Decree shall be construed to make any other person or entity not executing the Consent Decree a third-party beneficiary to the Consent Decree.

TERMINATION OF CONSENT DECREE AND DISMISSAL OF CLAIMS

39. The Consent Decree shall terminate after fulfillment of all the obligations of EPA under the Consent Decree. Upon termination of the Consent Decree, this case shall be dismissed with prejudice. EPA and Plaintiffs shall jointly file the appropriate notice with the Court so that the Clerk of the Court may close the file.

COSTS

40. EPA agrees that Plaintiffs are entitled to reasonable attorneys' fees and costs accrued as of the Effective Date of the Consent Decree and fees reasonably incurred in obtaining those fees. The parties shall make a good faith effort to reach agreement as to the appropriate amount of the recovery. If the parties cannot reach agreement, Plaintiffs shall file any request for attorneys' fees within ninety (90) days of the Effective Date of the Consent Decree. EPA shall have forty-five (45) days to respond to Plaintiffs' fee request. Nothing herein limits the right of Plaintiffs to seek recovery of reasonable attorneys' fees and costs for monitoring or enforcement of this Consent Decree after the Effective Date to the extent permitted by law, nor limits EPA's right to oppose any such request.

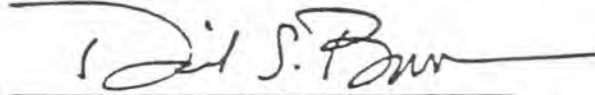

AMENDED CONSENT DECREE:

Heal the Bay, Santa Monica BayKeeper, et al. v. Browner, et al.

1 On behalf of the party or parties designated below, the
2 undersigned agree to the foregoing Consent Decree, and consent to
3 its entry as an order of the Court forthwith.

ORDER

UPON CONSIDERATION OF THE FOREGOING, the Court hereby finds that this Amended Consent Decree is fair and reasonable, both procedurally and substantively, consistent with applicable law, in good faith, and in the public interest. THE FOREGOING Amended Consent Decree is hereby APPROVED AND ENTERED AS FINAL JUDGMENT.

SIGNED and ENTERED this 22nd day of March, 1999.

SANDRA BROWN ARMSTRONG
JUDGE, UNITED STATES DISTRICT COURT

AMENDED CONSENT DECREE:
Heal the Bay, Santa Monica BayKeeper, et al. v. Browner, et al.

PROOF OF SERVICE

STATE OF CALIFORNIA)
) SS.
COUNTY OF LOS ANGELES)

I am employed in the County of Los Angeles, State of California. I am over the age of 18 and not a party to the within action. My business address is: 6310 San Vicente Boulevard, Suite 250, Los Angeles, California 90048.

On March 25, 1999 I served the following document described as **AMENDED CONSENT DECREE** on the interested parties in said action by placing a true copy thereof in the United States mail enclosed in a sealed envelope with postage prepaid addressed as follows:

Gary Hess
Office of Regional Counsel
United States Environmental Protection Agency
75 Hawthorne Street
San Francisco, CA 94105

S. Randall Humm
United States Department of Justice
Environment & Natural Resources Division
Environment Defense Section
P.O. Box 23986
Washington, D.C. 20026-3986

I am "readily familiar" with the firm's practice of collection and processing correspondence for mailing. It is deposited with U.S. postal service on that same day in the ordinary course of business. I am aware that on motion of party served, service is presumed invalid if postal cancellation date or postage meter date is more than 1 day after date of deposit for mailing in affidavit.

I declare that I am employed in the office of a member of the bar of this Court at whose direction the service was made.

Executed on March 25, 1999 at Los Angeles, California.

Virginia Calvano

ATTACHMENT J-10

Los Angeles Regional Water Quality Control Board

February 15, 2018

Mr. John Landgard, EH&S Manager
Sentinel Peak Resources California, LLC
Inglewood Oil Field
5640 South Fairfax Avenue
Los Angeles, CA 90056

Dear Mr. Landgard:

TRANSMITTAL OF WASTE DISCHARGE REQUIREMENTS (WDRs) AND NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) PERMIT AND TIME SCHEDULE ORDER – SENTINEL PEAK RESOURCES CALIFORNIA, LLC., INGLEWOOD OIL FIELD, LOS ANGELES, CALIFORNIA (NPDES NO. CA0057827, CI-6240)

On December 1, 2017, we transmitted you the tentative National Pollutant Discharge Elimination System (NPDES) Permit and the tentative Time Schedule Order (TSO) for the Inglewood Oil Field. After considering your comments submitted on January 5, 2018, we transmitted you the Response to Comments on January 29, 2018.

Pursuant to Division 7 of the California Water Code, this Regional Water Board at a public hearing held on February 8, 2018, reviewed the requirements in the tentative permit and the tentative TSO, considered all factors in the case, and adopted Order No. R4-2018-0020 for your waste discharge and Time Schedule Order No. R4-2018-0021. Order R4-2018-0020 serves as an NPDES permit, and it expires on March 31, 2023. Section 13376 of the California Water Code requires that an application/Report of Waste Discharge for a new permit must be filed at least 180 days before the expiration date.

Please note the following changes to the tentative requirements that were made by the Board during the hearing:

- The addition of Item iv in Section VI.C.3.a of the Order (page 20): The Discharger is required to submit a report to the Regional Board within 12 months of the effective date of this Order that analyzes the feasibility of implementing additional stormwater storage capacity to handle high-intensity storm events.

You are required to implement the Monitoring and Reporting Program (MRP) on the effective date (April 1, 2018) of Order No. R4-2018-0020. Your first quarterly monitoring report for the period of April 1, 2018 through June 30, 2018 is due by August 15, 2018. The semiannual progress report required by the TSO is also due by August 15, 2018.

Please continue to electronically submit Self-Monitoring Reports (SMRs) and the TSO semiannual progress reports using the State Water Resource Control Board's California Integrated Water Quality System (CIWQS) Program web site (<http://www.waterboards.ca.gov/ciwqs/index.html>). The CIWQS web site will provide additional information for SMR and the progress report submittal in the event there is a planned service interruption for electronic submittal. Please do not combine other reports with your monitoring reports. Submit each type of report as a separate document.

Please convert all of the regulatory documents, submissions and correspondence that you would normally submit to us as hard copies to a searchable Portable Document Format (PDF). Please reference Inglewood Oil Field, NPDES No. CA0057827 and Compliance File CI-6240 on the documents. Documents that are less than 10 megabytes (MB) should be emailed to losangeles@waterboards.ca.gov with a copy to JauRen.Chen@waterboards.ca.gov. Documents that are 10 MB or larger should be transferred to a disk and mailed to the address listed above. If you need additional information regarding electronic submittal of documents please visit the Regional Water Board's website listed above and navigate to Paperless Office.

If you have any questions, please contact Jau Ren Chen at (213) 576-6656.

Sincerely,

Cassandra Owens, Chief
Industrial Permitting Unit

I. FACILITY INFORMATION

Information describing Sentinel Peak Resources California, LLC, Inglewood Oil Field (Field or Facility) is summarized in Table 1 and in sections I and II of the Fact Sheet (Attachment F). Section I of the Fact Sheet also includes information regarding the Facility's permit application.

II. FINDINGS

The California Regional Water Quality Control Board, Los Angeles Region (Regional Water Board), finds:

- A. Legal Authorities.** This Order serves as waste discharge requirements (WDRs) pursuant to article 4, chapter 4, division 7 of the California Water Code (commencing with section 13260). This Order is also issued pursuant to section 402 of the federal Clean Water Act (CWA) and implementing regulations adopted by the U.S. EPA and chapter 5.5, division 7 of the Water Code (commencing with section 13370). It shall serve as a National Pollutant Discharge Elimination System (NPDES) permit authorizing the Discharger to discharge into waters of the United States at the discharge locations described in Table 2 subject to the WDRs in this Order.
- B. Background and Rationale for Requirements.** The Regional Water Board developed the requirements in this Order based on information submitted as part of the application, through monitoring and reporting programs, and other available information. The Fact Sheet (Attachment F), which contains background information and rationale for the requirements in this Order, is hereby incorporated into and constitutes Findings for this Order. Attachments A through E and G through J are also incorporated into this Order.
- C. Provisions and Requirements Implementing State Law.** The provisions/requirements in subsections IV.B, IV.C, and V.B are included to implement state law only. These provisions/requirements are not required or authorized under the federal CWA; consequently, violations of these provisions/requirements are not subject to the enforcement remedies that are available for NPDES violations.
- D. Notification of Interested Parties.** The Regional Water Board has notified the Discharger and interested agencies and persons of its intent to prescribe WDRs for the discharge and has provided them with an opportunity to submit their written comments and recommendations. Details of the notification are provided in the Fact Sheet.
- E. Consideration of Public Comment.** The Regional Water Board, in a public meeting, heard and considered all comments pertaining to the discharge. Details of the Public Hearing are provided in the Fact Sheet.

THEREFORE, IT IS HEREBY ORDERED that this Order supersedes Order No. R4-2013-0021 except for enforcement purposes, and, in order to meet the provisions contained in division 7 of the Water Code (commencing with section 13000) and regulations adopted thereunder, and the provisions of the CWA and regulations and guidelines adopted thereunder, the Discharger is authorized to discharge from the identified Facility and outfalls into waters of the United States, and shall comply with the requirements in this Order. This action in no way prevents the Regional Water Board from taking enforcement action for violations of the previous Order.

III. DISCHARGE PROHIBITIONS

- A.** Wastes discharged shall be limited to a maximum of 7.55 million gallons per day (MGD) of storm water (storm water runoff and construction storm water) through Discharge Points 001 through 006 as described in the Fact Sheet (Attachment F). The discharge of non-storm water (wastewater related to industrial activities) and wastes from accidental spills or other sources is prohibited.

- B. Discharges of water, materials, thermal wastes, elevated temperature wastes, toxic wastes, deleterious substances, or wastes other than those authorized by this Order, to a storm drain system, the Ballona Creek, or other waters of the State, are prohibited.
- C. Neither the treatment nor the discharge of pollutants shall create pollution, contamination, or a nuisance as defined by section 13050 of the Water Code.
- D. Wastes discharged shall not contain any substances in concentrations toxic to human, animal, plant, or aquatic life.
- E. The discharge shall not cause a violation of any applicable water quality standards for receiving waters adopted by the Regional Water Board or the State Water Resources Control Board (State Water Board) as required by the federal CWA and regulations adopted thereunder.
- F. The discharge of oil or any residuary product of petroleum to waters of the State, except in accordance with the waste discharge requirements or other provisions of Division 7 of the Water Code, is prohibited.
- G. The discharge of any radiological, chemical, or biological warfare agent into the waters of the state is prohibited under Water Code section 13375.
- H. The discharge of any product registered under the Federal Insecticide, Fungicide, and Rodenticide Act to any waste stream which may ultimately be released to waters of the United States, is prohibited unless specifically authorized elsewhere in this permit or another NPDES permit. This requirement is not applicable to products used for lawn and agricultural purposes.
- I. The discharge of any waste resulting from the combustion of toxic or hazardous wastes to any waste stream that ultimately discharges to waters of the United States is prohibited, unless specifically authorized elsewhere in this permit.
- J. Any discharge of wastes at any point(s) other than specifically described in this Order is prohibited, and constitutes a violation of the Order.
- K. The discharge of trash to surface waters of the State or the deposition of trash where it may be discharged into surface waters of the State is prohibited.

IV. EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

A. Effluent Limitations

1. Final Effluent Limitations – Discharge Point 001 (LAI Last Chance Basin)

- a. The Discharger shall maintain compliance with the following effluent limitations individually at Discharge Point 001, with compliance measured at Monitoring Location EFF-001 as described in the Monitoring and Reporting Program (Attachment E):

Table 4a. Effluent Limitations at Discharge Point 001 (LAI Last Chance Basin)

Parameter	Units	Effluent Limitations			
		Average Monthly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
Conventional Pollutants					
Biochemical Oxygen Demand (BOD) (5-day @ 20 deg. C)	mg/L	--	30	--	--
	lbs/day ¹	--	167	--	--

Parameter	Units	Effluent Limitations			
		Average Monthly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
Oil and Grease	mg/L	--	15	--	--
	lbs/day ¹	--	83	--	--
pH	s.u.	--	--	6.5	8.5
Total Suspended Solids (TSS)	mg/L	--	75	--	--
	lbs/day ¹	--	417	--	--
Non-Conventional Pollutants					
Chronic Toxicity ²	Pass or Fail, % Effect	--	Pass or % Effect < 50	--	--
Settleable Solids	ml/L	--	0.3	--	--
Temperature	deg. F	--	--	--	86
Turbidity	NTU	--	75	--	--
Total Petroleum Hydrocarbons (TPH) ^{3, 5}	µg/L	--	100	--	--
	lbs/day ¹	--	0.56	--	--
Priority Pollutants					
Copper, Total Recoverable (All-weather) ⁴	µg/L	--	23	--	--
	lbs/day ¹	--	0.13	--	--
Lead, Total Recoverable (All-weather) ⁴	µg/L	--	10.8	--	--
	lbs/day ¹	--	0.060	--	--
Zinc, Total Recoverable (All-weather)	µg/L	--	185	--	--
	lbs/day ¹	--	1.03	--	--
Cyanide	µg/L	--	8.5	--	--
	lbs/day ¹	--	0.047	--	--
Bis (2-Ethylhexyl) Phthalate	µg/L	--	12	--	--
	lbs/day ¹	--	0.067	--	--

- The mass emission rates are based on the maximum permitted flow rate of 0.666 MGD at Discharge Point 001, and are calculated as follows:

$$\text{Flow (MGD)} \times \text{Concentration (mg/L)} \times 8.34 \text{ (conversion factor)} = \text{lbs/day.}$$
- The maximum daily effluent limitation (MDEL) for chronic toxicity shall be reported as "Pass" or "Fail" and "% Effect". The MDEL is exceeded when a toxicity test results in a "Fail," and the percent effect is greater than or equal to 0.50. Report "Pass" or "Fail" and "% Effect" for Maximum Daily Effluent Limitation (MDEL).
- TPH equals the sum of TPH gasoline (C₄-C₁₂), TPH diesel (C₁₃-C₂₂), and TPH waste oil (C₂₃₊).
- Effluent limitations for these metals will be effective after August 7, 2019.
- Effluent limitations for TPH will be effective after August 7, 2019, as per the accompanying Time Schedule Order No. R4-2018-0021.

2. Final Effluent Limitations – Discharge Point 002 (Dabney-Lloyd Basin)

- The Discharger shall maintain compliance with the following effluent limitations individually at Discharge Point 002, with compliance measured at Monitoring Location EFF-002 as described in the Monitoring and Reporting Program (Attachment E):

Table 4b. Effluent Limitations at Discharge Point 002 (Dabney-Lloyd Basin)

Parameter	Units	Effluent Limitations			
		Average Monthly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
Conventional Pollutants					
Biochemical Oxygen Demand (BOD) (5-day @ 20 deg. C)	mg/L	--	30	--	--
	lbs/day ¹	--	766	--	--
Oil and Grease	mg/L	--	15	--	--
	lbs/day ¹	--	383	--	--
pH	s.u.	--	--	6.5	8.5
Settleable Solids	ml/L	--	0.3	--	--
Total Suspended Solids (TSS)	mg/L	--	75	--	--
	lbs/day ¹	--	1910	--	--
Non-Conventional Pollutants					
Chronic Toxicity ²	Pass or Fail, % Effect	--	Pass or % Effect < 50	--	--
Temperature	deg. F	--	--	--	86
Turbidity	NTU	--	75	--	--
Total Petroleum Hydrocarbons (TPH) ^{3, 6}	µg/L	--	100	--	--
	lbs/day ¹	--	2.55	--	--
Priority Pollutants					
Copper , Total Recoverable (Dry-weather) ⁵	µg/L	--	58	--	--
	lbs/day ¹	--	1.48	--	--
Copper , Total Recoverable (Wet-weather) ^{4, 5}	µg/L	--	14	--	--
	lbs/day ¹	--	0.36	--	--
Lead, Total Recoverable (Dry-weather) ⁵	µg/L	--	32	--	--
	lbs/day ¹	--	0.82	--	--
Lead, Total Recoverable (Wet-weather) ⁵	µg/L	--	77	--	--
	lbs/day ¹	--	1.97	--	--
Selenium , Total Recoverable (All-weather)	µg/L	--	8.7	--	--
	lbs/day ¹	--	0.22	--	--
Zinc, Total Recoverable (Dry-weather) ⁵	µg/L	--	733	--	--
	lbs/day ¹	--	18.7	--	--
Zinc, Total Recoverable (Wet-weather) ^{4, 5}	µg/L	--	105	--	--
	lbs/day ¹	--	2.68	--	--

- The mass emission rates are based on the maximum permitted flow rate of 3.06 MGD at Discharge Point 002, and are calculated as follows:

$$\text{Flow (MGD)} \times \text{Concentration (mg/L)} \times 8.34 \text{ (conversion factor)} = \text{lbs/day.}$$
- The maximum daily effluent limitation (MDEL) for chronic toxicity shall be reported as "Pass" or "Fail" and "% Effect". The MDEL is exceeded when a toxicity test results in a "Fail," and the percent effect is greater than or equal to 0.50. Report "Pass" or "Fail" and "% Effect" for Maximum Daily Effluent Limitation (MDEL).
- TPH equals the sum of TPH gasoline (C₄-C₁₂), TPH diesel (C₁₃-C₂₂), and TPH waste oil (C₂₃₊).
- Effluent limitations for these metals will be effective after August 7, 2019.
- Dry-weather effluent limitations are applicable when the maximum daily flow in Ballona Creek is less than 64 cubic feet per second (cfs). Wet-weather effluent limitations are applicable when the maximum daily flow in Ballona

Creek is equal to or greater than 64 cfs. Flow data can be obtained by contacting Mr. Arthur Gotingco (Tel: 626-458-6379; Email: agoting@dpw.lacounty.gov) at LACDPW.

6. Effluent limitations for TPH will be effective after August 7, 2019, as per the accompanying Time Schedule Order No. R4-2018-0021.

3. Final Effluent Limitations – Discharge Point 003 (Stocker Basin)

- a. The Discharger shall maintain compliance with the following effluent limitations individually at Discharge Point 003, with compliance measured at Monitoring Location EFF-003 as described in the Monitoring and Reporting Program (Attachment E):

Table 4c. Effluent Limitations at Discharge Point 003 (Stocker Basin)

Parameter	Units	Effluent Limitations			
		Average Monthly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
Conventional Pollutants					
Biochemical Oxygen Demand (BOD) (5-day @ 20 deg. C)	mg/L	--	30	--	--
	lbs/day ¹	--	159	--	--
Oil and Grease	mg/L	--	15	--	--
	lbs/day ¹	--	79	--	--

Zinc, Total Recoverable (All-weather)	µg/L	--	185	--	--
	lbs/day ¹	--	0.98	--	--

1. The mass emission rates are based on the maximum permitted flow rate of 0.634 MGD at Discharge Point 003, and are calculated as follows:

$$\text{Flow (MGD)} \times \text{Concentration (mg/L)} \times 8.34 \text{ (conversion factor)} = \text{lbs/day.}$$
2. The maximum daily effluent limitation (MDEL) for chronic toxicity shall be reported as "Pass" or "Fail" and "% Effect". The MDEL is exceeded when a toxicity test results in a "Fail," and the percent effect is greater than or equal to 0.50. Report "Pass" or "Fail" and "% Effect" for Maximum Daily Effluent Limitation (MDEL).
3. TPH equals the sum of TPH gasoline (C₄-C₁₂), TPH diesel (C₁₃-C₂₂), and TPH waste oil (C₂₃₊).
4. Effluent limitations for these metals will be effective after August 7, 2019.

5. Effluent limitations for TPH will be effective after August 7, 2019, as per the accompanying Time Schedule Order No. R4-2018-0021.

4. Final Effluent Limitations – Discharge Point 004 (Vickers - I Basin)

- a. The Discharger shall maintain compliance with the following effluent limitations individually at Discharge Point 004, with compliance measured at Monitoring Location EFF-004 as described in the Monitoring and Reporting Program (Attachment E):

Table 4d. Effluent Limitations at Discharge Point 004 (Vickers - I Basin)

Parameter	Units	Effluent Limitations			
		Average Monthly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
Conventional Pollutants

Zinc, Total Recoverable (Dry-weather) ⁴	µg/L	--	733	--	--
	lbs/day ¹	--	6.17	--	--
Zinc, Total Recoverable (Wet-weather) ⁴	µg/L	--	105	--	--
	lbs/day ¹	--	0.88	--	--

- The mass emission rates are based on the maximum permitted flow rate of 1.01 MGD at Discharge Point 005, and are calculated as follows:

$$\text{Flow (MGD)} \times \text{Concentration (mg/L)} \times 8.34 \text{ (conversion factor)} = \text{lbs/day.}$$
- The maximum daily effluent limitation (MDEL) for chronic toxicity shall be reported as "Pass" or "Fail" and "% Effect". The MDEL is exceeded when a toxicity test results in a "Fail," and the percent effect is greater than or equal to 0.50. Report "Pass" or "Fail" and "% Effect" for Maximum Daily Effluent Limitation (MDEL).
- TPH equals the sum of TPH gasoline (C₄-C₁₂), TPH diesel (C₁₃-C₂₂), and TPH waste oil (C₂₃₊).
- Dry-weather effluent limitations are applicable when the maximum daily flow in Ballona Creek is less than 64 cubic feet per second (cfs). Wet-weather effluent limitations are applicable when the maximum daily flow in Ballona Creek is equal to or greater than 64 cfs. Flow data can be obtained by contacting Mr. Arthur Gotingco (Tel: 626-458-6379; Email: agotingco@dpw.lacounty.gov) at LACDPW.
- Effluent limitations for TPH will be effective after August 7, 2019, as per the accompanying Time Schedule Order No. R4-2018-0021

6. Final Effluent Limitations – Discharge Point 006 (Upper Vickers - II Basin)

- The Discharger shall maintain compliance with the following effluent limitations individually at Discharge Point 006, with compliance measured at Monitoring Location EFF-006 as described in the Monitoring and Reporting Program (Attachment E):

Table 4f. Effluent Limitations at Discharge Point 006 (Upper Vickers - II Basin)

Parameter	Units	Effluent Limitations			
		Average Monthly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
Conventional Pollutants					
Biochemical Oxygen Demand (BOD) (5-day @ 20 deg. C)	mg/L	--	30	--	--
	lbs/day ¹	--	150	--	--

Zinc, Total Recoverable (Wet-weather) ^{4, 5}	µg/L	--	105	--	--
	lbs/day ¹	--	0.53	--	--

- The mass emission rates are based on the maximum permitted flow rate of 0.6 MGD at Discharge Point 006, and are calculated as follows:

$$\text{Flow (MGD)} \times \text{Concentration (mg/L)} \times 8.34 \text{ (conversion factor)} = \text{lbs/day.}$$
- The maximum daily effluent limitation (MDEL) for chronic toxicity shall be reported as "Pass" or "Fail" and "% Effect". The MDEL is exceeded when a toxicity test results in a "Fail," and the percent effect is greater than or equal to 0.50. Report "Pass" or "Fail" and "% Effect" for Maximum Daily Effluent Limitation (MDEL).
- TPH equals the sum of TPH gasoline (C₄-C₁₂), TPH diesel (C₁₃-C₂₂), and TPH waste oil (C₂₃₊).
- Effluent limitations for these metals will be effective after August 7, 2019.
- Dry-weather effluent limitations are applicable when the maximum daily flow in Ballona Creek is less than 64 cubic feet per second (cfs). Wet-weather effluent limitations are applicable when the maximum daily flow in Ballona Creek is equal to or greater than 64 cfs. Flow data can be obtained by contacting Mr. Arthur Gotingco (Tel: 626-458-6379; Email: agoting@dpw.lacounty.gov) at LACDPW.
- Effluent limitations for TPH will be effective after August 7, 2019, as per the accompanying Time Schedule Order No. R4-2018-0021.

B. Effluent Sediment Limitations

1. Final Effluent Sediment Limitations – Discharge Points 001 through 006

- The Ballona Creek Estuary Toxic Pollutants TMDL requires the Discharger maintain compliance with the following sediment limitations in the effluents from Discharge Points 001 through 006, with compliance measured at Monitoring Locations EFF-001 through 006, respectively, as described in the attached Monitoring and Reporting Program (MRP) (Attachment E). The Discharger shall collect sufficient effluent sample to provide an adequate amount of effluent sediments for sediment analyses or other such analytical method approved in advance by the Regional Board that would allow direct comparison of effluent sediment levels with sediment limitations.

Table 5. Effluent Sediment Limitations—Discharge Points 001 through 006

Parameter	Units	Effluent Sediment Limitations
		Maximum Daily
Cadmium, Total Recoverable	mg/kg	1.2
Copper, Total Recoverable	mg/kg	34
Lead, Total Recoverable	mg/kg	46.7
Silver, Total Recoverable	mg/kg	1.0
Zinc, Total Recoverable	mg/kg	150
Chlordane	µg/kg	1.3
DDTs ¹	µg/kg	1.9
Total PCBs ²	µg/kg	3.2

1. The State Water Board Water Quality Control Plan for Enclosed Bays and Estuaries – Part 1 Sediment Quality, August 25, 2009, (known as Sediment Quality Plan, Attachment A) listed chemical analytes needed to characterize sediment contamination exposure and effect. According to Sediment Quality Plan, DDTs shall mean the sum of 4,4'DDT, 2,4'DDT, 4,4'DDE, 2,4'DDE, 4,4'DDD and 2,4'DDD.
2. According to Sediment Quality Plan, total PCBs (polychlorinated biphenyls) shall mean the sum of the following PCB congeners: 2,4'-dichlorobiphenyl, 2,2',5-trichlorobiphenyl, 2,4,4'-trichlorobiphenyl, 2,2',3,5'-tetrachlorobiphenyl, 2,2',5,5'-tetrachlorobiphenyl, 2,3',4,4'-tetrachlorobiphenyl, 2,2',4,5,5'-pentachlorobiphenyl, 2,3,3',4,4'-pentachlorobiphenyl, 2,3',4,4',5-pentachlorobiphenyl, 2,2',3,3',4,4'-hexachlorobiphenyl, 2,2',3,4,4',5'-hexachlorobiphenyl, 2,2',4,4',5,5'-hexachlorobiphenyl, 2,2',3,3',4,4',5-heptachlorobiphenyl, 2,2',3,4,4',5,5'-heptachlorobiphenyl, 2,2',3,4,4',5,5',6-heptachlorobiphenyl, 2,2',3,3',4,4',5,6-octachlorobiphenyl, 2,2',3,3',4,4',5,5',6-nonachlorobiphenyl, and decachlorobiphenyl.

C. Land Discharge Specifications – Not Applicable

D. Recycling Specifications – Not Applicable

V. RECEIVING WATER LIMITATIONS

A. Surface Water Limitations

The discharge shall not cause the following in Ballona Creek or its tributary, Centinela Creek.:

1. The pH of the receiving water shall not be depressed below 6.5 or raised above 8.5 as a result of the waste discharge. Ambient pH levels shall not be changed more than 0.5 units from natural conditions as a result of the waste discharge. Natural conditions shall be determined on a case-by-case basis.
2. Surface water temperature to rise greater than 5° F above the natural temperature of the receiving waters at any time or place. At no time shall the temperature be raised above 80° F as a result of waste discharged.
3. The mean annual concentration of dissolved oxygen shall be greater than 7 mg/L, and no single determination shall be less than 5.0 mg/L except when natural conditions cause lesser concentrations. Natural conditions shall be determined on a case-by-case basis.

4. Water Contact Standards

In fresh water designated for water contact recreation (REC-1), the waste discharged shall not cause the following bacterial standards to be exceeded in the receiving water.

- a. Geometric Mean Limit
 - i. *E. coli* density shall not exceed 126/100 mL.
- b. Single Sample Limit
 - i. *E. coli* density shall not exceed 235/100 mL.

5. Exceedance of the total ammonia (as N) concentrations specified in the Resolution No. 2002-011, Amendment to the Water Quality Control Plan for the Los Angeles Region to Update the Ammonia Objectives for Inland Surface Waters (including enclosed bays, estuaries and wetlands) with Beneficial Use Designations for Protection of Aquatic Life; and the Regional Water Board Resolution No. 2005-014, An Amendment to the Water Quality Control Plan for the Los Angeles Region to Revise Early Life Stage Implementation Provision of the Freshwater Ammonia Objectives for Inland Surface Waters (including enclosed bays, estuaries and wetlands) for Protection of Aquatic Life.
6. The presence of visible, floating, suspended or deposited macroscopic particulate matter or foam.
7. Where natural turbidity is between 0 to 50 NTU, increases in turbidity shall not exceed 20%. Where natural turbidity is greater than 50 NTU, increases in turbidity shall not exceed 10%.
8. Oils, greases, waxes, or other materials in concentrations that result in a visible film or coating on the surface of the receiving water or on objects in the water.
9. Suspended or settleable materials, chemical substances or pesticides in amounts that cause nuisance or adversely affect any designated beneficial use.
10. Toxic or other deleterious substances in concentrations or quantities which cause deleterious effects on aquatic biota, wildlife, or waterfowl or render any of these unfit for human consumption either at levels created in the receiving waters or as a result of biological concentration.
11. Accumulation of bottom deposits or aquatic growths.
12. The presence of substances that result in increases of BOD that adversely affect beneficial uses.
13. Taste or odor-producing substances in concentrations that alter the natural taste, odor, and/or color of fish, shellfish, or other edible aquatic resources; cause nuisance; or adversely affect beneficial uses.
14. Alteration of apparent color beyond present natural background levels.
15. Damage, discolor, or formation of sludge deposits on flood control structures or facilities, or overloading of the design capacity.
16. Degradation of surface water communities and populations including vertebrate, invertebrate, and plant species.
17. Problems associated with breeding of mosquitoes, gnats, black flies, midges, or other pests.

18. Nuisance or adversely affect beneficial uses of the receiving water, including but not limited to biostimulatory substances at concentrations that promote aquatic growth to the extent that such growth causes nuisance or adversely affects beneficial uses.
19. Violation of any applicable water quality standards for receiving waters adopted by the Regional Water Board or State Water Board. If more stringent applicable water quality standards are promulgated or approved pursuant to section 303 of the CWA, or amendments thereto, the Regional Water Board will revise or modify this Order in accordance with such standards.

B. Groundwater Limitations – Not Applicable

VI. PROVISIONS

A. Standard Provisions

1. The Discharger shall comply with all Standard Provisions included in Attachment D.
2. The Discharger shall comply with the following provisions. In the event that there is any conflict, duplication, or overlap between provisions specified by this Order, the more stringent provision shall apply:
 - a. This Order may be modified, revoked, reissued, or terminated in accordance with the provisions of 40 C.F.R. sections 122.44, 122.62, 122.63, 122.64, 125.62 and 125.64. Causes for taking such actions include, but are not limited to: failure to comply with any condition of this Order; endangerment to human health or the environment resulting from the permitted activity; or acquisition of newly-obtained information which would have justified the application of different conditions if known at the time of Order adoption. The filing of a request by the Discharger for an Order modification, revocation, and issuance or termination, or a notification of planned changes or anticipated noncompliance does not stay any condition of this Order.
 - b. The Discharger must comply with the lawful requirements of municipalities, counties, drainage districts, and other local agencies regarding discharges of storm water to storm drain systems or other water courses under their jurisdiction; including applicable requirements in municipal storm water management programs developed to comply with NPDES permits issued by the Regional Water Board to local agencies.
 - c. The Discharger shall comply with all applicable effluent limitations, national standards of performance, toxic effluent standards, and all federal regulations established pursuant to sections 301, 302, 303(d), 304, 306, 307, 316, 318, 405, and 423 of the federal CWA and amendments thereto.
 - d. These requirements do not exempt the operator of the waste disposal facility from compliance with any other laws, regulations, or ordinances which may be applicable; they do not legalize this waste disposal facility, and they leave unaffected any further restraints on the disposal of wastes at this site which may be contained in other statutes or required by other agencies.
 - e. Oil or oily material, chemicals, refuse, or other wastes that constitute a condition of pollution or nuisance shall not be stored or deposited in areas where they may be picked up by rainfall and carried off of the property and/or discharged to surface waters. Any such spill of such materials shall be contained and removed immediately.
 - f. A copy of these waste discharge specifications shall be maintained at the discharge facility so as to be available at all times to operating personnel.

- g. After notice and opportunity for a hearing, this Order may be terminated or modified for cause, including, but not limited to:
 - i. Violation of any term or condition contained in this Order;
 - ii. Obtaining this Order by misrepresentation, or failure to disclose all relevant facts;
 - iii. A change in any condition that requires either a temporary or permanent reduction or elimination of the authorized discharge.
- h. If there is any storage of hazardous or toxic materials or hydrocarbons at this facility and if the facility is not manned at all times, a 24-hour emergency response telephone number shall be prominently posted where it can easily be read from the outside.
- i. The Discharger shall file with the Regional Water Board a report of waste discharge at least 180 days before making any material change or proposed changes in the character, location, or volume of the discharge.
- j. All existing manufacturing, commercial, mining, and silvicultural dischargers must notify the Regional Water Board as soon as they know or have reason to believe that they have begun or expect to begin to use or manufacture an intermediate or final product or byproduct of any toxic pollutant that was not reported on their application.
- k. In the event of any change in name, ownership, or control of these waste disposal facilities, the discharger shall notify this Regional Water Board of such change and shall notify the succeeding owner or operator of the existence of this Order by letter, a copy of which shall be forwarded to the Regional Water Board.
- l. The Water Code provides that any person who violates a waste discharge requirement or a provision of the Water Code is subject to civil liability of up to \$5,000 per day, \$10,000 per day, or \$25,000 per day of violation, or when the violation involves the discharge of pollutants, is subject to civil liability of up to \$10 per gallon per day or \$25 per gallon per day of violation; or some combination thereof, depending on the violation, or upon the combination of violations.
- m. Violation of any of the provisions of this Order may subject the violator to any of the penalties described herein, or any combination thereof, at the discretion of the prosecuting authority; except that only one kind of penalty may be applied for each kind of violation.
- n. The Discharger shall notify the Executive Officer in writing no later than 6 months prior to the planned discharge of any chemical, other than the products previously reported to the Executive Officer, which may be toxic to aquatic life. Such notification shall include:
 - i. Name and general composition of the chemical,
 - ii. Frequency of use,
 - iii. Quantities to be used,
 - iv. Proposed discharge concentrations, and
 - v. U.S. EPA registration number, if applicable.
- o. Failure to comply with provisions or requirements of this Order, or violation of other applicable laws or regulations governing discharges from this facility, may subject the Discharger to administrative or civil liabilities, criminal penalties, and/or other enforcement remedies to ensure compliance. Additionally, certain violations may

subject the Discharger to civil or criminal enforcement from appropriate local, state, or federal law enforcement entities.

- p. In the event the Discharger does not comply or will be unable to comply for any reason, with any prohibition, effluent limitation, or receiving water limitation of this Order, the Discharger shall notify the Regional Water Board by telephone (213) 576-6600 within 24 hours of having knowledge of such noncompliance, and shall confirm this notification in writing within five days, unless the Regional Water Board waives confirmation. The written notification shall state the nature, time, duration, and cause of noncompliance, and shall describe the measures being taken to remedy the current noncompliance and, prevent recurrence including, where applicable, a schedule of implementation. Other noncompliance requires written notification as above at the time of the normal monitoring report.
- q. Prior to making any change in the point of discharge, place of use, or purpose of use of treated wastewater that results in a decrease of flow in any portion of a watercourse, the Discharger must file a petition with the State Water Board, Division of Water Rights, and receive approval for such a change. (Wat. Code § 1211.)
- r. The provisions of this order are severable. If any provision of this Order is found invalid, the remainder of this Order shall not be affected.

B. Monitoring and Reporting Program (MRP) Requirements

The Discharger shall comply with the MRP, and future revisions thereto, in Attachment E.

C. Special Provisions

1. Reopener Provisions

- a. If more stringent applicable water quality standards are promulgated or approved pursuant to section 303 of the federal CWA, and amendments thereto, the Regional Water Board may revise and modify this Order in accordance with such more stringent standards.
- b. This Order may be reopened to include effluent limitations for toxic constituents determined to be present in significant amounts in the discharge through a more comprehensive monitoring program included as part of this Order and based on the results of the RPA.
- c. This Order may be reopened and modified, in accordance with the provisions set forth in 40 C.F.R., parts 122 and 124, to include requirements for the implementation of the watershed management approach or to include new minimum levels (MLs).
- d. This Order may be reopened and modified to revise effluent limitations as a result of future Basin Plan Amendments, such as an update of an objective or the adoption of a TMDL for the Ballona Creek Watershed.
- e. This Order may be reopened for modification, or revocation and reissuance, as a result of the detection of a reportable priority pollutant generated by special conditions included in this Order. These special conditions may be, but are not limited to: fish tissue sampling, whole effluent toxicity, monitoring requirements on internal waste stream(s), and monitoring for surrogate parameters. Additional requirements may be included in this Order as a result of the special condition monitoring data.
- f. This Order may be reopened upon submission by the Discharger of adequate information, as determined by the Regional Water Board, to provide for dilution credits or a mixing zone, as may be appropriate.

2. Special Studies, Technical Reports and Additional Monitoring Requirements

- a. **Initial Investigation Toxicity Reduction Evaluation (TRE) Workplan.** The Discharger shall submit to the Regional Water Board an Initial Investigation TRE workplan (1-2 pages) **within 90 days** of the effective date of this permit. This plan shall describe the steps the Discharger intends to follow in the event that toxicity is detected. See section V of the Monitoring and Reporting Program (Attachment E) for an overview of TRE requirements.
- b. **Effluent Sediment Monitoring.** The Ballona Creek Estuary Toxic Pollutants TMDL requires the Discharger maintain compliance with the sediment limitations in Table 5. The Discharger is required to collect a sufficient amount of effluent sediment from each discharge point for the sediment analyses. Since the TSS concentration in the final discharge may be less than the TSS effluent limitation of 75 mg/L, a very large volume of effluent sample may be required in order to gather enough sediment for the required analyses (metals and organics). Therefore, high resolution analytical methods (EPA approved) may be used to analyze specific constituents in the sediments. Because of the much lower method detection limits provided by the high resolution analytical methods, less amount of sediments will be required for the demonstration of compliance with the sediment limitations. **Within 90 days** of the effective date of this Order, the Discharger may submit a work plan to the Regional Water Board for approval by the Executive Officer to analyze discharge sediments using high resolution analytical methods. The work plan shall include the proposed high resolution analytical methods for sediment analyses, the sampling protocols and the estimated volume of effluent required for each analysis when using the proposed high resolution analytical method at a prespecified TSS level (less than 75 mg/L) in the effluent.

3. Best Management Practices and Storm Water Pollution Prevention

- a. Storm Water Pollution Prevention, Best Management Practices, and Spill Contingency Plans.
The Discharger shall submit, within **90 days** of the effective date of this Order (unless otherwise stated):
 - i. An updated **Storm Water Pollution Prevention Plan (SWPPP)** that describes site-specific management practices for minimizing contamination of storm water runoff and for preventing contaminated storm water runoff and trash from being discharged directly to waters of the State. The SWPPP shall cover all areas of the Facility and shall include an updated drainage map for the Facility. The Discharger shall identify on a map of appropriate scale the areas that contribute runoff to the permitted discharge point; describe the activities in each area and the potential for contamination of storm water runoff and the discharge of trash or hazardous waste/material; and address the feasibility of containment and/or treatment of storm water. In addition, the SWPPP shall address and include best management practices procedures that the Discharger will implement to prohibit the discharge of trash from the Facility. The SWPPP shall be developed in accordance with the requirements in Attachment G.
 - ii. An updated **Best Management Practices Plan (BMPP)** that will be implemented to reduce the discharge of pollutants to the receiving water. The BMPP shall include site-specific plans and procedures implemented and/or to be implemented to prevent hazardous waste/material and trash

from being discharged to waters of the State. Further, the Discharger shall ensure that the storm water discharges from the Facility would neither cause nor contribute to a nuisance in the receiving water, and that unauthorized discharges (i.e. spills or non-storm water discharges) to the receiving water have been effectively prohibited. In particular, a risk assessment of each area identified by the Discharger shall be performed to determine the potential for hazardous or toxic waste/material and trash discharge to surface waters. The BMPs shall be consistent with the general guidance contained in the U.S. EPA Guidance Manual for Developing Best Management Practices (BMPs) (EPA 833-B-93-004). The BMPP can be included and submitted as part of the SWPPP.

- iii. An updated **Spill Control Plan (SCP)**, that describes the preventive (failsafe) and contingency (cleanup) plans for controlling accidental discharges, and for minimizing the effect of such events. The SCP may be substituted with an updated version of the Discharger's existing Spill Prevention Control and Countermeasure (SPCC) Plan.
- iv. Submit a report to the Regional Board within **12 months** of the effective date of this Order that analyzes the feasibility of implementing additional stormwater storage capacity to handle high-intensity storm events.

Each plan shall cover all areas of the Facility and shall include an updated drainage map for the Facility. The plans shall be reviewed annually and at the same time and updated as required. Updated information shall be submitted to the Regional Water Board within 30 days of revision.

The Discharger shall implement the SWPPP, BMPP, and SCP (or SPCC) within 10 days of approval by the Executive Officer or no later than 90 days after submission to the Regional Water Board, whichever comes first. The Discharger shall continue to implement any existing and previously approved SWPPP, BMPP, and SCP (or SPCC) until the updated version is approved by the Executive Officer or until the stipulated 90-day period after the updated SWPPP, BMPP, and SCP (or SPCC) submittal has occurred.

4. Construction, Operation and Maintenance Specifications

The Discharger shall at all times properly operate and maintain all facilities and systems installed or used to achieve compliance with this Order.

5. Other Special Provisions – Not Applicable

6. Compliance Schedules – Not Applicable

VII. COMPLIANCE DETERMINATION

Compliance with the effluent limitations contained in section IV of this Order will be determined as specified below:

A. Single Constituent Effluent Limitation.

If the concentration of the pollutant in the monitoring sample is greater than the effluent limitation and greater than or equal to the reported Minimum Level (see Reporting Requirement I.H. of the MRP), then the Discharger is out of compliance.

B. Effluent Limitations Expressed as a Sum of Several Constituents.

If the sum of the individual pollutant concentrations is greater than the effluent limitation, then the Discharger is out of compliance. In calculating the sum of the concentrations of a

group of pollutants, consider constituents reported as ND or DNQ to have concentrations equal to zero, provided that the applicable ML is used.

C. Effluent Limitations Expressed as a Median.

In determining compliance with a median limitation, the analytical results in a set of data will be arranged in order of magnitude (either increasing or decreasing order); and

1. If the number of measurements (n) is odd, then the median will be calculated as $X_{(n+1)/2}$, or
2. If the number of measurements (n) is even, then the median will be calculated as $[X_{n/2} + X_{(n/2)+1}]/2$, i.e. the midpoint between the n/2 and n/2+1 data points.

D. Multiple Sample Data.

When determining compliance with an AMEL or MDEL for priority pollutants and more than one sample result is available, the Discharger shall compute the arithmetic mean unless the data set contains one or more reported determinations of "Detected, but Not Quantified" (DNQ) or "Not Detected" (ND). In those cases, the Discharger shall compute the median in place of the arithmetic mean in accordance with the following procedure:

1. The data set shall be ranked from low to high, ranking the reported ND determinations lowest, DNQ determinations next, followed by quantified values (if any). The order of the individual ND or DNQ determinations is unimportant.
2. The median value of the data set shall be determined. If the data set has an odd number of data points, then the median is the middle value. If the data set has an even number of data points, then the median is the average of the two values around the middle unless one or both of the points are ND or DNQ, in which case the median value shall be the lower of the two data points where DNQ is lower than a value and ND is lower than DNQ.

E. Average Monthly Effluent Limitation (AMEL).

If the average (or when applicable, the median determined by subsection 2 above for multiple sample data) of daily discharges over a calendar month exceeds the AMEL for a given parameter, this will represent a single violation; though the Discharger will be considered out of compliance for each day of that month for that parameter (e.g., resulting in 31 days of non-compliance in a 31-day month). If only a single sample is taken during the calendar month and the analytical result for that sample exceeds the AMEL, the Discharger will be considered out of compliance for that calendar month. For any one calendar month during which no sample (daily discharge) is taken, no compliance determination can be made for that calendar month.

In determining compliance with the AMEL, the following provisions shall also apply to all constituents:

1. If the analytical result of a single sample, monitored monthly, quarterly, semiannually, or annually, does not exceed the AMEL for that constituent, the Discharger has demonstrated compliance with the AMEL for that month;
2. If the analytical result of a single sample monitored monthly, quarterly, semiannually, or annually, exceeds the AMEL for any constituent, the Discharger shall collect four additional samples at approximately equal intervals during the month. All five analytical results shall be reported in the monitoring report for that month, or 45 days after results for the additional samples were received, whichever is later. The concentration of a pollutant (an arithmetic mean or a median) in these samples estimated from the

“Multiple Sample Data Reduction” section above, will be used for compliance determination.

3. In the event of noncompliance with an AMEL, the sampling frequency for that constituent may be increased to weekly and may continue at this level until compliance with the AMEL has been demonstrated.

F. Maximum Daily Effluent Limitation (MDEL).

If a daily discharge exceeds the MDEL for a given parameter, an alleged violation will be flagged and the discharger will be considered out of compliance for that parameter for that 1 day only within the reporting period. For any 1 day during which no sample is taken, no compliance determination can be made for that day.

G. Instantaneous Minimum Effluent Limitation.

If the analytical result of a single grab sample is lower than the instantaneous minimum effluent limitation for a parameter, a violation will be flagged and the discharger will be considered out of compliance for that parameter for that single sample. Non-compliance for each sample will be considered separately (e.g., the results of two grab samples taken within a calendar day that both are lower than the instantaneous minimum effluent limitation would result in two instances of non-compliance with the instantaneous minimum effluent limitation).

H. Instantaneous Maximum Effluent Limitation.

If the analytical result of a single grab sample is higher than the instantaneous maximum effluent limitation for a parameter, a violation will be flagged and the discharger will be considered out of compliance for that parameter for that single sample. Non-compliance for each sample will be considered separately (e.g., the results of two grab samples taken within a calendar day that both exceed the instantaneous maximum effluent limitation would result in two instances of non-compliance with the instantaneous maximum effluent limitation.)

I. Chronic Toxicity.

The discharge is subject to determination of “Pass” or “Fail” and “Percent Effect” from a single-effluent concentration chronic toxicity test at the discharge IWC using the Test of Significant Toxicity (TST) statistical approach described in National Pollutant Discharge Elimination System Test of Significant Toxicity Implementation Document (EPA 833-R-10-003, 2010), Appendix A, Figure A-1, and Table A-1. The null hypothesis (H_0) for the TST statistical approach is: Mean discharge IWC response $\leq 0.75 \times$ Mean control response. A test result that rejects this null hypothesis is reported as “Pass”. A test result that does not reject this null hypothesis is reported as “Fail”. The relative “Percent Effect” at the discharge IWC is defined and reported as: $((\text{Mean control response} - \text{Mean discharge IWC response}) \div \text{Mean control response}) \times 100\%$.

The Median Monthly Effluent Limitation (MMEL) for chronic toxicity is exceeded and a violation will be flagged when the median of no more than three independent chronic toxicity tests, conducted within the same calendar month and analyzed using the TST statistical approach, results in “Fail”. The MMEL for chronic toxicity shall only apply when there is a discharge more than one day in a calendar month period. During such calendar months, up to three independent toxicity tests are required when one toxicity test results in “Fail.”

The Maximum Daily Effluent Limitation (MDEL) for chronic toxicity is exceeded and a violation will be flagged when a chronic toxicity test, analyzed using the TST statistical approach, results in “Fail” and the “Percent Effect” is $\geq 50\%$.

J. Mass and Concentration Limitations.

Compliance with mass effluent limitations and concentration effluent limitations for the same parameter shall be determined separately. When the concentration for a parameter in a sample is reported as ND or DNQ, the corresponding mass emission rate determined using that sample concentration shall also be reported as ND or DNQ.

K. Median Monthly Effluent Limitation (MMEL).

If the median of daily discharges over a calendar month exceeds the MMEL for a given parameter, an alleged violation will be flagged and the Discharger will be considered out of compliance for each day of that month for that parameter (e.g., resulting in 31 days of noncompliance in a 31-day month). However, an alleged violation of the MMEL will be considered one violation for the purpose of assessing State mandatory minimum penalties. If no sample (daily discharge) is taken over a calendar month, no compliance determination can be made for that month with respect to effluent violation determination, but compliance determination can be made for that month with respect to reporting violation determination.

L. Bacterial Standards and Analyses.

The geometric mean used for determining compliance with bacterial standards is calculated using the following equation:

$$\text{Geometric Mean} = (C_1 \times C_2 \times \dots \times C_n)^{1/n}$$

where n is the number of days samples were collected during the period and C is the concentration of bacteria (MPN/100 mL or CFU/100 mL) found on each day of sampling. For bacterial analyses, sample dilutions should be performed so the expected range of values is bracketed (for example, with multiple tube fermentation method or membrane filtration method, 2 to 16,000 per 100 ml for total and fecal coliform, at a minimum, and 1 to 1000 per 100 ml for *Enterococcus*). The detection method used for each analysis shall be reported with the results of the analysis.

Detection methods used for coliforms (total, fecal, and *E. coli*) and *Enterococcus* shall be those presented in Table 1A of 40 C.F.R. part 136 (revised May 18, 2012), unless alternate methods have been approved by U.S. EPA pursuant to 40 C.F.R. part 136 or improved methods have been determined by the Executive Officer and/or U.S. EPA.

ATTACHMENT A – DEFINITIONS

Arithmetic Mean (μ)

Also called the average, is the sum of measured values divided by the number of samples. For ambient water concentrations, the arithmetic mean is calculated as follows:

Arithmetic mean = $\mu = \Sigma x / n$ where: Σx is the sum of the measured ambient water concentrations, and n is the number of samples.

Average Monthly Effluent Limitation (AMEL)

The highest allowable average of daily discharges over a calendar month, calculated as the sum of all daily discharges measured during a calendar month divided by the number of daily discharges measured during that month.

Average Weekly Effluent Limitation (AWEL)

The highest allowable average of daily discharges over a calendar week (Sunday through Saturday), calculated as the sum of all daily discharges measured during a calendar week divided by the number of daily discharges measured during that week.

Best Management Practices

BMPs are methods, measures, or practices designed and selected to reduce or eliminate the discharge of pollutants to surface waters from point and nonpoint source discharges including storm water. BMPs include structural and non-structural controls and operation maintenance procedures, which can be applied before, during, and/or after pollution-producing activities.

Bioaccumulative

Those substances taken up by an organism from its surrounding medium through gill membranes, epithelial tissue, or from food and subsequently concentrated and retained in the body of the organism.

Carcinogenic

Pollutants are substances that are known to cause cancer in living organisms.

Coefficient of Variation (CV)

CV is a measure of the data variability and is calculated as the estimated standard deviation divided by the arithmetic mean of the observed values.

Daily Discharge

Daily Discharge is defined as either: (1) the total mass of the constituent discharged over the calendar day (12:00 am through 11:59 pm) or any 24-hour period that reasonably represents a calendar day for purposes of sampling (as specified in the permit), for a constituent with limitations expressed in units of mass or; (2) the unweighted arithmetic mean measurement of the constituent over the day for a constituent with limitations expressed in other units of measurement (e.g., concentration).

The daily discharge may be determined by the analytical results of a composite sample taken over the course of one day (a calendar day or other 24-hour period defined as a day) or by the arithmetic mean of analytical results from one or more grab samples taken over the course of the day.

For composite sampling, if 1 day is defined as a 24-hour period other than a calendar day, the analytical result for the 24-hour period will be considered as the result for the calendar day in which the 24-hour period ends.

Detected, but Not Quantified (DNQ)

DNQ are those sample results less than the RL, but greater than or equal to the laboratory’s MDL. Sample results reported as DNQ are estimated concentrations.

Dilution Credit

Dilution Credit is the amount of dilution granted to a discharge in the calculation of a water quality-based effluent limitation, based on the allowance of a specified mixing zone. It is calculated from the dilution ratio or determined through conducting a mixing zone study or modeling of the discharge and receiving water.

Dry Weather

Any day when the maximum daily flow in the Ballona Creek is less than 64 cubic feet per second (cfs). Flow data for Ballona Creek is currently monitored between Sawtelle Boulevard and Sepulveda Boulevard by Los Angeles County Department of Public Works (LACDPW) at Stream Gage No. F38C-R.

Effluent Concentration Allowance (ECA)

ECA is a value derived from the water quality criterion/objective, dilution credit, and ambient background concentration that is used, in conjunction with the coefficient of variation for the effluent monitoring data, to calculate a long-term average (LTA) discharge concentration. The ECA has the same meaning as wasteload allocation (WLA) as used in U.S. EPA guidance (Technical Support Document For Water Quality-based Toxics Control, March 1991, second printing, EPA/505/2-90-001).

Enclosed Bays

Enclosed Bays means indentations along the coast that enclose an area of oceanic water within distinct headlands or harbor works. Enclosed bays include all bays where the narrowest distance between the headlands or outermost harbor works is less than 75 percent of the greatest dimension of the enclosed portion of the bay. Enclosed bays include, but are not limited to, Humboldt Bay, Bodega Harbor, Tomales Bay, Drake’s Estero, San Francisco Bay, Morro Bay, Los Angeles-Long Beach Harbor, Upper and Lower Newport Bay, Mission Bay, and San Diego Bay. Enclosed bays do not include inland surface waters or ocean waters.

Estimated Chemical Concentration

The estimated chemical concentration that results from the confirmed detection of the substance by the analytical method below the ML value.

Estuaries

Estuaries means waters, including coastal lagoons, located at the mouths of streams that serve as areas of mixing for fresh and ocean waters. Coastal lagoons and mouths of streams that are temporarily separated from the ocean by sandbars shall be considered estuaries. Estuarine waters shall be considered to extend from a bay or the open ocean to a point upstream where there is no significant mixing of fresh water and seawater. Estuarine waters included, but are not limited to, the Sacramento-San Joaquin Delta, as defined in Water Code section 12220, Suisun Bay, Carquinez Strait downstream to the Carquinez Bridge, and appropriate areas of the Smith, Mad, Eel, Noyo, Russian, Klamath, San Diego, and Otay rivers. Estuaries do not include inland surface waters or ocean waters.

Existing Discharger

Any Discharger that is not a new discharger. An existing discharger includes an “increasing discharger” (i.e., any existing facility with treatment systems in places for its current discharge that is or will be expanding, upgrading, or modifying its permitted discharge after the effective date of this Order.)

Four-Day Average of Daily Maximum Flows

The average of daily maxima taken from the data set in four-day intervals.

Inland Surface Waters

All surface waters of the state that do not include the ocean, enclosed bays, or estuaries.

Instantaneous Maximum Effluent Limitation

The highest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous maximum limitation).

Instantaneous Minimum Effluent Limitation

The lowest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous minimum limitation).

Maximum Daily Effluent Limitation (MDEL)

The highest allowable daily discharge of a pollutant, over a calendar day (or 24-hour period). For pollutants with limitations expressed in units of mass, the daily discharge is calculated as the total mass of the pollutant discharged over the day. For pollutants with limitations expressed in other units of measurement, the daily discharge is calculated as the arithmetic mean measurement of the pollutant over the day.

Median

The middle measurement in a set of data. The median of a set of data is found by first arranging the measurements in order of magnitude (either increasing or decreasing order). If the number of measurements (n) is odd, then the median = $X_{(n+1)/2}$. If n is even, then the median = $(X_{n/2} + X_{(n/2)+1})/2$ (i.e., the midpoint between the $n/2$ and $n/2+1$).

Median Monthly Effluent Limitation (MMEL)

The MMEL is, for the purposes of this Policy, an effluent limit based on the median results of three independent toxicity tests, conducted within the same calendar month, and analyzed using the TST statistical approach. The MMEL is exceeded when the median results (i.e. two out of three) is a "fail".

Method Detection Limit (MDL)

MDL is the minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero, as defined in 40 C.F.R. part 136, Attachment B, revised as of July 3, 1999.

Minimum Level (ML)

ML is the concentration at which the entire analytical system must give a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

Mixing Zone

Mixing Zone is a limited volume of receiving water that is allocated for mixing with a wastewater discharge where water quality criteria can be exceeded without causing adverse effects to the overall water body.

Not Detected (ND)

Sample results which are less than the laboratory's MDL.

Persistent Pollutants

Persistent pollutants are substances for which degradation or decomposition in the environment is nonexistent or very slow.

Pollutant Minimization Program (PMP)

PMP means waste minimization and pollution prevention actions that include, but are not limited to, product substitution, waste stream recycling, alternative waste management methods, and education of the public and businesses. The goal of the PMP shall be to reduce all potential sources of a priority pollutant(s) through pollutant minimization (control) strategies, including pollution prevention measures as appropriate, to maintain the effluent concentration at or below the water quality-based effluent limitation. Pollution prevention measures may be particularly appropriate for persistent bioaccumulative priority pollutants where there is evidence that beneficial uses are being impacted. The Regional Water Board may consider cost effectiveness when establishing the requirements of a PMP. The completion and implementation of a Pollution Prevention Plan, if required pursuant to Water Code section 13263.3(d), shall be considered to fulfill the PMP requirements.

Pollution Prevention

Pollution Prevention means any action that causes a net reduction in the use or generation of a hazardous substance or other pollutant that is discharged into water and includes, but is not limited to, input change, operational improvement, production process change, and product reformulation (as defined in Water Code section 13263.3). Pollution prevention does not include actions that merely shift a pollutant in wastewater from one environmental medium to another environmental medium, unless clear environmental benefits of such an approach are identified to the satisfaction of the State Water Resources Control Board (State Water Board) or Regional Water Board.

Reporting Level (RL)

The RL is the ML (and its associated analytical method) chosen by the Discharger for reporting and compliance determination from the MLs included in this Order, including an additional factor if applicable as discussed herein. The MLs included in this Order correspond to approved analytical methods for reporting a sample result that are selected by the Regional Water Board either from Appendix 4 of the SIP in accordance with section 2.4.2 of the SIP or established in accordance with section 2.4.3 of the SIP. The ML is based on the proper application of method-based analytical procedures for sample preparation and the absence of any matrix interferences. Other factors may be applied to the ML depending on the specific sample preparation steps employed. For example, the treatment typically applied in cases where there are matrix-effects is to dilute the sample or sample aliquot by a factor of ten. In such cases, this additional factor must be applied to the ML in the computation of the RL.

Significant Storm Event

A continuous discharge of storm water for a minimum of one hour, or the intermittent discharge of storm water for a minimum of 3 hours in a 12-hour period.

Source of Drinking Water

Any water designated as municipal or domestic supply (MUN) in a Regional Water Board Basin Plan.

Standard Deviation (σ)

Standard Deviation is a measure of variability that is calculated as follows:

$$\sigma = (\sum[(x - \mu)^2]/(n - 1))^{0.5}$$

where:

x is the observed value;

μ is the arithmetic mean of the observed values; and

n is the number of samples.

Toxicity Reduction Evaluation (TRE)

TRE is a study conducted in a step-wise process designed to identify the causative agents of effluent or ambient toxicity, isolate the sources of toxicity, evaluate the effectiveness of toxicity control options, and then confirm the reduction in toxicity. The first steps of the TRE consist of the collection of data relevant to the toxicity, including additional toxicity testing, and an evaluation of facility operations and maintenance practices, and best management practices. A Toxicity Identification Evaluation (TIE) may be required as part of the TRE, if appropriate. (A TIE is a set of procedures to identify the specific chemical(s) responsible for toxicity. These procedures are performed in three phases (characterization, identification, and confirmation) using aquatic organism toxicity tests.)

Trash

All improperly discarded solid material from any production, manufacturing, or processing operation including, but not limited to, products, product packaging, or containers constructed of plastic, steel, aluminum, glass, paper, or other synthetic or natural material.

Wet Weather

Any day when the maximum daily flow in the Ballona Creek is equal to or greater than 64 cubic feet per second (cfs). Flow data for Ballona Creek is currently monitored between Sawtelle Boulevard and Sepulveda Boulevard by Los Angeles County Department of Public Works (LACDPW) at Stream Gage No. F38C-R.

ATTACHMENT C – FACILITY FLOW SCHEMATIC

ATTACHMENT D – STANDARD PROVISIONS

I. STANDARD PROVISIONS – PERMIT COMPLIANCE

A. Duty to Comply

1. The Discharger must comply with all of the terms, requirements, and conditions of this Order. Any noncompliance constitutes a violation of the Clean Water Act (CWA) and the California Water Code and is grounds for enforcement action; permit termination, revocation and reissuance, or modification; denial of a permit renewal application; or a combination thereof. (40 C.F.R. § 122.41(a); Wat. Code, §§ 13261, 13263, 13265, 13268, 13000, 13001, 13304, 13350, 13385.)
2. The Discharger shall comply with effluent standards or prohibitions established under section 307(a) of the CWA for toxic pollutants within the time provided in the regulations that establish these standards or prohibitions, even if this Order has not yet been modified to incorporate the requirement. (40 C.F.R. § 122.41(a)(1).)

B. Need to Halt or Reduce Activity Not a Defense

It shall not be a defense for a Discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Order. (40 C.F.R. § 122.41(c).)

C. Duty to Mitigate

The Discharger shall take all reasonable steps to minimize or prevent any discharge in violation of this Order that has a reasonable likelihood of adversely affecting human health or the environment. (40 C.F.R. § 122.41(d).)

D. Proper Operation and Maintenance

The Discharger shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Discharger to achieve compliance with the conditions of this Order. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar systems that are installed by a Discharger only when necessary to achieve compliance with the conditions of this Order. (40 C.F.R. § 122.41(e).)

E. Property Rights

1. This Order does not convey any property rights of any sort or any exclusive privileges. (40 C.F.R. § 122.41(g).)
2. The issuance of this Order does not authorize any injury to persons or property or invasion of other private rights, or any infringement of state or local law or regulations. (40 C.F.R. § 122.5(c).)

F. Inspection and Entry

The Discharger shall allow the Regional Water Board, State Water Board, U.S. EPA, and/or their authorized representatives (including an authorized contractor acting as their representative), upon the presentation of credentials and other documents, as may be required by law, to (33 U.S.C. § 1318(a)(4)(B); 40 C.F.R. § 122.41(i); Wat. Code, §§ 13267, 13383):

1. Enter upon the Discharger's premises where a regulated facility or activity is located or conducted, or where records are kept under the conditions of this Order (33 U.S.C. § 1318(a)(4)(B)(i); 40 C.F.R. § 122.41(i)(1); Wat. Code, §§ 13267, 13383);
2. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this Order (33 U.S.C. § 1318(a)(4)(B)(ii); 40 C.F.R. § 122.41(i)(2); Wat. Code, §§ 13267, 13383);
3. Inspect and photograph, at reasonable times, any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order (33 U.S.C. § 1318(a)(4)(B)(ii); 40 C.F.R. § 122.41(i)(3); Wat. Code, §§ 13267, 13383); and
4. Sample or monitor, at reasonable times, for the purposes of assuring Order compliance or as otherwise authorized by the CWA or the Water Code, any substances or parameters at any location. (33 U.S.C. § 1318(a)(4)(B); 40 C.F.R. § 122.41(i)(4); Wat. Code, §§ 13267, 13383.)

G. Bypass

1. Definitions
 - a. "Bypass" means the intentional diversion of waste streams from any portion of a treatment facility. (40 C.F.R. § 122.41(m)(1)(i).)
 - b. "Severe property damage" means substantial physical damage to property, damage to the treatment facilities, which causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production. (40 C.F.R. § 122.41(m)(1)(ii).)
2. Bypass not exceeding limitations. The Discharger may allow any bypass to occur which does not cause exceedances of effluent limitations, but only if it is for essential maintenance to assure efficient operation. These bypasses are not subject to the provisions listed in Standard Provisions – Permit Compliance I.G.3, I.G.4, and I.G.5 below. (40 C.F.R. § 122.41(m)(2).)
3. Prohibition of bypass. Bypass is prohibited, and the Regional Water Board may take enforcement action against a Discharger for bypass, unless (40 C.F.R. § 122.41(m)(4)(i)):
 - a. Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage (40 C.F.R. § 122.41(m)(4)(i)(A));
 - b. There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass that occurred during normal periods of equipment downtime or preventive maintenance (40 C.F.R. § 122.41(m)(4)(i)(B)); and
 - c. The Discharger submitted notice to the Regional Water Board as required under Standard Provisions – Permit Compliance I.G.5 below. (40 C.F.R. § 122.41(m)(4)(i)(C).)
4. The Regional Water Board may approve an anticipated bypass, after considering its adverse effects, if the Regional Water Board determines that it will meet the three conditions listed in Standard Provisions – Permit Compliance I.G.3 above. (40 C.F.R. § 122.41(m)(4)(ii).)
5. Notice

- a. Anticipated bypass. If the Discharger knows in advance of the need for a bypass, it shall submit prior notice, if possible at least 10 days before the date of the bypass. The notice shall be sent to the Regional Water Board. As of December 21, 2020, notices shall also be submitted electronically to the initial recipient defined in Standard Provisions – Reporting V.J below. Notices shall comply with 40 C.F.R. part 3, 40 C.F.R. section 122.22, and 40 C.F.R. part 127. (40 C.F.R. § 122.41(m)(3)(i).)
- b. Unanticipated bypass. The Discharger shall submit a notice of an unanticipated bypass as required in Standard Provisions - Reporting V.E below (24-hour notice). The notice shall be sent to the Regional Water Board. As of December 21, 2020, notice shall also be submitted electronically to the initial recipient defined in Standard Provisions – Reporting V.J below. Notices shall comply with 40 C.F.R. part 3, 40 C.F.R. section 122.22, and 40 C.F.R. part 127. (40 C.F.R. § 122.41(m)(3)(ii).)

H. Upset

Upset means an exceptional incident in which there is unintentional and temporary noncompliance with technology based permit effluent limitations because of factors beyond the reasonable control of the Discharger. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation. (40 C.F.R. § 122.41(n)(1).)

1. Effect of an upset. An upset constitutes an affirmative defense to an action brought for noncompliance with such technology based permit effluent limitations if the requirements of Standard Provisions – Permit Compliance I.H.2 below are met. No determination made during administrative review of claims that noncompliance was caused by upset, and before an action for noncompliance, is final administrative action subject to judicial review. (40 C.F.R. § 122.41(n)(2))
2. Conditions necessary for a demonstration of upset. A Discharger who wishes to establish the affirmative defense of upset shall demonstrate, through properly signed, contemporaneous operating logs or other relevant evidence that (40 C.F.R. § 122.41(n)(3)):
 - a. An upset occurred and that the Discharger can identify the cause(s) of the upset (40 C.F.R. § 122.41(n)(3)(i));
 - b. The permitted facility was, at the time, being properly operated (40 C.F.R. § 122.41(n)(3)(ii));
 - c. The Discharger submitted notice of the upset as required in Standard Provisions – Reporting V.E.2.b below (24-hour notice) (40 C.F.R. § 122.41(n)(3)(iii)); and
 - d. The Discharger complied with any remedial measures required under Standard Provisions – Permit Compliance I.C above. (40 C.F.R. § 122.41(n)(3)(iv).)
3. Burden of proof. In any enforcement proceeding, the Discharger seeking to establish the occurrence of an upset has the burden of proof. (40 C.F.R. § 122.41(n)(4).)

II. STANDARD PROVISIONS – PERMIT ACTION

A. General

This Order may be modified, revoked and reissued, or terminated for cause. The filing of a request by the Discharger for modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any Order condition. (40 C.F.R. § 122.41(f).)

B. Duty to Reapply

If the Discharger wishes to continue an activity regulated by this Order after the expiration date of this Order, the Discharger must apply for and obtain a new permit. (40 C.F.R. § 122.41(b).)

C. Transfers

This Order is not transferable to any person except after notice to the Regional Water Board. The Regional Water Board may require modification or revocation and reissuance of the Order to change the name of the Discharger and incorporate such other requirements as may be necessary under the CWA and the Water Code. (40 C.F.R. §§ 122.41(l)(3), 122.61.)

III. STANDARD PROVISIONS – MONITORING

A. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity. (40 C.F.R. § 122.41(j)(1).)

B. Monitoring must be conducted according to test procedures approved under 40 C.F.R. part 136 for the analyses of pollutants unless another method is required under 40 C.F.R. chapter 1, subchapter N. Monitoring must be conducted according to sufficiently sensitive test methods approved under 40 C.F.R. part 136 for the analysis of pollutants or pollutant parameters or as required under 40 C.F.R. chapter 1, subchapter N. For the purposes of this paragraph, a method is sufficiently sensitive when:

1. The method minimum level (ML) is at or below the level of the most stringent effluent limitation established in the permit for the measured pollutant or pollutant parameter, and either the method ML is at or below the level of the most stringent applicable water quality criterion for the measured pollutant or pollutant parameter or the method ML is above the applicable water quality criterion but the amount of the pollutant or pollutant parameter in the facility's discharge is high enough that the method detects and quantifies the level of the pollutant or pollutant parameter in the discharge; or
2. The method has the lowest ML of the analytical methods approved under 40 C.F.R. part 136 or required under 40 C.F.R. chapter 1, subchapter N for the measured pollutant or pollutant parameter.

In the case of pollutants or pollutant parameters for which there are no approved methods under 40 C.F.R. part 136 or otherwise required under 40 C.F.R. chapter 1, subchapter N, monitoring must be conducted according to a test procedure specified in this Order for such pollutants or pollutant parameters. (40 C.F.R. §§ 122.21(e)(3), 122.41(j)(4), 122.44(i)(1)(iv).)

IV. STANDARD PROVISIONS – RECORDS

A. The Discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the application for this Order, for a period of at least three (3) years from the date of the sample, measurement, report or application. This period may be extended by request of the Regional Water Board Executive Officer at any time. (40 C.F.R. § 122.41(j)(2).)

B. Records of monitoring information shall include:

1. The date, exact place, and time of sampling or measurements (40 C.F.R. § 122.41(j)(3)(i));
2. The individual(s) who performed the sampling or measurements (40 C.F.R. § 122.41(j)(3)(ii));
3. The date(s) analyses were performed (40 C.F.R. § 122.41(j)(3)(iii));
4. The individual(s) who performed the analyses (40 C.F.R. § 122.41(j)(3)(iv));

5. The analytical techniques or methods used (40 C.F.R. § 122.41(j)(3)(v)); and
 6. The results of such analyses. (40 C.F.R. § 122.41(j)(3)(vi).)
- C. Claims of confidentiality for the following information will be denied (40 C.F.R. § 122.7(b)):
1. The name and address of any permit applicant or Discharger (40 C.F.R. § 122.7(b)(1)); and
 2. Permit applications and attachments, permits and effluent data. (40 C.F.R. § 122.7(b)(2).)

V. STANDARD PROVISIONS – REPORTING

A. Duty to Provide Information

The Discharger shall furnish to the Regional Water Board, State Water Board, or U.S. EPA within a reasonable time, any information which the Regional Water Board, State Water Board, or U.S. EPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Order or to determine compliance with this Order. Upon request, the Discharger shall also furnish to the Regional Water Board, State Water Board, or U.S. EPA copies of records required to be kept by this Order. (40 C.F.R. § 122.41(h); Wat. Code, §§ 13267, 13383.)

B. Signatory and Certification Requirements

1. All applications, reports, or information submitted to the Regional Water Board, State Water Board, and/or U.S. EPA shall be signed and certified in accordance with Standard Provisions – Reporting V.B.2, V.B.3, V.B.4, V.B.5, and V.B.6 below. (40 C.F.R. § 122.41(k).)
2. All permit applications shall be signed by a responsible corporate officer. For the purpose of this section, a responsible corporate officer means: (i) A president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy- or decision-making functions for the corporation, or (ii) the manager of one or more manufacturing, production, or operating facilities, provided, the manager is authorized to make management decisions which govern the operation of the regulated facility including having the explicit or implicit duty of making major capital investment recommendations, and initiating and directing other comprehensive measures to assure long term environmental compliance with environmental laws and regulations; the manager can ensure that the necessary systems are established or actions taken to gather complete and accurate information for permit application requirements; and where authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures. (40 C.F.R. § 122.22(a)(1).)
3. All reports required by this Order and other information requested by the Regional Water Board, State Water Board, or U.S. EPA shall be signed by a person described in Standard Provisions – Reporting V.B.2 above, or by a duly authorized representative of that person. A person is a duly authorized representative only if:
 - a. The authorization is made in writing by a person described in Standard Provisions – Reporting V.B.2 above (40 C.F.R. § 122.22(b)(1));
 - b. The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position.) (40 C.F.R. § 122.22(b)(2)); and

- c. The written authorization is submitted to the Regional Water Board and State Water Board. (40 C.F.R. § 122.22(b)(3).)
4. If an authorization under Standard Provisions – Reporting V.B.3 above is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of Standard Provisions – Reporting V.B.3 above must be submitted to the Regional Water Board and State Water Board prior to or together with any reports, information, or applications, to be signed by an authorized representative. (40 C.F.R. § 122.22(c).)
5. Any person signing a document under Standard Provisions – Reporting V.B.2 or V.B.3 above shall make the following certification:

“I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.” (40 C.F.R. § 122.22(d).)
6. Any person providing the electronic signature for documents described in Standard Provisions – V.B.1, V.B.2, or V.B.3 that are submitted electronically shall meet all relevant requirements of Standard Provisions – Reporting V.B, and shall ensure that all relevant requirements of 40 C.F.R. part 3 (Cross-Media Electronic Reporting) and 40 C.F.R. part 127 (NPDES Electronic Reporting Requirements) are met for that submission. (40 C.F.R. § 122.22(e).)

C. Monitoring Reports

1. Monitoring results shall be reported at the intervals specified in the Monitoring and Reporting Program (Attachment E) in this Order. (40 C.F.R. § 122.41(l)(4).)
2. Monitoring results must be reported on a Discharge Monitoring Report (DMR) form or forms provided or specified by the Regional Water Board or State Water. As of December 21, 2016, all reports and forms must be submitted electronically to the initial recipient defined in Standard Provisions – Reporting V.J and comply with 40 C.F.R. part 3, 40 C.F.R. section 122.22, and 40 C.F.R. part 127. (40 C.F.R. § 122.41(l)(4)(i).)
3. If the Discharger monitors any pollutant more frequently than required by this Order using test procedures approved under 40 C.F.R. part 136, or another method required for an industry-specific waste stream under 40 C.F.R. chapter 1, subchapter N, the results of such monitoring shall be included in the calculation and reporting of the data submitted in the DMR or reporting form specified by the Regional Water Board or State Water Board. (40 C.F.R. § 122.41(l)(4)(ii).)
4. Calculations for all limitations, which require averaging of measurements, shall utilize an arithmetic mean unless otherwise specified in this Order. (40 C.F.R. § 122.41(l)(4)(iii).)

D. Compliance Schedules

Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this Order, shall be submitted no later than 14 days following each schedule date. (40 C.F.R. § 122.41(l)(5).)

E. Twenty-Four Hour Reporting

1. The Discharger shall report any noncompliance which may endanger health or the environment. Any information shall be provided orally within 24 hours from the time the Discharger becomes aware of the circumstances. A report shall also be provided within five (5) days of the time the Discharger becomes aware of the circumstances. The report shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance.

For noncompliance events related to combined sewer overflows, sanitary sewer overflows, or bypass events, these reports must include the data described above (with the exception of time of discovery) as well as the type of event (i.e., combined sewer overflow, sanitary sewer overflow, or bypass event), type of overflow structure (e.g., manhole, combined sewer overflow outfall), discharge volume untreated by the treatment works treating domestic sewage, types of human health and environmental impacts of the event, and whether the noncompliance was related to wet weather.

As of December 21, 2020, all reports related to combined sewer overflows, sanitary sewer overflows, or bypass events must be submitted to the Regional Water Board and must be submitted electronically to the initial recipient defined in Standard Provisions – Reporting V.J. The reports shall comply with 40 C.F.R. part 3, 40 C.F.R. section 122.22, and 40 C.F.R. part 127. The Regional Water Board may also require the Discharger to electronically submit reports not related to combined sewer overflows, sanitary sewer overflows, or bypass events under this section. (40 C.F.R. § 122.41(l)(6)(i).)

2. The following shall be included as information that must be reported within 24 hours:
 - c. Any unanticipated bypass that exceeds any effluent limitation in this Order. (40 C.F.R. § 122.41(l)(6)(ii)(A).)
 - d. Any upset that exceeds any effluent limitation in this Order. (40 C.F.R. § 122.41(l)(6)(ii)(B).)
3. The Regional Water Board may waive the above required written report on a case-by-case basis if an oral report has been received within 24 hours. (40 C.F.R. § 122.41(l)(6)(ii)(B).)

F. Planned Changes

The Discharger shall give notice to the Regional Water Board as soon as possible of any planned physical alterations or additions to the permitted facility. Notice is required under this provision only when (40 C.F.R. § 122.41(l)(1)):

1. The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in section 122.29(b) (40 C.F.R. § 122.41(l)(1)(i)); or
2. The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants that are subject neither to effluent limitations in this Order nor to notification requirements under section 122.42(a)(1) (see Additional Provisions—Notification Levels VII.A.1). (40 C.F.R. § 122.41(l)(1)(ii).)

G. Anticipated Noncompliance

The Discharger shall give advance notice to the Regional Water Board of any planned changes in the permitted facility or activity that may result in noncompliance with this Order's requirements. (40 C.F.R. § 122.41(l)(2).)

H. Other Noncompliance

The Discharger shall report all instances of noncompliance not reported under Standard Provisions – Reporting V.C, V.D, and V.E above at the time monitoring reports are submitted. The reports shall contain the information listed in Standard Provision – Reporting V.E above. For noncompliance events related to combined sewer overflows, sanitary sewer overflows, or bypass events, these reports shall contain the information described in Standard Provision – Reporting V.E and the applicable required data in appendix A to 40 C.F.R. part 127. The Regional Water Board may also require the Discharger to electronically submit reports not related to combined sewer overflows, sanitary sewer overflows, or bypass events under this section. (40 C.F.R. § 122.41(l)(7).)

I. Other Information

When the Discharger becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the Regional Water Board, State Water Board, or U.S. EPA, the Discharger shall promptly submit such facts or information. (40 C.F.R. § 122.41(l)(8).)

J. Initial Recipient for Electronic Reporting Data

The owner, operator, or the duly authorized representative is required to electronically submit NPDES information specified in appendix A to 40 C.F.R. part 127 to the initial recipient defined in 40 C.F.R. section 127.2(b). U.S. EPA will identify and publish the list of initial recipients on its website and in the Federal Register, by state and by NPDES data group [see 40 C.F.R. section 127.2(c)]. U.S. EPA will update and maintain this listing. (40 C.F.R. § 122.41(l)(9).)

VI. STANDARD PROVISIONS – ENFORCEMENT

- A.** The Regional Water Board is authorized to enforce the terms of this permit under several provisions of the Water Code, including, but not limited to, sections 13268, 13385, 13386, and 13387.
- B.** The CWA provides that any person who violates section 301, 302, 306, 307, 308, 318 or 405 of the Act, or any permit condition or limitation implementing any such sections in a permit issued under section 402, or any requirement imposed in a pretreatment program approved under sections 402(a)(3) or 402(b)(8) of the Act, is subject to a civil penalty not to exceed \$25,000 per day for each violation. The CWA provides that any person who negligently violates sections 301, 302, 306, 307, 308, 318, or 405 of the Act, or any condition or limitation implementing any of such sections in a permit issued under section 402 of the Act, or any requirement imposed in a pretreatment program approved under section 402(a)(3) or 402(b)(8) of the Act, is subject to criminal penalties of \$2,500 to \$25,000 per day of violation, or imprisonment of not more than one (1) year, or both. In the case of a second or subsequent conviction for a negligent violation, a person shall be subject to criminal penalties of not more than \$50,000 per day of violation, or by imprisonment of not more than two (2) years, or both. Any person who knowingly violates such sections, or such conditions or limitations is subject to criminal penalties of \$5,000 to \$50,000 per day of violation, or imprisonment for not more than three (3) years, or both. In the case of a second or subsequent conviction for a knowing violation, a person shall be subject to criminal penalties of not more than \$100,000 per day of violation, or imprisonment of not more than six (6) years, or both. Any person who knowingly violates section 301, 302, 303, 306, 307, 308, 318 or 405 of the Act, or any permit condition or limitation implementing any of such sections in a permit issued under section 402 of the Act, and who knows at that time that he thereby places another person in imminent danger of death or serious bodily injury, shall, upon conviction, be subject to a fine of not more than \$250,000 or imprisonment of not more than 15 years, or both. In the case of a second or subsequent

conviction for a knowing endangerment violation, a person shall be subject to a fine of not more than \$500,000 or by imprisonment of not more than 30 years, or both. An organization, as defined in section 309(c)(3)(B)(iii) of the CWA, shall, upon conviction of violating the imminent danger provision, be subject to a fine of not more than \$1,000,000 and can be fined up to \$2,000,000 for second or subsequent convictions [section 122.41(a)(2)] [Water Code sections 13385 and 13387].

- C. Any person may be assessed an administrative penalty by the Regional Water Board for violating section 301, 302, 306, 307, 308, 318 or 405 of this Act, or any permit condition or limitation implementing any of such sections in a permit issued under section 402 of this Act. Administrative penalties for Class I violations are not to exceed \$10,000 per violation, with the maximum amount of any Class I penalty assessed not to exceed \$25,000. Penalties for Class II violations are not to exceed \$10,000 per day for each day during which the violation continues, with the maximum amount of any Class II penalty not to exceed \$125,000 [40 C.F.R. section 122.41(a)(3)].
- D. The CWA provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this Order shall, upon conviction, be punished by a fine of not more than \$10,000, or by imprisonment for not more than 2 years, or both. If a conviction of a person is for a violation committed after a first conviction of such person under this paragraph, punishment is a fine of not more than \$20,000 per day of violation, or by imprisonment of not more than 4 years, or both [40 C.F.R. section 122.41(j)(5)].
- E. The CWA provides that any person who knowingly makes any false statement, representation, or certification in any record or other document submitted or required to be maintained under this Order, including monitoring reports or reports of compliance or noncompliance shall, upon conviction, be punished by a fine of not more than \$10,000 per violation, or by imprisonment for not more than six months per violation, or by both [40 C.F.R. section 122.41(k)(2)].

VII. ADDITIONAL PROVISIONS – NOTIFICATION LEVELS

A. Non-Municipal Facilities

Existing manufacturing, commercial, mining, and silvicultural Dischargers shall notify the Regional Water Board as soon as they know or have reason to believe (40 C.F.R. § 122.42(a)):

- 1. That any activity has occurred or will occur that would result in the discharge, on a routine or frequent basis, of any toxic pollutant that is not limited in this Order, if that discharge will exceed the highest of the following "notification levels" (40 C.F.R. § 122.42(a)(1)):
 - a. 100 micrograms per liter ($\mu\text{g/L}$) (40 C.F.R. § 122.42(a)(1)(i));
 - b. 200 $\mu\text{g/L}$ for acrolein and acrylonitrile; 500 $\mu\text{g/L}$ for 2,4-dinitrophenol and 2-methyl-4,6-dinitrophenol; and 1 milligram per liter (mg/L) for antimony (40 C.F.R. § 122.42(a)(1)(ii));
 - c. Five (5) times the maximum concentration value reported for that pollutant in the Report of Waste Discharge (40 C.F.R. § 122.42(a)(1)(iii)); or
 - d. The level established by the Regional Water Board in accordance with section 122.44(f). (40 C.F.R. § 122.42(a)(1)(iv).)
- 2. That any activity has occurred or will occur that would result in the discharge, on a non-routine or infrequent basis, of any toxic pollutant that is not limited in this Order, if that discharge will exceed the highest of the following "notification levels" (40 C.F.R. § 122.42(a)(2)):
 - a. 500 micrograms per liter ($\mu\text{g/L}$) (40 C.F.R. § 122.42(a)(2)(i));

- b. 1 milligram per liter (mg/L) for antimony (40 C.F.R. § 122.42(a)(2)(ii));
- c. Ten (10) times the maximum concentration value reported for that pollutant in the Report of Waste Discharge (40 C.F.R. § 122.42(a)(2)(iii)); or
- d. The level established by the Regional Water Board in accordance with section 122.44(f). (40 C.F.R. § 122.42(a)(2)(iv).)

ATTACHMENT E – MONITORING AND REPORTING PROGRAM (MRP NO. 6240)

Section 308 of the federal Clean Water Act (CWA) and sections 122.41(h), (j)-(l), 122.44(i), and 122.48 of title 40 of the Code of Federal Regulations (40 C.F.R.) require that all NPDES permits specify monitoring and reporting requirements. Water Code sections 13267 and 13383 also authorize the Regional Water Board to establish monitoring, inspection, entry, reporting, and recordkeeping requirements. This MRP establishes monitoring, reporting, and recordkeeping requirements that implement the federal and California laws and/or regulations.

I. GENERAL MONITORING PROVISIONS

- A.** Effluent sampling stations shall be established for Discharge Points 001 through 006, respectively, and shall be located where representative samples of that effluent can be obtained.
- B.** The Regional Water Board shall be notified in writing of any changes in the sampling stations once established or in the methods for determining the quantities of pollutants in the individual waste streams.
- C.** Effluent samples shall be taken downstream of any addition to treatment works and prior to mixing with the receiving waters.
- D.** Pollutants shall be analyzed using the analytical methods described in 40 C.F.R. sections 136.3, 136.4, and 136.5 (revised August 28, 2017); or, where no methods are specified for a given pollutant, by methods approved by this Regional Water Board or the State Water Board.
- E.** Laboratory Certification. Laboratories analyzing monitoring samples shall be certified by the State Water Board, Drinking Water Division, Environmental Laboratory Accreditation Program (ELAP) in accordance with the provision of Water Code section 13176, and must include quality assurance/quality control data with their reports. A copy of the laboratory certification shall be provided each time a new certification and/or renewal of the certification is obtained from ELAP.
- F.** For any analyses performed for which no procedure is specified in the U.S. EPA guidelines or in the MRP, the constituent or parameter analyzed and the method or procedure used must be specified in the monitoring report.
- G.** Each monitoring report must affirm in writing that “all analyses were conducted at a laboratory certified for such analyses by the State Water Board or approved by the Executive Officer and in accordance with current U.S. EPA guideline procedures or as specified in this MRP”.
- H.** The monitoring reports shall specify the analytical method used, the Method Detection Limit (MDL), and the Minimum Level (ML) for each pollutant. For the purpose of reporting compliance with numerical limitations, performance goals, and receiving water limitations, analytical data shall be reported by one of the following methods, as appropriate:
 - 1.** An actual numerical value for sample results greater than or equal to the ML; or
 - 2.** “Detected, but Not Quantified (DNQ)” if results are greater than or equal to the laboratory’s MDL but less than the ML. The estimated chemical concentration of the sample shall also be reported; or,
 - 3.** “Not-Detected (ND)” for sample results less than the laboratory’s MDL with the MDL indicated for the analytical method used.

Analytical data reported as “less than” for the purpose of reporting compliance with permit limitations shall be the same or lower than the permit limit(s) established for the given parameter.

Current MLs (Attachment H) are those published by the State Water Board in the *Policy for the Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California*, February 24, 2005.

- I. The MLs employed for effluent analyses to determine compliance with effluent limitations shall be lower than the effluent limitations established in this Order for a given parameter as per the sufficiently sensitive regulations at 40 C.F.R. section 122.44(i)(1)(iv). If the ML value is not below the effluent limitations, then the lowest ML value and its associated analytical method shall be selected for compliance purposes. At least once a year, the Discharger shall submit a list of the analytical methods employed for each test and associated laboratory QA/QC procedures.
- J. The MLs employed for effluent analyses not associated with determining compliance with effluent limitations in this Order shall be lower than the lowest applicable water quality objective, for a given parameter as per the sufficiently sensitive regulations at 40 C.F.R. section 122.44(i)(1)(iv). Water quality objectives for parameters may be found in Chapter 3 of the Basin Plan and the CTR (40 C.F.R. section 131.38). If the ML value is not below the water quality objective, then the lowest ML value and its associated analytical method shall be selected for compliance purposes. At least once a year, the Discharger shall submit a list of the analytical methods employed for each test, the associated laboratory QA/QC procedures, reporting levels (RLs), and method detection limits (MDLs).

Where no U.S. EPA-approved method exists, the Regional Water Board, in consultation with the State Water Board Quality Assurance Program, shall establish a ML that is not contained in Attachment H to be included in the Discharger's permit in any of the following situations:

- 1. When the pollutant under consideration is not included in Attachment H;
 - 2. When the Discharger and Regional Water Board agree to include in the permit a test method that is more sensitive than that specified in 40 C.F.R. part 136 (revised August 28, 2017);
 - 3. When the Discharger agrees to use an ML that is lower than that listed in Attachment H;
 - 4. When the Discharger demonstrates that the calibration standard matrix is sufficiently different from that used to establish the ML in Attachment H, and proposes an appropriate ML for their matrix; or,
 - 5. When the Discharger uses a method whose quantification practices are not consistent with the definition of an ML. Examples of such methods are the U.S. EPA-approved method 1613 for dioxins and furans, method 1624 for volatile organic substances, and method 1625 for semi-volatile organic substances. In such cases, the Discharger, the Regional Water Board, and the State Water Board shall agree on a lowest quantifiable limit and that limit will substitute for the ML for reporting and compliance determination purposes.
- K. Water/wastewater samples must be analyzed within allowable holding time limits as specified in 40 C.F.R. section 136.3. All QA/QC items must be run on the same dates the samples were actually analyzed, and the results shall be reported in the Regional Water Board format, when it becomes available, and submitted with the laboratory reports. Proper chain of custody procedures must be followed, and a copy of the chain of custody shall be submitted with the report.
 - L. Field analyses with short sample holding times such as pH, total residual chlorine, dissolved oxygen and temperature, may be performed using properly calibrated and maintained portable instruments by trained personnel acting on the Discharger's behalf, using methods in accordance with 40 C.F.R. part 136. All field instruments must be calibrated per manufacturer's instructions. A manual containing the standard operating procedures for all field analyses,

including records of personnel proficiency training, instruments calibration and maintenance, and quality control procedures shall be maintained onsite, and shall be available for inspection by Regional Water Board staff. Information including instrument calibration, time of sample collection, time of analysis, name of analyst, quality assurance/quality control data, and measurement values shall be clearly documented during each field analysis and submitted to the Regional Water Board as part of the corresponding regular monitoring report.

- M.** All analyses shall be accompanied by the chain of custody, including but not limited to date and time of sampling, sample identification, and name of person who performed sampling, date of analysis, name of person who performed analysis, QA/QC data, method detection limits, analytical methods, copy of laboratory certification, and a perjury statement executed by the person responsible for the laboratory.
- N.** The Discharger shall calibrate and perform maintenance procedures on all monitoring instruments and to insure accuracy of measurements, or shall insure that both equipment activities will be conducted.
- O.** The Discharger shall have, and implement, an acceptable written quality assurance (QA) plan for laboratory analyses. Unless otherwise specified in the analytical method, duplicate samples must be analyzed at a frequency of 5% (1 in 20 samples) with at least one if there are fewer than 20 samples in a batch. A batch is defined as a single analytical run encompassing no more than 24 hours from start to finish. A similar frequency shall be maintained for analyzing spiked samples.
- P.** The Discharger shall ensure that the results of the Discharge Monitoring Report-Quality Assurance (DMR-QA) Study or the most recent Water Pollution Performance Evaluation Study are submitted annually to the State Water Board at the following address:
 - State Water Resources Control Board
 - Quality Assurance Program Officer
 - Office of Information Management and Analysis
 - 1001 I Street,
 - Sacramento, CA 95814
- Q.** For parameters that both average monthly and maximum daily limits are specified and the monitoring frequency is less than four times a month, the following shall apply. If an analytical result is greater than the average monthly limit, the Discharger may collect four additional samples at approximately equal intervals during the month, until compliance with the average monthly limit has been demonstrated. All five analytical results shall be reported in the monitoring report for that month, or 45 days after results for the additional samples were received, whichever is later. In the event of noncompliance with an average monthly effluent limitation, the sampling frequency for that constituent may be increased to weekly and may continue at this level until compliance with the average monthly effluent limitation has been demonstrated. The Discharger shall provide for the approval of the Executive Officer a program to ensure future compliance with the average monthly limit.
- R.** In the event wastes are transported to a different disposal site during the reporting period, the following shall be reported in the monitoring report:
 - 1. Types of wastes and quantity of each type;
 - 2. Name and address for each hauler of wastes (or method of transport if other than by hauling); and
 - 3. Location of the final point(s) of disposal for each type of waste.

If no wastes are transported off-site during the reporting period, a statement to that effect shall be submitted.

- S. Each monitoring report shall state whether or not there was any change in the discharge as described in the Order during the reporting period.

II. MONITORING LOCATIONS

The Discharger shall establish the following monitoring locations to demonstrate compliance with the effluent limitations, discharge specifications, and other requirements in this Order:

Table E-1. Monitoring Station Locations

Discharge Point Name	Monitoring Location Name	Monitoring Location Description
Effluent and Sediment Monitoring Station		
001	EFF-001	A location where a representative sample of effluent can be obtained from Discharge Point 001 at <i>LAI Last Chance Basin</i> , prior to discharging into the storm drain.
002	EFF-002	A location where a representative sample of effluent can be obtained from Discharge Point 002 at <i>Dabney-Lloyd Basin</i> , prior to discharging into the storm drain.
003	EFF-003	A location where a representative sample of effluent can be obtained from Discharge Point 003 at <i>Stocker Basin</i> , prior to discharging into the storm drain.
004	EFF-004	A location where a representative sample of effluent can be obtained from Discharge Point 004 at <i>Vickers – I Basin</i> , prior to discharging into the storm drain.
005	EFF-005	A location where a representative sample of effluent can be obtained from Discharge Point 005 at <i>Lower Vickers – II Basin</i> , prior to discharging into the storm drain.
006	EFF-006	A location where a representative sample of effluent can be obtained from Discharge Point 006 at <i>Upper Vickers – II Basin</i> , prior to discharging into the storm drain.
Receiving Water Monitoring Station		
--	RSW-001	A location above all Discharge Points in Ballona Creek and below National Boulevard where a representative sample can be obtained.
--	RSW-002	A location above Sawtelle Boulevard and below all Discharge Points in Ballona Creek where a representative sample can be obtained.
--	RSW-003	A location in the vicinity and upstream of Discharge Point 003 (Stocker Basin) in Centinela Creek where a representative sample can be obtained.
--	RSW-004	A location in the vicinity of West Jefferson Boulevard in Centinela Creek where a representative sample can be obtained.
--	RSW-005	The Los Angeles County Department of Public Works' Stream Gauge station F38C-R. The stream flow data may be obtained by contacting LACDPW at (626) 458-5100 or through Mr. Arthur Gotingco at (626) 458-6379 or at agoting@dpw.lacounty.gov . The data for this station is downloaded once a month with a 1-2 week processing time for the provisional data.

III. INFLUENT MONITORING REQUIREMENTS – NOT APPLICABLE

IV. EFFLUENT MONITORING REQUIREMENTS

A. Monitoring Locations EFF-001, EFF-002, EFF-003, EFF-004, EFF-005 and EFF-006

1. The Discharger shall monitor discharges from Discharge Points 001 through 006 at Monitoring Locations EFF-001 through 006 as follows. If more than one analytical test method is listed for a given parameter, the Discharger must select from the listed methods and corresponding minimum level.

Table E-2a. Effluent Monitoring at Monitoring Locations EFF-001 through 006

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Test Method
Flow ¹	Gallons/day	Meter	1/Discharge Event	--
Conventional Pollutants				
Biochemical Oxygen Demand (BOD ₅) 5-day @ 20°C ²	mg/L	Grab	1/Discharge Event ³	5
Oil and Grease ²	mg/L	Grab	1/Discharge Event ³	5
pH	standard units	Grab	1/Discharge Event ³	5, 6
Total Suspended Solids (TSS) ²	mg/L	Grab	1/Discharge Event ³	5
Non-conventional Pollutants				
Ammonia, Total (as N) ²	mg/L	Grab	1/Year ⁴ (First discharge of the year)	5
Chronic Toxicity	Pass or Fail, and % effect (TST approach)	Grab	1/Year ⁴ (First discharge of the year)	5, 7, 8
<i>E. Coli</i>	CFU/100mL or MPN/100mL	Grab	1/Discharge Event ³	5, 9
Methyl Tertiary Butyl Ether (MTBE)	µg/L	Grab	1/Year ⁴ (First discharge of the year)	5
Nitrate (as N)	mg/L	Grab	1/Year ⁴ (First discharge of the year)	5
Nitrite (as N)	mg/L	Grab	1/Year ⁴ (First discharge of the year)	5
Nitrite plus nitrate, Total (as N)	mg/L	Grab	1/Year ⁴ (First discharge of the year)	5
Phenols ²	mg/L	Grab	1/Year ⁴ (First discharge of the year)	5
Settleable Solids	ml/L	Grab	1/Discharge Event ³	5
Temperature	°F	Grab	1/Discharge Event ³	5, 6
Total Petroleum Hydrocarbons (TPH) as Gasoline (C ₄ -C ₁₂) ^{2, 10}	µg/L	Grab	1/Discharge Event ³	EPA Method 8015B
TPH as Diesel (C ₁₃ -C ₂₂) ^{2, 10}	µg/L	Grab	1/Discharge Event ³	EPA method 8015B

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Test Method
TPH as Waste Oil (C ₂₃₊) ^{2, 10}	µg/L	Grab	1/Discharge Event ³	EPA method 8015B
Turbidity	NTU	Grab	1/Discharge Event ³	5
Priority Pollutants				
Copper, Total Recoverable ²	µg/L	Grab	1/Discharge Event ³	5
Lead, Total Recoverable ²	µg/L	Grab	1/Discharge Event ³	5
Mercury, Total Recoverable ²	µg/L	Grab	1/Discharge Event ³	5
Selenium, Total Recoverable ²	µg/L	Grab	1/Discharge Event ³	5
Zinc, Total Recoverable ²	µg/L	Grab	1/Discharge Event ³	5
Cyanide, Total ²	µg/L	Grab	1/Discharge Event ³	5
Bis(2-Ethylhexyl)Phthalate ²	µg/L	Grab	1/Discharge Event ³	5
TCDD Equivalents ¹²	µg/L	Grab	1/Year ⁴ (First discharge of the year)	5
Remaining Priority Pollutants ¹¹ (excluding asbestos)	µg/L	Grab	1/Year ⁴ (First discharge of the year)	5

- ¹ Flow shall be recorded daily during each period of discharge. Periods of no flow shall also be reported.
- ² The mass emission (lbs/day) for the discharge shall be calculated and reported using the pollutant concentration and the actual flow rate measured at the time of discharge, using the formula:

$$M = 8.34 \times C \times Q$$
 where: M = mass discharge for a pollutant (lbs/day)
 C = Reported concentration for a pollutant (mg/L)
 Q = actual discharge flow rate (MGD).
- ³ During periods of extended discharge, no more than one sample per week (or 7-day period) is required to be collected. Sampling shall be conducted during the first hour of discharge. If, for safety reasons, a sample cannot be obtained during the first hour of discharge, a sample shall be obtained at the first safe opportunity, and the reason for the delay shall be included in the report. If there is no discharge to surface water, then no monitoring is required. In the corresponding monitoring report, the Discharger shall indicate under penalty of perjury that no effluent was discharged to surface water during the reporting period.
- ⁴ Monitoring is only required during years in which a discharge occurs. Annual samples shall be collected during the first discharge of the year. In the corresponding monitoring report, the Discharger shall indicate under penalty of perjury that no effluent was discharged to surface water during the reporting period.
- ⁵ Pollutants shall be analyzed using the analytical methods described in 40 C.F.R. part 136; for priority pollutants, the methods must meet the lowest MLs specified in Attachment 4 of the SIP, provided as Attachment H in this Order Where no methods are specified for a given pollutant, the methods must be approved by the Regional Water Board or the State Water Board. If more than one analytical test method is listed for a given parameter, the Discharger must select a sufficiently sensitive method from the listed methods and corresponding ML necessary to demonstrate compliance with applicable effluent limitations.
- ⁶ A hand-held field meter may be used for pH and temperature, provided the meter utilizes an EPA-approved algorithm/method and is calibrated and maintained in accordance with the manufacturer’s instructions. A calibration and maintenance log for each meter used for monitoring required by this Monitoring and Reporting Program shall be maintained at the Facility.

- 7 For the first chronic toxicity sampling event under this Order, the Discharger shall conduct species sensitivity screening in accordance to section V.A.4 of this MRP. Thereafter, sampling shall be performed annually using the most sensitive species.
- 8 Refer to section V, Whole Effluent Toxicity Testing Requirements. The maximum daily single result shall be reported as “Pass” or “Fail” and “% Effect”.
- 9 Analytical methods used for *E. coli* shall be those presented in Table 1A of 40 C.F.R. part 136, unless alternate methods have been approved by U.S. EPA pursuant to 40 C.F.R. part 136 or improved methods have been determined by the Executive Officer and/or U.S. EPA.
- 10 The Discharger shall report the sum of TPH as Gasoline (C₄-C₁₂), TPH as Diesel (C₁₃-C₂₂), and TPH as Oil (C₂₃₊).
- 11 Priority Pollutants as defined by the California Toxics Rule (CTR) and in Attachment I to this Order.
- 12 TCDD equivalents shall be calculated using the following formula, where the MLs and the toxicity equivalency factors (TEFs) are as listed in the Table below. The Discharger shall report all measured values of individual congeners, including data qualifiers. When calculating TCDD equivalents, the Discharger shall set congener concentrations below the MLs to zero. U.S. EPA method 1613 may be used to analyze dioxin and furan congeners.

Dioxin-TEQ (TCDD equivalents) = $\sum(Cx \times TEFx)$
 where: Cx = concentration of dioxin or furan congener x
 TEFx= TEF for congener x

Congeners	Minimum Levels (pg/L)	Toxicity Equivalence Factor (TEF)
2,3,7,8 - tetra CDD	10	1.0
1,2,3,7,8 - penta CDD	50	1.0
1,2,3,4,7,8 - hexa CDD	50	0.1
1,2,3,6,7,8 - hexa CDD	50	0.1
1,2,3,7,8,9 - hexa CDD	50	0.1
1,2,3,4,6,7,8 - hepta CDD	50	0.01
Octa CDD	100	0.0001
2,3,7,8 - tetra CDF	10	0.1
1,2,3,7,8 - penta CDF	50	0.05
2,3,4,7,8 - penta CDF	50	0.5
1,2,3,4,7,8 - hexa CDF	50	0.1
1,2,3,6,7,8 - hexa CDF	50	0.1
1,2,3,7,8,9 - hexa CDF	50	0.1
2,3,4,6,7,8 - hexa CDF	50	0.1
1,2,3,4,6,7,8 - hepta CDFs	50	0.01
1,2,3,4,7,8,9 - hepta CDFs	50	0.01
Octa CDF	100	0.0001

- 2. The Discharger shall monitor effluent sediments (suspended solids) from Discharge Points 001 through 006 at Monitoring Locations EFF-001 through 006, respectively, as follows. The Discharger shall collect a sufficient volume of effluent water sample in order to obtain an adequate amount of effluent sediments for the sediment analyses.

Since the TSS concentration in the final discharge may be less than the TSS effluent limitation of 75 mg/L, a very large volume of effluent sample shall be collected in order to gather enough amount of sediments for the required analyses (metals and organics). Therefore, high resolution analytical methods (EPA approved) may be used to analyze specific constituents in the sediments. Within 90 days of the effective date of this Order, the Discharger may submit a work plan to the Regional Water Board for approval by the Executive Officer to analyze discharge sediments using high resolution analytical methods. The work plan shall include the proposed high resolution analytical methods for sediment analyses, the sampling protocols and the estimated volume of effluent required

for each analysis when using the proposed high resolution analytical method at a prespecified TSS level (less than 75 mg/L) in the effluent.

Table E-2b. Effluent Sediment Monitoring at Monitoring Locations EFF-001 through 006

Parameter	Units	Sample Type ¹	Minimum Sampling Frequency	Required Analytical Test Method
Cadmium, Total Recoverable	mg/kg	Grab	1/Year ¹ (First discharge of the year)	2
Copper, Total Recoverable	mg/kg	Grab	1/Year ¹ (First discharge of the year)	2
Lead, Total Recoverable	mg/kg	Grab	1/Year ¹ (First discharge of the year)	2
Silver, Total Recoverable	mg/kg	Grab	1/Year ¹ (First discharge of the year)	2
Zinc, Total Recoverable	mg/kg	Grab	1/Year ¹ (First discharge of the year)	2
Chlordane	µg/kg	Grab	1/Year ¹ (First discharge of the year)	2
DDTs ³	µg/kg	Grab	1/Year ¹ (First discharge of the year)	2
Total PCBs ⁴	µg/kg	Grab	1/Year ¹ (First discharge of the year)	2

¹ Monitoring is only required during years in which a discharge occurs. Annual samples shall be collected during the first discharge of the year. Sampling shall be performed during the first hour of discharge. If, for safety reasons, a sample cannot be obtained during the first hour of discharge, a sample shall be obtained at the first safe opportunity, and the reason for the delay shall be included in the report.

² Pollutants shall be analyzed in accordance with U.S. EPA or ASTM methodologies where such methods exist. Where no U.S. EPA or ASTM methods exist, the State Board or Regional Water Board shall approve the use of other methods. Analytical tests shall be conducted by laboratories certified by the State Water Board, Drinking Water Division, Environmental Laboratory Accreditation Program (ELAP) in accordance with Water Code section 13176.

³ The State Water Board Water Quality Control Plan for Enclosed Bays and Estuaries – Part 1 Sediment Quality, August 25, 2009, (known as Sediment Quality Plan, Attachment A) listed chemical analytes needed to characterize sediment contamination, exposure, and effect. According to the Sediment Quality Plan, DDTs shall mean the sum of 4,4’DDT, 2,4’DDT, 4,4’DDE, 2,4’DDE, 4,4’DDD and 2,4’DDD.

⁴ According to the Sediment Quality Plan, total PCBs (polychlorinated biphenyls) shall mean the sum of the following PCB congeners: 2,4’-dichlorobiphenyl, 2,2’,5’-trichlorobiphenyl, 2,4,4’-trichlorobiphenyl, 2,2’,3,5’-tetrachlorobiphenyl, 2,2’,5,5’-tetrachlorobiphenyl, 2,3’,4,4’-tetrachlorobiphenyl, 2,2’,4,5,5’-pentachlorobiphenyl, 2,3,3’,4,4’-pentachlorobiphenyl, 2,3’,4,4’,5’-pentachlorobiphenyl, 2,2’,3,3’,4,4’-hexachlorobiphenyl, 2,2’,3,4,4’,5’-hexachlorobiphenyl, 2,2’,4,4’,5,5’-hexachlorobiphenyl, 2,2’,3,3’,4,4’,5’-heptachlorobiphenyl, 2,2’,3,4,4’,5,5’-heptachlorobiphenyl, 2,2’,3,4’,5,5’,6’-heptachlorobiphenyl, 2,2’,3,3’,4,4’,5,6’-octachlorobiphenyl, 2,2’,3,3’,4,4’,5,5’,6’-nonachlorobiphenyl, and decachlorobiphenyl.

V. WHOLE EFFLUENT TOXICITY TESTING REQUIREMENTS

A. Chronic Toxicity Testing

1. Discharge In-stream Waste Concentration (IWC) for Chronic Toxicity

The chronic toxicity IWC for this discharge is **100 percent** effluent.

2. Sample Volume and Holding Time

The total sample volume shall be determined by the specific toxicity test method used. Sufficient sample volume shall be collected to perform both the required toxicity tests and

Toxicity Identification Evaluation (TIE) studies. All toxicity tests shall be conducted as soon as possible following sample collection. No more than 36 hours shall elapse before the conclusion of sample collection and test initiation.

3. Chronic Freshwater Species and Test Methods

If effluent samples are collected from outfalls discharging to receiving waters with salinity <1 ppt, the Discharger shall conduct the following chronic toxicity tests on effluent samples—at the in-stream waste concentration for the discharge—in accordance with species and test methods in *Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Freshwater Organisms* (EPA/821/R-02/013, 2002). In no case shall these species be substituted with another test species unless written authorization from the Regional Board Executive Officer is received.

- a. A static renewal toxicity test with the fathead minnow, *Pimephales promelas* (Larval Survival and Growth Test Method 1000.0).
- b. A static renewal toxicity test with the daphnid, *Ceriodaphnia dubia* (Survival and Reproduction Test Method 1002.0).
- c. A static renewal toxicity test with the green alga, *Selenastrum capricornutum* (also named *Raphidocelis subcapitata*) (Growth Test Method 1003.0).

4. Species Sensitivity Screening

Species sensitivity screening shall be conducted during this Order's first required sample collection. The Discharger shall collect a single effluent sample and concurrently conduct three toxicity tests, using the fish, an invertebrate, and the alga species as previously referenced in this section. The sample shall also be analyzed for the parameters required for the discharge as listed in Table E-2a. The species that exhibits the highest "Percent Effect" at the discharge IWC during species sensitivity screening shall be used for routine annual monitoring during the permit cycle.

Rescreening is required at least once per five (5) years. The Discharger shall rescreen with the three species listed above and continue to monitor with the most sensitive species. If the first suite of rescreening tests demonstrates that the same species is the most sensitive, then the rescreening does not need to include more than one suit of tests. If a different species is the most sensitive, or if there is ambiguity, then the Discharger shall proceed with suites of screening tests using enough collected effluent for a minimum of three, but not to exceed five suites.

5. Quality Assurance and Additional Requirements

Quality assurance measures, instructions, and other recommendations and requirements are found in the test methods manuals previous referenced. Additional requirements are specified below.

- a. The discharge is subject to a determination of "Pass" or "Fail" and "Percent Effect" from a single-effluent concentration chronic toxicity test at the discharge IWC using the Test of Significant Toxicity (TST) statistical approach described in *National Pollutant Discharge Elimination System Test of Significant Toxicity/Implementation Document* (EPA 833-R-10-003, 2010), Appendix A, Figure A-1, and Table A-1. The null hypothesis (H_0) for the TST statistical approach is: Mean discharge IWC response \leq (0.75 x Mean control response). A test result that does not reject this null hypothesis is reported as "Fail". The relative "Percent Effect" at the discharge IWC is defined and reported as: $((\text{Mean control response} - \text{Mean discharge IWC response}) \div \text{Mean control response}) \times 100\%$.

- b. If the effluent toxicity test does not meet all test acceptability criteria (TAC) specified in the referenced test method, then the Discharger must re-sample and re-test for the subsequent discharge event.
 - c. Dilution water and control water, including brine controls, shall be laboratory water prepared and used as specified in the test methods manual. If dilution water and control water is different from test organism culture water, then a second control using culture water shall also be used.
 - d. Monthly reference toxicant testing is sufficient. All reference toxicant test results should be reviewed and reported. Reference toxicant tests and effluent toxicity tests shall be conducted using the same test conditions (e.g., same test duration, etc.).
 - e. The Discharger shall perform toxicity tests on final effluent samples. Chlorine and ammonia shall not be removed from the effluent sample prior to toxicity testing, unless explicitly authorized under this section of the Monitoring and Reporting Program and the rationale is explained in the Fact Sheet (Attachment F).
- 6. Preparation of Initial Investigation Toxicity Reduction Evaluation (TRE) Work Plan**

The Discharger shall prepare and submit a generic Initial Investigation TRE Work Plan within 90 days of the permit effective date to be ready to respond to toxicity events. The Discharger shall review and update this work plan as necessary so it remains current and applicable to the discharge. At a minimum, the work plan shall include:

- a. A description of the investigation and evaluation techniques that would be used to identify potential causes and source of toxicity, effluent variability, and treatment system efficiency.
 - b. A description of methods for maximizing in-house treatment system efficiency, good housekeeping practices, and a list of all chemicals used in operations at the Facility.
 - c. If a Toxicity Identification Evaluation (TIE) is necessary, an indication of who would conduct the TIEs (i.e., an in-house expert or outside contractor).
- 7. Toxicity Identification Evaluation and Toxicity Reduction Evaluation Process**

- a. **Toxicity Identification Evaluation (TIE).** A toxicity test sample is immediately subject to TIE procedures to identify the toxic chemical(s), if a chronic toxicity test shows "Fail and % Effect value ≥ 50 ". The Discharger shall initiate a TIE using, as guidance, EPA manuals: *Methods for Aquatic Toxicity Identification Evaluations: Phase I Toxicity Characterization Procedures* (EPA/600/6-91/003, 1991); *Methods for Aquatic Toxicity Identification Evaluations, Phase II Toxicity Identification Procedures for Samples Exhibiting Acute and Chronic Toxicity* (EPA/600/R-92/080, 1993); *Methods for Aquatic Toxicity Identification Evaluations, Phase III Toxicity Confirmation Procedures for Samples Exhibiting Acute and Chronic Toxicity* (EPA/600/R-92/081, 1993); and *Marine Toxicity Identification Evaluation (TIE): Phase I Guidance Document* (EPA/600/R-96-054, 1996). The TIE should be conducted on the species demonstrating the most sensitive toxicity response.
- b. **Toxicity Reduction Evaluation (TRE).** When a toxicant or class of toxicants is identified, a TRE shall be performed for that toxicant. The TRE shall include all reasonable steps to identify the source(s) of toxicity and discuss appropriate BMPs to eliminate the causes of toxicity. No later than 30 days after the source of toxicity and appropriate BMPs and/or treatment are identified, the Discharger shall submit a TRE Corrective Action Plan to the Executive Officer for approval. At minimum, the plan shall include:
 - i. The potential sources of pollutant(s) causing toxicity.

- ii. Recommended BMPs and/or treatment to reduce the pollutant(s) causing toxicity.
 - iii. Follow-up monitoring to demonstrate that toxicity has been removed.
 - iv. Actions the Discharger will take to mitigate the effects of the discharge and prevent the recurrence of toxicity.
 - v. A schedule for these actions, progress reports, and the final report.
- c. Many recommended TRE elements parallel required or recommended efforts for source control, pollution prevention, and storm water control programs. TRE efforts should be coordinated with such efforts. As toxic substances are identified or characterized, the Discharger shall continue the TRE by determining the sources and evaluating alternative strategies for reducing or eliminating the substances from the discharge. All reasonable steps shall be taken to reduce toxicity to levels consistent with toxicity evaluation parameters.
 - d. The Discharger shall conduct routine effluent monitoring for the duration of the TIE/TRE process.
 - e. The Regional Water Board recognizes that toxicity may be episodic and identification of causes and reduction of sources of toxicity may not be successful in all cases. The TRE may be ended at any stage if monitoring finds there is no longer toxicity.

8. Reporting

The Self-Monitoring Report (SMR) shall include a full laboratory report for each toxicity test. This report shall be prepared using the format and content of the test methods manual chapter titled *Report Preparation*, including:

- a. The valid toxicity test results for the TST statistical approach, reported as “Pass” or “Fail” and “Percent Effect” at the chronic toxicity IWC for the discharge. All toxicity test results (whether identified as valid or otherwise) conducted during the calendar month shall be reported on the SMR due date specified in Table E-4.
- b. Water quality measurements for each toxicity test (e.g., pH, dissolved oxygen, temperature, conductivity, hardness, salinity, chlorine, ammonia).
- c. The statistical analysis used in *National Pollutant Discharge Elimination System Test of Significant Toxicity Implementation Document* (EPA 833-R-10-003, 2010) Appendix A, Figure A-1, Table A-1, and Appendix B, Table B-1.
- d. TRE/TIE results. The Regional Water Board Executive Officer shall be notified no later than 30 days from completion of each aspect of TRE/TIE analyses.
- e. Statistical program (e.g., TST calculator, CETIS, etc.) output results for each toxicity test.
- f. Tabular data and graphical plots clearly showing the laboratory’s performance for the reference toxicant for the previous 20 tests and the laboratory’s performance for the control mean, control standard deviation, and control coefficient of variation for the previous 12-month period.
- g. Any additional QA/QC documentation or any additional chronic toxicity-related information, upon request from the Regional Water Board Chief Deputy Executive Officer or the Executive Officer.

9. Ammonia Removal

Except with prior approval from the Executive Officer of the Regional Water Board, ammonia shall not be removed from bioassay samples. The Discharger must demonstrate the effluent toxicity is caused by ammonia because of increasing test pH when conducting

the toxicity test. It is important to distinguish the potential toxic effects of ammonia from other pH sensitive chemicals, such as certain heavy metals, sulfide, and cyanide. The following may be steps to demonstrate that the toxicity is caused by ammonia and not other toxicants before the Executive Officer would allow for control of pH in the test.

- a. There is consistent toxicity in the effluent and the maximum pH in the toxicity test is in the range to cause toxicity due to increased pH.
- b. Chronic ammonia concentrations in the effluent are greater than 4 mg/L total ammonia.
- c. Conduct graduated pH tests as specified in the toxicity identification evaluation methods. For example, mortality should be higher at pH 8 and lower at pH 6.
- d. Treat the effluent with a zeolite column to remove ammonia. Mortality in the zeolite treated effluent should be lower than the non-zeolite treated effluent. Then add ammonia back to the zeolite-treated samples to confirm toxicity due to ammonia.

When it has been demonstrated that toxicity is due to ammonia because of increasing test pH, pH may be controlled using appropriate procedures which do not significantly alter the nature of the effluent, after submitting a written request to the Regional Water Board, and receiving written permission expressing approval from the Executive Officer of the Regional Water Board.

10. Chlorine Removal

Except with prior approval from the Executive Office of the Regional Water Board, chlorine shall not be removed from bioassay samples.

VI. LAND DISCHARGE MONITORING REQUIREMENTS – NOT APPLICABLE

VII. RECYCLING MONITORING REQUIREMENTS – NOT APPLICABLE

VIII. RECEIVING WATER MONITORING REQUIREMENTS

A. Monitoring Locations RSW-001 and RSW-003

1. The Discharger shall monitor the Ballona Creek and the Centinela Creek at upstream monitoring locations RSW-001 and RSW-003 as follows, and include the coordinates of the location where each receiving water sample was collected in the corresponding monitoring report:

Table E-3a. Receiving Water Monitoring Requirements at Monitoring Locations RSW-001 and RSW-003

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Test Method
pH	standard units	Grab ¹	1/Year ²	3, 4
Ammonia Nitrogen, Total (as N)	mg/L	Grab ¹	1/Year ²	3
Dissolved Oxygen	mg/L	Grab ¹	1/Year ²	3, 4
Hardness, Total (as CaCO ₃)	mg/L	Grab ¹	1/Year ²	3
Temperature	°F	Grab ¹	1/Year ²	3, 4
Turbidity	NTU	Grab ¹	1/Year ²	3
Priority Pollutants ⁵ (excluding asbestos)	µg/L	Grab ¹	1/Year ²	3
TCDD Equivalents ⁶	µg/L	Grab ¹	1/Year ²	3

¹ The receiving water samples for all parameters including the Priority Pollutants must be collected at the same time. The receiving water samples shall be collected during the first hour of discharge if a discharge occurs with respect to the specific creek. If, for safety reasons, a sample cannot be obtained during the required time

period, a sample shall be obtained at the first safe opportunity, and the reason for the delay shall be included in the report.

- 2 Annual monitoring at each monitoring location is required. If no discharge to the surface water occurs during the first eleven (11) months of the year, the annual sampling may be conducted at any time in December.
- 3 Pollutants shall be analyzed using the analytical methods described in 40 C.F.R. part 136; for priority pollutants, the methods must meet the lowest MLs specified in Attachment 4 of the SIP, provided as Attachment H in this Order. Where no methods are specified for a given pollutant, the methods must be approved by this Regional Water Board or the State Water Board. If more than one analytical test method is listed for a given parameter, the Discharger must select from the listed methods and corresponding Minimum Level.
- 4 A hand-held field meter may be used for pH, dissolved oxygen and temperature, provided the meter utilizes an EPA-approved algorithm/method and is calibrated and maintained in accordance with the manufacturer's instructions. A calibration and maintenance log for each meter used for monitoring required by this Monitoring and Reporting Program shall be maintained at the Facility.
- 5 Priority Pollutants as defined by the California Toxics Rule (CTR) defined in Attachment I.
- 6 TCDD equivalents shall be calculated using the following formula, where the MLs and the toxicity equivalency factors (TEFs) are as listed in the Table below. The Discharger shall report all measured values of individual congeners, including data qualifiers. When calculating TCDD equivalents, the Discharger shall set congener concentrations below the MLs to zero. U.S. EPA method 1613 may be used to analyze dioxin and furan congeners.

$$\text{Dioxin-TEQ (TCDD equivalents)} = \sum(\text{Cx} \times \text{TEFx})$$

where: Cx = concentration of dioxin or furan congener x
 TEFx = TEF for congener x

Congeners	Minimum Levels (pg/L)	Toxicity Equivalence Factor (TEF)
2,3,7,8 - tetra CDD	10	1.0
1,2,3,7,8 - penta CDD	50	1.0
1,2,3,4,7,8 - hexa CDD	50	0.1
1,2,3,6,7,8 - hexa CDD	50	0.1
1,2,3,7,8,9 - hexa CDD	50	0.1
1,2,3,4,6,7,8 - hepta CDD	50	0.01
Octa CDD	100	0.0001
2,3,7,8 - tetra CDF	10	0.1
1,2,3,7,8 - penta CDF	50	0.05
2,3,4,7,8 - penta CDF	50	0.5
1,2,3,4,7,8 - hexa CDF	50	0.1
1,2,3,6,7,8 - hexa CDF	50	0.1
1,2,3,7,8,9 - hexa CDF	50	0.1
2,3,4,6,7,8 - hexa CDF	50	0.1
1,2,3,4,6,7,8 - hepta CDFs	50	0.01
1,2,3,4,7,8,9 - hepta CDFs	50	0.01
Octa CDF	100	0.0001

B. Monitoring Locations RSW-002 and RSW-004

1. The Discharger shall monitor the Ballona Creek and the Centinela Creek at downstream monitoring locations RSW-001 and RSW-003 as follows, and include the coordinates of the location where each receiving water sample was collected in the corresponding monitoring report:

Table E-3b. Receiving Water Monitoring Requirements at Monitoring Locations RSW-002 and RSW-004

Parameter	Units	Sample Type	Minimum Sampling Frequency	Required Analytical Test Method
pH	standard units	Grab	1/Semiannual period ^{1,2}	3, 4
Ammonia Nitrogen, Total (as N)	mg/L	Grab	1/Semiannual period ^{1,2}	3
Dissolved Oxygen	mg/L	Grab	1/Semiannual period ^{1,2}	3, 4
Temperature	°F	Grab	1/Semiannual period ^{1,2}	3, 4
Turbidity	NTU	Grab	1/Semiannual period ^{1,2}	3
E. coli	MPN/100ml or CFU/100ml	Grab	1/Semiannual period ^{1,2}	3
Hardness, Total (as CaCO ₃)	mg/L	Grab	1/Semiannual period ^{1,2}	3

- ¹ One of the receiving water samples shall be collected at approximately the same time the samples are collected at RSW-001 and RSW-003 and during the first hour of discharge if a discharge occurs. If, for safety reasons, a sample cannot be obtained during the required time period, a sample shall be obtained at the first safe opportunity, and the reason for the delay shall be included in the report.
- ² The semiannual monitoring at each monitoring location is required. If no discharge to the surface water occurs during the first five (5) months of any semiannual period, the semiannual receiving water sampling shall be conducted at any time in the last month (June or December) of the semiannual period.
- ³ Pollutants shall be analyzed using the analytical methods described in 40 C.F.R. part 136; for priority pollutants, the methods must meet the lowest MLs specified in Attachment 4 of the SIP, provided as Attachment H in this Order. Where no methods are specified for a given pollutant, the methods must be approved by this Regional Water Board or the State Water Board. If more than one analytical test method is listed for a given parameter, the Discharger must select from the listed methods and corresponding Minimum Level.
- ⁴ A hand-held field meter may be used for pH, dissolved oxygen and temperature, provided the meter utilizes an EPA-approved algorithm/method and is calibrated and maintained in accordance with the manufacturer's instructions. A calibration and maintenance log for each meter used for monitoring required by this Monitoring and Reporting Program shall be maintained at the Facility.

C. Monitoring Location RSW-005

For each day in which a discharge from the Facility occurs, the Discharger shall report the maximum daily flow (in cubic feet per second) in the Ballona Creek. Flow data for Ballona Creek is currently monitored between Sawtelle Boulevard and Sepulveda Boulevard by Los Angeles County Department of Public Works (LACDPW) at Stream Gage No. F38C-R. This station is designated as RSW-005 in this Order. This information is necessary to determine the wet weather and dry weather condition of the creek, as defined in the Ballona Creek Metals TMDL. Flow data can be obtained by contacting Mr. Arthur Gotingco (Tel: 626-458-6379; Email: agoting@dpw.lacounty.gov) at LACDPW. Data provided by LACDPW is provisional if the request is for current water year (October 1 through September 30) data and there is typically a 2-week period before the previous month's data is available due to processing and quality checking.

IX. OTHER MONITORING REQUIREMENTS

A. Rainfall Monitoring

The Discharger shall measure and record the rainfall on each day of the month or submit the data obtained from the nearest city/county operated rain gauge monitoring station. This information shall be included in the quarterly monitoring report.

B. Visual Observation

The Discharger shall make visual observations of all storm water discharge locations on at least one storm event per month that produces a significant storm water discharge to observe the presence of trash, floating and suspended materials, oil and grease, discoloration, turbidity, and odor. A "significant storm water discharge" is a continuous discharge of storm water for a minimum of one hour, or the intermittent discharge of storm water for a minimum of 3 hours in a 12-hour period.

X. REPORTING REQUIREMENTS

A. General Monitoring and Reporting Requirements

1. The Discharger shall comply with all Standard Provisions (Attachment D) related to monitoring, reporting, and recordkeeping.
2. If there is no discharge during any reporting period, the Discharger shall indicate under penalty of perjury in the corresponding monitoring report that no effluent was discharged to surface water during the reporting period.
3. If the Discharger conducts monitoring more frequently than required by this Order using approved analytical methods, the results of those analyses shall be included in the monitoring report. These results shall be reflected in the calculation of the average (or median) used in demonstrating compliance with this Order.
4. Each monitoring report shall contain a separate section titled "Summary of Non-Compliance" which discusses the compliance record and corrective actions taken or planned that may be needed to bring the discharge into full compliance with waste discharge requirements. This section shall clearly list all non-compliance with waste discharge requirements, as well as all excursions of effluent limitations.
5. The Discharger shall inform the Regional Water Board well in advance of any proposed construction activity that could potentially affect compliance with applicable requirements.
6. The Discharger shall report the results of chronic toxicity testing, TRE and TIE as required in the Attachment E, Monitoring and Reporting, section V.

B. Self-Monitoring Reports (SMRs)

1. The Discharger shall electronically submit SMRs using the State Water Board's California Integrated Water Quality System (CIWQS) Program website http://www.waterboards.ca.gov/water_issues/programs/ciwqs/. The CIWQS website will provide additional information for SMR submittal in the event there will be a planned service interruption for electronic submittal.
2. The Discharger shall report in the SMR the results for all monitoring specified in this MRP under sections III through IX. The Discharger shall submit quarterly SMRs including the results of all required monitoring using U.S. EPA-approved test methods or other test methods specified in this Order. SMRs are to include all new monitoring results obtained since the last SMR was submitted. If the Discharger monitors any pollutant more frequently than required by this Order, the results of this monitoring shall be included in the calculations and reporting of the data submitted in the SMR.
3. Monitoring periods and reporting for all required monitoring shall be completed according to the following schedule:

Table E-4. Monitoring Periods and Reporting Schedule

Sampling Frequency	Monitoring Period Begins On...	Monitoring Period	SMR Due Date
1/Discharge Event	April 1, 2018	One week (or any 7-day period)	Submit with quarterly SMR
1/Quarter	April 1, 2018	January 1 – March 31 April 1 – June 30 July 1 – September 30 October 1 - December 31	May 15 August 15 November 15 February 15
1/Semiannual period	April 1, 2018	January 1 – June 30 July 1 – December 31	August 15 February 15
1/Year	April 1, 2018	January 1 through December 31	February 15 of the following year

4. Reporting Protocols. The Discharger shall report with each sample result the applicable Reporting Level (RL) and the current Method Detection Limit (MDL), as determined by the procedure in 40 C.F.R. part 136.

The Discharger shall report the results of analytical determinations for the presence of chemical constituents in a sample using the following reporting protocols:

- a. Sample results greater than or equal to the RL shall be reported as measured by the laboratory (i.e., the measured chemical concentration in the sample).
 - b. Sample results less than the RL, but greater than or equal to the laboratory’s MDL, shall be reported as “Detected, but Not Quantified,” or DNQ. The estimated chemical concentration of the sample shall also be reported.
 - e. For the purposes of data collection, the laboratory shall write the estimated chemical concentration next to DNQ. The laboratory may, if such information is available, include numerical estimates of the data quality for the reported result. Numerical estimates of data quality may be percent accuracy (\pm a percentage of the reported value), numerical ranges (low to high), or any other means considered appropriate by the laboratory.
 - c. Sample results less than the laboratory’s MDL shall be reported as “Not Detected,” or ND.
 - d. Dischargers are to instruct laboratories to establish calibration standards so that the ML value (or its equivalent if there is differential treatment of samples relative to calibration standards) is the lowest calibration standard. At no time is the Discharger to use analytical data derived from extrapolation beyond the lowest point of the calibration curve.
- 5. Compliance Determination.** Compliance with effluent limitations for priority pollutants shall be determined using sample reporting protocols defined above and Attachment A of this Order. For purposes of reporting and administrative enforcement by the Regional Water Board and State Water Board, the Discharger shall be deemed out of compliance with effluent limitations if the concentration of the priority pollutant in the monitoring sample is greater than the effluent limitation and greater than or equal to the reporting level (RL).
- 6. Multiple Sample Data.** When determining compliance with an AMEL or MDEL for priority pollutants and more than one sample result is available, the Discharger shall compute the arithmetic mean unless the data set contains one or more reported determinations of “Detected, but Not Quantified” (DNQ) or “Not Detected” (ND). In those cases, the Discharger shall compute the median in place of the arithmetic mean in accordance with the following procedure:

- a. The data set shall be ranked from low to high, ranking the reported ND determinations lowest, DNQ determinations next, followed by quantified values (if any). The order of the individual ND or DNQ determinations is unimportant.
 - b. The median value of the data set shall be determined. If the data set has an odd number of data points, then the median is the middle value. If the data set has an even number of data points, then the median is the average of the two values around the middle unless one or both of the points are ND or DNQ, in which case the median value shall be the lower of the two data points where DNQ is lower than a value and ND is lower than DNQ.
7. The Discharger shall submit SMRs in accordance with the following requirements:
- a. The Discharger shall arrange all reported data in a tabular format. The data shall be summarized to clearly illustrate whether the facility is operating in compliance with interim and/or final effluent limitations. The Discharger is not required to duplicate the submittal of data that is entered in a tabular format within CIWQS. When electronic submittal of data is required and CIWQS does not provide for entry into a tabular format within the system, the Discharger shall electronically submit the data in a tabular format as an attachment.
 - b. The Discharger shall attach a cover letter to the SMR. The information contained in the cover letter shall clearly identify violations of the waste discharge requirements; discuss corrective actions taken or planned; and the proposed time schedule for corrective actions. Identified violations must include a description of the requirement that was violated and a description of the violation.

C. Discharge Monitoring Reports (DMRs)

1. DMRs are U.S. EPA reporting requirements. The Discharger shall electronically certify and submit DMRs together with SMRs using Electronic Self-Monitoring Reports module eSMR 2.5 or any upgraded version. Electronic DMR submittal shall be in addition to electronic SMR submittal. Information about electronic DMR submittal is available at the DMR website at:

http://www.waterboards.ca.gov/water_issues/programs/discharge_monitoring.

D. Other Reports

1. **Within 90 days** of the effective date of this permit, the Discharger is required to submit the following to the Regional Water Board:
 - a. Initial Investigation TRE workplan
 - b. Storm Water Pollution Prevention Plan (SWPPP)
 - c. Best Management Practices Plan (BMPP)
 - d. Spill Contingency Plan (SCP)

The SWPPP, BMPP, and SCP shall be reviewed at a minimum once per year and updated as needed to ensure all actual or potential sources of trash and pollutants discharged from the Facility are addressed. All changes or revisions to the SWPPP, BMPP, and SCP shall be submitted to the Regional Water Board within 30 days of revisions.

2. **Within 90 days** of the effective date of this permit, the Discharger shall submit a work plan detailing the use of the high resolution analytical methods in sediment analyses to the Regional Water Board for approval by the Executive Officer. The work plan shall include sampling protocols and proposed analytical methods and indicate results generated will be able to demonstrate the compliance with sediment limitations (WLAs in the Ballona Creek Estuary Toxic Pollutants TMDL) (see section IV.A.2. of the MRP).

ATTACHMENT F – FACT SHEET

As described in section II.B of this Order, the Regional Water Board incorporates this Fact Sheet as findings of the Regional Water Board supporting the issuance of this Order. This Fact Sheet includes the legal requirements and technical rationale that serve as the basis for the requirements of this Order.

This Order has been prepared under a standardized format to accommodate a broad range of discharge requirements for Dischargers in California. Only those sections or subsections of this Order that are specifically identified as “not applicable” have been determined not to apply to this Discharger. Sections or subsections of this Order not specifically identified as “not applicable” are fully applicable to this Discharger.

I. PERMIT INFORMATION

The following table summarizes administrative information related to the Facility.

Table F-1. Facility Information

WDID	4B192113018
Discharger	Sentinel Peak Resources California, LLC
Name of Facility	Inglewood Oil Field
Facility Address	5640 South Fairfax Avenue
	Los Angeles, CA 90056
	Los Angeles County
Facility Contact, Title and Phone	John Landgard, EH&S Manager, 323-298-2247
Authorized Person to Sign and Submit Reports	Christine Halley, Director of EH&S & Regulatory Affairs
Mailing Address	Same as Facility Address
Billing Address	Same as Facility Address
Type of Facility	Oil Field
Major or Minor Facility	Major
Threat to Water Quality	3
Complexity	C
Pretreatment Program	Not Applicable
Recycling Requirements	Not Applicable
Facility Permitted Flow	7.55 million gallons per day (MGD) at Discharge Points 001 to 006
Facility Design Flow	Not Applicable
Watershed	Ballona Creek
Receiving Water	Ballona Creek Reach 2, Centinela Creek
Receiving Water Type	Inland Surface Water

- A.** Sentinel Peak Resources California, LLC. (hereinafter, Discharger) is the owner and operator of the Inglewood Oil Field (hereinafter Facility or Field), an actively producing oil and gas field. Sentinel Peak Resources California, LLC. acquired the Field from Freeport-McMoRan Oil & Gas (FM O&G) on January 1, 2017. Plains Exploration & Production Company, the permittee in the prior order governing waste discharge from the Facility, Order No. R4-2013-0021, merged with and into FM O&G on May 31, 2013.

For the purposes of this Order, references to the “discharger” or “permittee” in applicable federal and state laws, regulations, plans, or policy are held to be equivalent to references to the Discharger herein.

- B. The Facility discharges storm water runoff to Ballona Creek Reach 2 and Centinela Creek, waters of the United States, within the Ballona Creek Watershed. The Discharger was previously regulated by Order No. R4-2013-0021 and National Pollutant Discharge Elimination System (NPDES) Permit No. CA0057827, adopted on February 7, 2013, which is scheduled to expire on January 10, 2018. Attachment B provides a map of the area around the Facility. Attachment C provides flow schematics of the Facility.
- C. The Discharger filed a report of waste discharge and submitted an application for reissuance of its waste discharge requirements (WDRs) and NPDES permit on July 14, 2017. The revised application was received on September 15, 2017. The application was deemed complete on October 3, 2017. A site visit was conducted on September 29, 2017, to observe operations at the Facility and to collect additional data to develop permit limitations and requirements.
- D. Regulations at 40 C.F.R. section 122.46 limit the duration of NPDES permits to a fixed term not to exceed five years. Accordingly, Table 3 of this Order limits the duration of the discharge authorization. However, pursuant to California Code of Regulations, title 23, section 2235.4, the terms and conditions of an expired permit are automatically continued pending reissuance of the permit if the Discharger complies with all federal NPDES requirements for continuation of expired permits.

II. FACILITY DESCRIPTION

The Inglewood Oil Field comprises approximately 900 acres and is located at 5640 South Fairfax Avenue in Los Angeles, California. Oil and gas exploration and production at the site dates back to the 1920's with over 1,600 wells drilled throughout the historical boundary of the site. Existing operations involve extracting oil and gas from subsurface reservoirs located between 800 and 10,000 feet below ground surface (bgs), removal of water from the crude oil and liquids from the gas. The crude oil is shipped through pipelines to Southern California refineries to be processed into gasoline and other products. The gas is shipped by pipeline to the SoCal Gas Company for use by consumers and industry or is shipped to refineries for use in the refining process. Industrial activities that are performed on the site include:

- Onshore oil production with oil dehydration/separation and oil storage/shipping facilities;
- Water treatment and injection facilities;
- Natural gas separation facilities and storage/handling of natural gas liquids;
- Total crude oil and produced water storage;
- Stormwater Treatment Systems; and,
- Biotreatment of contaminated soil.

The Inglewood Oil Field is located in the Baldwin Hills with elevations ranging from peaks higher than 500 feet East of La Cienega Boulevard, to as low as 100 feet at the northwest corner of the site. No perennial or intermittent streams, as defined by the U.S Geological Survey, are present within the Field boundaries. Six surface water retention basins are located along drainages within the Field boundaries to regulate discharges from the site. Surface runoff sheet flows across drilling pads, service roads, and various slopes to several interim basins and eventually to six surface water retention basins. The six retention basins are designed to retain oil on-site in an event of a spill and prevent oil spills from reaching the Los Angeles County storm drain system or surface water. The retention basin names and the related discharge points are:

Discharge Point	Retention Basin Name
001	LAI Last Chance Basin
002	Dabney-Lloyd Basin
003	Stocker Basin
004	Vickers - I Basin

Discharge Point	Retention Basin Name
005	Lower Vickers - II Basin
006	Upper Vickers - II Basin

A. Description of Wastewater Treatment and Controls

Storm water runoff and construction storm water within the Field are collected in the six retention basins described above. The facility utilizes a storm water treatment system at each basin to remove pollutants. The treatment system components include flocculation, settling, in-line clarification, and filtration. The Discharger continues to explore the appropriate storm water treatment system component(s) to be used at each basin based on the effluent characteristics with respect to each outfall. In addition to the treatment systems, Best Management Practices (BMPs) are in place to minimize the pollutant concentrations in the storm water runoff that drains to the six retention basins. Structural BMPs include containment berms, check dams, excelsior racks (Discharge Points 001, 002, 005 and 006) and numerous temporary BMPs (such as fiber rolls, etc). Further protection is provided at Discharge Points 003, 004 and 006 with discharge intake structures designed for oil-water separation.

The Discharger is required to implement BMPs that will effectively control the transport of pollutants associated with construction activities that will occur periodically in the Field. These BMPs will reduce pollutant concentrations in the storm water traversing the construction area prior to it entering the downstream retention basins. A description of the Field's BMPs is presented in the Storm Water Pollution Prevention Plan (SWPPP) dated April 2017.

B. Discharge Point and Receiving Water

Up to 7.55 MGD of storm water runoff is ultimately discharged into Ballona Creek (Reach 2) or Centinela Creek, waters of the United States, through Discharge Points 001 through 006. Runoff from six retention basins is first discharged to the Los Angeles County Department of Public Works storm drain system. Two of the basins (LAI Last Chance and Stocker) discharge through the storm drain system into Centinela Creek which is located approximately 1.2 miles southwest of the active field boundary. The Centinela Creek drains directly to Balolona Creek Estuary just below the boundary with Ballona Creek Reach 2. The other four basins (Dabney-Lloyd, Vickers - I, Lowers Vickers – II and Upper Vickers – II) discharge through the storm drain system to Ballona Creek Reach 2, which is located approximately 0.2 mile south of the active field boundary at the closest point. The locations of the Discharge Points, the permitted maximum runoff flows, and the receiving waters are listed below:

Discharge Point (Basin Name)	Latitude	Longitude	Maximum Rainfall Runoff Flow (mgd)	Receiving Water
001 (LAI Last Chance)	33.9894°	-118.3692°	0.666	Centinela Creek
002 (Dabney-Lloyd)	34.0144°	-118.3747°	3.06	Ballona Creek Reach 2
003 (Stocker)	34.9908°	-118.3611°	0.634	Centinela Creek
004 (Vickers - I)	34.0008°	-118.3842°	1.58	Ballona Creek Reach 2
005 (Lower Vicker - II)	34.0081°	-118.3867°	1.01	Ballona Creek Reach 2
006 (Upper Vickers - II)	34.0100°	-118.3867°	0.60	Ballona Creek Reach 2

C. Summary of Existing Requirements and Self-Monitoring Report (SMR) Data

Effluent limitations from Order No. R4-2013-0021 and monitoring results for Discharge Points 001 through 006 during the term of Order No. R4-2013-0021 are listed in Tables F-2a through F-2f.

Table F-2a. Historic Effluent Limitations and Monitoring Data – Discharge Point 001

Parameter	Units	Effluent Limitations		Maximum Daily of Reported Data (March 2013 through August 2017)
		Maximum Daily ¹	Interim Maximum Daily ²	
pH	s.u.	6.5 – 8.5 ³	--	6.8 – 8.25 ⁴
Temperature	°F	86 ⁵	--	74
Biochemical Oxygen Demand (5-day@20°C) (BOD)	mg/L	30	--	10.2
Oil and Grease	mg/L	15	--	1.7 ⁶
Phenols	mg/L	1.0	--	<0.025
Acute Toxicity	% survival	7		95 ⁸
Mercury, Total Recoverable (All-weather)	µg/L	0.10	--	<0.1
Copper, Total Recoverable (All-weather)	µg/L	23	41	58
Lead, Total Recoverable (All-weather)	µg/L	9.9	26	43
Selenium, Total Recoverable (All-weather)	µg/L	8.2	29	3.8
Zinc, Total Recoverable (All-weather)	µg/L	184	420	200

- ¹ These effluent limitations were prescribed in Order No. R4-2013-0021.
- ² Interim maximum daily effluent limitations are effective from February 7, 2013 to February 7, 2018 during the effective period of Time Schedule Order No. R4-2013-0022 and its amendment, TSO No. R4-2013-0022-A01.
- ³ Instantaneous minimum and maximum range.
- ⁴ Range of reporting data.
- ⁵ Instantaneous maximum.
- ⁶ Detected, but not quantified (DNQ) value. The result was an estimated value as it is detected greater than the method detection limit (MDL), but less than the minimum level (ML).
- ⁷ The acute toxicity of the effluent shall be such that:
 - i. The average survival in the undiluted effluent for any three (3) consecutive 96-hour static or continuous flow bioassay test shall be at least 90%, and
 - ii. No single test shall produce less than 70% survival.
- ⁸ Lowest survival of any single test.

Table F-2b. Historic Effluent Limitations and Monitoring Data – Discharge Point 002

Parameter	Units	Effluent Limitations		Maximum Daily of Reported Data (March 2013 through August 2017)
		Maximum Daily ¹	Interim Maximum Daily ²	
pH	s.u.	6.5 – 8.5 ³	--	6.6 – 8.35 ⁴

Parameter	Units	Effluent Limitations		Maximum Daily of Reported Data (March 2013 through August 2017)
		Maximum Daily ¹	Interim Maximum Daily ²	
Temperature	°F	86 ⁵	--	75.1
Biochemical Oxygen Demand (5-day@20°C) (BOD)	mg/L	30	--	11.8
Oil and Grease	mg/L	15	--	1.3 ⁶
Phenols	mg/L	1.0	--	ND (<0.025)
Acute Toxicity	% survival	7		93 ⁸
Mercury, Total Recoverable (All-weather)	µg/L	0.10	--	ND (<0.1)
Copper, Total Recoverable (Dry-weather)	µg/L	39	--	21.8
Lead, Total Recoverable (Dry-weather)	µg/L	21	--	3.9
Selenium, Total Recoverable (Dry-weather)	µg/L	8.2	--	ND (<2)
Zinc, Total Recoverable (Dry-weather)	µg/L	498	--	308
Copper, Total Recoverable (Wet-weather)	µg/L	18	30	57
Lead, Total Recoverable (Wet-weather)	µg/L	59	--	43
Selenium, Total Recoverable (Wet-weather)	µg/L	5.0	--	5.2
Zinc, Total Recoverable (Wet-weather)	µg/L	119	--	190

- ¹ These effluent limitations were prescribed in Order No. R4-2013-0021.
- ² Interim maximum daily effluent limitations are effective from February 7, 2013 to February 7, 2018 during the effective period of Time Schedule Order No. R4-2013-0022 and its amendment, TSO No. R4-2013-0022-A01.
- ³ Instantaneous minimum and maximum range.
- ⁴ Range of reporting data.
- ⁵ Instantaneous maximum.
- ⁶ Detected, but not quantified (DNQ) value. The result was an estimated value as it is detected greater than the method detection limit (MDL), but less than the minimum level (ML).
- ⁷ The acute toxicity of the effluent shall be such that:
 - i. The average survival in the undiluted effluent for any three (3) consecutive 96-hour static or continuous flow bioassay test shall be at least 90%, and
 - ii. No single test shall produce less than 70% survival.
- ⁸ Lowest survival of any single test.

Table F-2c. Historic Effluent Limitations and Monitoring Data – Discharge Point 003

Parameter	Units	Effluent Limitations		Maximum Daily of Reported Data (March 2013 through August 2017)
		Maximum Daily ¹	Interim Maximum Daily ²	
pH	s.u.	6.5 – 8.5 ³	--	7.7 – 8.6 ⁴

Parameter	Units	Effluent Limitations		Maximum Daily of Reported Data (March 2013 through August 2017)
		Maximum Daily ¹	Interim Maximum Daily ²	
Temperature	°F	86 ⁵	--	62

- 5 Instantaneous maximum.
- 6 Detected, but not quantified (DNQ) value. The result was an estimated value as it is detected greater than the method detection limit (MDL), but less than the minimum level (ML).
- 7 The acute toxicity of the effluent shall be such that:
 - i. The average survival in the undiluted effluent for any three (3) consecutive 96-hour static or continuous flow bioassay test shall be at least 90%, and
 - ii. No single test shall produce less than 70% survival.
- 8 Lowest survival of any single test.

Table F-2d. Historic Effluent Limitations and Monitoring Data – Discharge Point 004

Parameter	Units	Effluent Limitations		Maximum Daily of Reported Data (March 2013 through August 2017)
		Maximum Daily ¹	Interim Maximum Daily ²	
pH	s.u.	6.5 – 8.5 ³	--	7.4 ⁴
Temperature	°F	86 ⁵	--	58 ⁴
Biochemical Oxygen Demand (5-day@20°C) (BOD)	mg/L	30	--	3.7 ⁴
Oil and Grease	mg/L	15	--	1.3 ^{4, 6}
Phenols	mg/L	1.0	--	ND (<0.025) ⁴
Acute Toxicity	% survival	7		68 ^{4, 8}
Copper, Total Recoverable (Dry-weather)	µg/L	39	--	3.8 ⁴
Lead, Total Recoverable (Dry-weather)	µg/L	21	--	ND (<1) ⁴

Parameter	Units	Effluent Limitations		Maximum Daily of Reported Data (March 2013 through August 2017)
		Maximum Daily ¹	Interim Maximum Daily ²	
Selenium, Total Recoverable (Dry-weather)	µg/L	8.2	26	2 ⁴
Zinc, Total Recoverable (Dry-weather)	µg/L	498	--	15.3 ⁴
Copper, Total Recoverable (Wet-weather)	µg/L	18	--	NR
Lead, Total Recoverable (Wet-weather)	µg/L	59	--	NR
Selenium, Total Recoverable (Wet-weather)	µg/L	5.0	--	NR
Zinc, Total Recoverable (Wet-weather)	µg/L	119	--	NR

NR = Not Reported. There is no dry-weather discharge during the reporting period.

¹ These effluent limitations were prescribed in Order No. R4-2013-0021.

² Interim maximum daily effluent limitations are effective from February 7, 2013 to February 7, 2018 during the effective period of Time Schedule Order No. R4-2013-0022 and its amendment, TSO No. R4-2013-0022-A01.

³ Instantaneous minimum and maximum range.

⁴ There is only one discharge event during the reporting period. The reported data show the results of the only monitoring event occurred on February 7, 2017.

⁵ Instantaneous maximum.

⁶ Detected, but not quantified (DNQ) value. The result was an estimated value as it is detected greater than the method detection limit (MDL), but less than the minimum level (ML).

⁷ The acute toxicity of the effluent shall be such that:

- i. The average survival in the undiluted effluent for any three (3) consecutive 96-hour static or continuous flow bioassay test shall be at least 90%, and
- ii. No single test shall produce less than 70% survival.

⁸ Lowest survival of any single test.

Table F-2e. Historic Effluent Limitations and Monitoring Data – Discharge Point 005

Parameter	Units	Effluent Limitations		Maximum Daily of Reported Data (March 2013 through August 2017)
		Maximum Daily ¹	Interim Maximum Daily ²	
pH	s.u.	6.5 – 8.5 ³	--	NR

- ⁴ Range of reporting data.
- ⁵ Instantaneous maximum.
- ⁶ Detected, but not quantified (DNQ) value. The result was an estimated value as it is detected greater than the method detection limit (MDL), but less than the minimum level (ML).
- ⁷ The acute toxicity of the effluent shall be such that:
 - i. The average survival in the undiluted effluent for any three (3) consecutive 96-hour static or continuous flow bioassay test shall be at least 90%, and
 - ii. No single test shall produce less than 70% survival.
- ⁸ Lowest survival of any single test.

D. Compliance Summary

Based on data submitted to the Regional Water Board from March 2013 through August 2017, the Discharger has the following violations of numeric permit limitations:

Table F-3. Summary of Compliance History

Date Occurred	Monitoring Period	Discharge Point	Violations Type	Pollutant	Reported Value	Permit Limitation*	Units
02/28/2014	1 st Quarter 2014	003	Instantaneous Maximum	pH	8.6	8.5	s.u.
02/28/2014	1 st Quarter 2014	006	Instantaneous Maximum	pH	8.65	8.5	s.u.
02/28/2014	1 st Quarter 2014	001	Daily Maximum	Copper, Total Recoverable	58	41 (Interim limit)	µg/L
02/28/2014	1 st Quarter 2014	001	Daily Maximum	Lead, Total Recoverable	43	26 (Interim limit)	µg/L
02/28/2014	1 st Quarter 2014	002	Daily Maximum	Zinc, Total Recoverable	190	119	µg/L
02/28/2014	1 st Quarter 2014	002	Daily Maximum	Copper, Total Recoverable	57	30 (Interim limit)	µg/L
02/28/2014	1 st Quarter 2014	003	Daily Maximum	Lead, Total Recoverable	37	23 (Interim limit)	µg/L
02/28/2014	1 st Quarter 2014	003	Daily Maximum	Copper, Total Recoverable	48	30 (Interim limit)	µg/L
02/28/2014	1 st Quarter 2014	006	Daily Maximum	Mercury, Total Recoverable	0.2	0.1	µg/L
02/28/2014	1 st Quarter 2014	006	Daily Maximum	Lead, Total Recoverable	94	59	µg/L

Date Occurred	Monitoring Period	Discharge Point	Violations Type	Pollutant	Reported Value	Permit Limitation*	Units
02/28/2014	1 st Quarter 2014	006	Daily Maximum	Zinc, Total Recoverable	380	190	µg/L
09/15/2015	3 rd Quarter 2015	001	Daily Maximum	Copper, Total Recoverable	43.4	41 (Interim limit)	µg/L
09/15/2015	3 rd Quarter 2015	002	Daily Maximum	Copper, Total Recoverable	48.8	30 (Interim limit)	µg/L
09/15/2015	3 rd Quarter 2015	002	Daily Maximum	Zinc, Total Recoverable	154	119	µg/L
02/20/2017	1 st Quarter 2017	004	% survival	Acute Toxicity	68	70	%

* Interim limitations were established in TSO No. R4-2013-0022 and its amendment.

The Regional Water Board issued Settlement Offers R4-2015-0002 and R4-2016-0298 on January 7, 2015 and October 14, 2016, respectively, to address the violations listed above (but excluding the acute toxicity limit violation that occurred on February 20, 2017). The Discharger agreed to these Settlement Offers and delivered to the Regional Water Board signed letters of Acceptance of Conditional Resolution and Waiver of Right to Hearing. The required mandatory minimum penalties in the amount of \$21,000 and \$3,000 were received by the Regional Water Board on April 20, 2015 and December 28, 2016, respectively. Enforcement action is pending with regard to the acute toxicity limit violation that was not included in Settlement Offer R4-2016-0298.

The Facility was issued Time Schedule Order (TSO) R4-2013-0022 on February 7, 2013, because monitoring data indicated that the Facility could not consistently comply with the final effluent limitations for copper, lead, selenium and zinc at Discharge Points 001 through 006 as prescribed in Order R4-2013-0021. The TSO established interim effluent limitations and it required the Facility to undertake several tasks to achieve full compliance with the final effluent limitations as specified in Order R4-2013-0021. The Discharger has completed all of the requirements of this TSO. During the TSO implementation period, the Discharger discovered that the BMPs and other Facility modifications would not provide the level of treatment required to achieve compliance with the final effluent limitations. Per the Discharger's request, the Regional Water Board issued an amendment (TSO No. R4-2013-0022-A01) to Time Schedule Order No. R4-2013-0022 on September 15, 2016. This TSO amendment provides one-and-a-half years for the design, initial implementation, and installation of the storm water treatment systems at each retention basin. The TSO amendment will expire on February 7, 2018.

E. Planned Changes

The Discharger will evaluate the effectiveness of the storm water treatment components and install an appropriate storm water treatment system at each retention basin.

III. APPLICABLE PLANS, POLICIES, AND REGULATIONS

The requirements contained in this Order are based on the requirements and authorities described in this section.

A. Legal Authorities

This Order serves as WDRs pursuant to article 4, chapter 4, division 7 of the California Water Code (commencing with section 13260). This Order is also issued pursuant to section 402 of the federal Clean Water Act (CWA) and implementing regulations adopted by the U.S. EPA and chapter 5.5, division 7 of the Water Code (commencing with section 13370). It shall serve as

an NPDES permit authorizing the Discharger to discharge into waters of the United States at the discharge location described in Table 2 subject to the WDRs in this Order.

B. California Environmental Quality Act (CEQA)

Under Water Code section 13389, this action to adopt an NPDES permit is exempt from the provisions of Chapter 3 of CEQA, (commencing with section 21100) of Division 13 of the Public Resources Code.

C. State and Federal Laws, Regulations, Policies, and Plans

1. Water Quality Control Plan. Under federal law, all surface waters must have water quality standards designated in the Basin Plans, and most of the inland surface waters in the Region have beneficial uses specifically designated for them. The Regional Water Board adopted a *Water Quality Control Plan for the Los Angeles Region* (hereinafter Basin Plan) on June 13, 1994, that designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the Basin Plan. In addition, the Basin Plan implements State Water Board Resolution 88-63, which established state policy that all waters, with certain exceptions, should be considered suitable or potentially suitable for municipal or domestic supply (MUN). Requirements in this Order implement the Basin Plan.

The Basin Plan does not currently assign beneficial uses specific to the Centinela Creek. However, the Basin Plan states that *“waters not specifically listed (generally smaller tributaries), are designated with the same beneficial uses as the streams, lakes, or reservoirs to which they are tributary.”* Moreover, federal regulations that address state water quality standards are contained in 40 C.F.R. sections 131.2 and 131.10 and constitute a rebuttable presumption that beneficial uses supporting the *“fishable, swimmable”* goals of the federal CWA are attainable. In this case, there is no evidence to disprove attainability, and therefore recreation and aquatic life beneficial uses apply to the Centinela Creek. Because the Centinela Creek is a tributary of the Ballona Creek, the Regional Water Board finds that the beneficial uses identified in the Basin Plan for the Ballona Creek (Reach 2) are applicable to Centinela Creek. Furthermore, these beneficial uses support the *“fishable, swimmable”* goals of the CWA. Beneficial uses identified in the Basin Plan for Ballona Creek Reach 2 are as follows:

Table F-4. Basin Plan Beneficial Uses

Discharge Points	Receiving Water Name	Beneficial Use(s)
002, 004, 005 and 006	Ballona Creek Reach 2 (Estuary to National Blvd) (WBD No. 180701040300)	<u>Existing:</u> Limited water contact recreation (LREC-1), non-contact recreation (REC-2). <u>Potential:</u> Municipal and domestic water supply (MUN) ¹ , warm freshwater habitat (WARM), water contact recreation (REC-1) ² and wildlife habitat (WILD).
001 and 003	Centinela Creek, A tributary to Ballona Creek	<u>Same as above.</u>

¹ MUN designations are designated under State Water Board Resolution 88-63 and Regional Water Board Resolution 89-03. Some designations may be considered for exemption at a later date (See pages 2-3, 4 of the Basin Plan for more details).

² Access prohibited by Los Angeles County Department of Public Works.

2. High Flow Suspension. On July 10, 2003, the Regional Water Board adopted Resolution No. 2003-010 (High Flow Suspension) to suspend recreational beneficial uses in

engineered channels during unsafe weather conditions. The High Flow Suspension became effective on November 2, 2004. The High Flow Suspension applies to 1) water contact recreational activities associated with the swimmable goal as expressed in the federal Clean Water Act section 101(a)(2) and regulated under the REC-1 beneficial use, 2) non-contact water recreation involving incidental water contact regulated under the REC-2 beneficial use, and 3) associated bacteriological objectives set to protect those activities. Water quality objectives set to protect other recreational uses associated with the fishable goal as expressed in the federal CWA section 101(a)(2) and regulated under the REC-1 use, and other REC-2 uses (e.g., uses involving the aesthetic aspects of water) shall remain in effect at all times. The High Flow Suspension shall apply on days with rainfall greater than or equal to ½ inch and the 24 hours following the end of the ½-inch or greater rain event, as measured at the nearest local rain gage, using local Doppler radar, or using widely accepted rainfall estimation methods. The High Flow Suspension is applicable to Ballona Creek Reach 2 (Estuary to National Blvd).

3. **Thermal Plan.** The State Water Board adopted the Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Waters and Enclosed Bays and Estuaries of California (Thermal Plan) on January 7, 1971, and amended this plan on September 18, 1975. This plan contains temperature objectives for surface waters. Requirements of this Order implement the Thermal Plan and a white paper developed by Regional Water Board staff entitled *Temperature and Dissolved Oxygen Impacts on Biota in Tidal Estuaries and Enclosed Bays in the Los Angeles Region*. The white paper evaluated the optimum temperatures for aquatic species routinely available in surface water bodies within the Los Angeles Region including: steelhead, topsmelt, ghost shrimp, brown rock crab, jackknife clam, and blue mussel. A maximum effluent temperature limitation of 86°F was determined to be appropriate for protection of aquatic life and is included in this Order.
4. **National Toxics Rule (NTR) and California Toxics Rule (CTR).** U.S. EPA adopted the NTR on December 22, 1992, and later amended it on May 4, 1995, and November 9, 1999. About forty criteria in the NTR applied in California. On May 18, 2000, U.S. EPA adopted the CTR. The CTR promulgated new toxics criteria for California and, in addition, incorporated the previously adopted NTR criteria that were applicable in the state. The CTR was amended on February 13, 2001. These rules contain federal water quality criteria for priority pollutants.
5. **State Implementation Policy.** On March 2, 2000, the State Water Board adopted the *Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California* (State Implementation Policy or SIP). The SIP became effective on April 28, 2000, with respect to the priority pollutant criteria promulgated for California by the U.S. EPA through the NTR and to the priority pollutant objectives established by the Regional Water Board in the Basin Plan. The SIP became effective on May 18, 2000, with respect to the priority pollutant criteria promulgated by the U.S. EPA through the CTR. The State Water Board adopted amendments to the SIP on February 24, 2005, that became effective on July 13, 2005. The SIP establishes implementation provisions for priority pollutant criteria and objectives and provisions for chronic toxicity control. Requirements of this Order implement the SIP.
6. **Antidegradation Policy.** Federal regulation 40 C.F.R. section 131.12 requires that the state water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy in State Water Board Resolution 68-16 ("Statement of Policy with Respect to Maintaining High Quality of Waters in California"). Resolution 68-16 is deemed to incorporate the federal antidegradation policy where the federal policy applies under federal law. Resolution 68-16 requires that existing water quality be maintained unless degradation is justified based on

specific findings. The Regional Water Board's Basin Plan implements, and incorporates by reference, both the State and federal antidegradation policies. The permitted discharge must be consistent with the antidegradation provision of 40 C.F.R. section 131.12 and State Water Board Resolution 68-16.

7. **Anti-Backsliding Requirements.** Sections 402(o) and 303(d)(4) of the CWA and federal regulations at 40 C.F.R. section 122.44(l) restrict backsliding in NPDES permits. These anti-backsliding provisions require that effluent limitations in a reissued permit must be as stringent as those in the previous permit, with some exceptions in which limitations may be relaxed.
8. **Endangered Species Act Requirements.** This Order does not authorize any act that results in the taking of a threatened or endangered species or any act that is now prohibited, or becomes prohibited in the future, under either the California Endangered Species Act (Fish and Game Code, §§ 2050 to 2097) or the Federal Endangered Species Act (16 U.S.C.A. §§ 1531 to 1544). This Order requires compliance with effluent limits, receiving water limits, and other requirements to protect the beneficial uses of waters of the state, including protecting rare, threatened, or endangered species. The Discharger is responsible for meeting all requirements of the applicable Endangered Species Act.
9. **Trash Provisions.** The State Water Board adopted the "*Amendment to the Ocean Plan and Part I Trash Provisions of the Water Quality Control Plan for Inland Surface Waters, Enclosed Bays, and Estuaries of California*" (Trash Amendments) through Resolution 2015-0019, which was approved by OAL on December 2, 2015 and became effective upon U.S. EPA approval on January 12, 2016. The Trash Amendments established a narrative water quality objective for trash and a prohibition of the discharge of trash, implemented through permits issued pursuant to CWA section 402(p), waste discharge requirements, or waivers of waste discharge requirements.

The Trash Amendments apply to all surface waters of the State, with the exception of those waters within the jurisdiction of the Los Angeles Regional Water Board where trash or debris TMDLs are in effect prior to the effective date of the Trash Amendments. The Ballona Creek Trash TMDL was effective prior to the effective date of the Trash Amendments. However, the Ballona Creek Trash TMDL did not include any waste load allocations for minor NPDES permittees. As such, this Order implements the requirements of the Trash Provisions through the prohibition of trash discharges. This Order requires the Discharger to develop and implement an updated Storm Water Pollution Prevention Plan (SWPPP), which shall include specific BMPs used as storm water control measures that the Discharger will undertake to prevent the discharge of trash from the Facility to the Ballona Creek or the Centinela Creek. The Discharger is required to detail and submit to the Regional Water Board the updated SWPPP.

10. **Mercury Provisions.** The State Water Board adopted "Part 2 of the Water Quality Control Plan for Inland Surface Waters, Enclosed Bays, and Estuaries of California- Tribal and Subsistence Fishing Beneficial Uses and Mercury Provisions" (Mercury Provisions) through Resolution 2017-0027, which was approved by OAL on June 28, 2017 and became effective upon U.S. EPA approval on July 14, 2017. The Mercury Provisions established one narrative and four numeric water quality objectives for mercury and three new beneficial use definitions, implemented through NPDES permits issued pursuant to CWA section 402, waste discharge requirements, or waivers of waste discharge requirements. The Mercury Provisions are applicable to this Facility as the Ballona Creek Reach 2 has potential beneficial uses of Warm and Wild, and there is currently no TMDL or site specific objectives for mercury in Ballona Creek Reach 2. The Mercury Provisions included implementation requirements for individual non-storm water NPDES permits for

municipal and industrial dischargers; storm water discharges including the Municipal Separate Storm Sewer System (MS4) NPDES Permit and the General Permit for Storm Water Discharges Associated with Industrial Activities (Order NPDES No. CAS000001); mine site remediation; nonpoint source discharges; dredging activities; and wetland projects.

The Provisions did not prescribe specific implementation provisions for individual industrial permittees that discharge storm water only. However, requirements for mercury included in this Order is at least as stringent as and is consistent with the requirements included in the Provisions for industrial storm water dischargers regulated under the Industrial General Permit. The type of discharges regulated under the Industrial General Permit is similar to the Facility's discharge as the Facility also discharges storm water only from an industrial site. The Provisions for industrial storm water permittees regulated under the Industrial General Permit includes a revision to the mercury numeric action level (NAL) to 0.3 µg/L (300 ng/L) or lower. This Order establishes a water-quality based effluent limitation (WQBELs) for mercury expressed as a maximum daily effluent limitation of 0.1 µg/L (100 ng/L) for the protection of the human health criterion in the CTR, based on the presence of reasonable potential for mercury with consideration of effluent monitoring data submitted by the Discharger during the term of Order No. R4-2013-0021 (See section IV.C.3 of this Fact Sheet). Therefore, in achieving compliance with the mercury effluent limitation prescribed in this Order, the Discharger will be held to a treatment level that is at least as stringent as and comparable to that required of other industrial storm water dischargers in the Region. Compliance with the permit limitation will protect the mercury objectives set forth in the Provisions, and thus satisfy the requirement of the Mercury Provisions for industrial storm water discharges.

D. Impaired Water Bodies on the CWA section 303(d) List

Section 303(d) of the CWA requires states to identify specific water bodies where water quality standards are not expected to be met after implementation of technology-based effluent limitations on point sources. For all CWA section 303(d)-listed water bodies and pollutants, the Regional Water Board plans to develop and adopt total maximum daily loads (TMDLs) that will specify waste load allocations (WLAs) for point sources and load allocations (LAs) for non-point sources, as appropriate.

U.S. EPA approved the State's 2012 303(d) list of impaired water bodies on June 26, 2015. Certain receiving waters in the Los Angeles and Ventura County watersheds do not fully support beneficial uses and therefore have been classified as impaired on the 303(d) List of Water Quality Limited Segments (hereinafter 303(d) list) and have been scheduled for TMDL development. Ballona Creek is listed for coliform bacteria, copper (dissolved), cyanide, lead, selenium, toxicity, trash, virus (enteric) and zinc. The downstream, Ballona Creek Estuary, is listed for cadmium, chlordane (tissue & sediment), coliform bacteria, copper, DDT (tissue & sediment), lead (sediment), PAHs (sediment), PCBs (tissue & sediment), sediment toxicity, shellfish harvesting advisory, silver and zinc (sediment). The Ballona Creek Wetlands are listed for exotic vegetation, habitat alterations, hydromodification, reduced tidal flushing and trash.

Coliform bacteria, copper (dissolved), lead, selenium, toxicity, trash, virus (enteric) and zinc are addressed through TMDLs as detailed below. The TMDL to address cyanide is scheduled for completion by 2019.

- 1. Ballona Creek Metals TMDL.** The TMDL for metals in Ballona Creek was approved by the Regional Water Board on July 7, 2005 (Resolution NO. R05-007). The State Water Board approved the TMDL on October 20, 2005; OAL and U.S. EPA approvals were received on December 9, 2005 and December 22, 2005, respectively. The TMDL was subsequently amended by Resolutions No. R2007-015 that was adopted by the Regional

Water Board on September 6, 2007. State Water Board, OAL, and U.S. EPA approval occurred on June 17, 2008, October 6, 2008, and October 29, 2009, respectively. A recently revised metals TMDL, Resolution No. R13-010, was adopted by the Regional Water Board on December 5, 2013; State Water Board, OAL and U.S. EPA approvals were received on June 17, 2014, May 5, 2015 and October 26, 2015, respectively. It became effective on October 26, 2015. This revised metals TMDL designates WLAs for point sources to Ballona Creek.

The discharge from the Inglewood Oil Field has been classified as a major discharge on the basis of the number of points accumulated using the NPDES Permit Rating Work Sheet.

The Ballona Creek Metals TMDL includes specific WLAs for some of the major dischargers, the Los Angeles and the State of California Department of Transportation (CalTrans) MS4 permittees. However, no site specific WLA has been designated for the Inglewood Oil Field in the TMDL. In Attachment A to Resolution No. R13-010, on Page 5 in the section Waste Load Allocations (for point sources), paragraph 1 reads "Waste load allocations (WLA) are assigned to point sources for Ballona Creek and Sepulveda Canyon Channel. A grouped mass-based waste load allocation is developed for the storm water permittees (Los Angeles County MS4 permittees, Caltrans MS4 permittees, General Construction and General Industrial) by subtracting the load allocation from the total loading capacity. Concentration-based waste load allocations are developed for other point sources in the watershed." Inglewood Oil Field is a point source to Ballona Creek, one of the other point sources in the watershed which is referenced. Hence, the Facility requires an effluent limit developed using the appropriate WLA. The TMDL includes concentration-based dry-weather and wet weather WLA for other permits discharging to Ballona Creek. These concentration-based WLAs have been used to develop effluent limits for discharges from the Inglewood Oil Field. This permit implements the applicable WLAs as required in the TMDL, by applying the effluent limitation calculations provided in Section 1.4 of the SIP. Concentration-based WLAs were established for copper, lead and zinc for Discharge Point No. 002, 004, 005, and 006. This Metals TMDL for Ballona Creek is not applicable to the discharges to Centinela Creek because Centinela Creek is not listed as impaired for the targeted constituents and it flows into Ballona Creek Estuary.

2. **Ballona Creek Bacteria TMDL.** The Ballona Creek Bacteria TMDL was approved by the Regional Water Board on June 8, 2006 (Resolution NO. 2006-011). The State Water Board approved the TMDL on November 15, 2006; OAL and U.S. EPA approvals were received on February 22, 2007, and March 26, 2007, respectively. The TMDL was subsequently amended by Resolutions No. R12-008 that was adopted by the Regional Water Board on June 7, 2012. State Water Board, and OAL, approval occurred on March 19, 2013 and November 8, 2013, respectively. It became effective on July 2, 2014 upon the approval by U.S. EPA. This Bacteria TMDL will be implemented through the Los Angeles County Municipal Storm Water NPDES Permit (MS4), the Caltrans Storm Water Permit, any future Phase II MS4 permits, general NPDES permits, general industrial storm water permits, general construction storm water permits, and the authority contained in Sections 13263, 13267, and 13383. There are no WLA assigned to individual NPDES permittees. This permit requires bacterial monitoring of the effluent to ensure that the discharges do not cause or contribute to exceedances of bacteria loads in the receiving waters.
3. **Ballona Creek Trash TMDL.** The Ballona Creek Trash TMDL was adopted by the Regional Water Board on September 9, 2001. The TMDL established a numeric target of zero trash in Ballona Creek. The TMDL was to be implemented via storm water permits in a phased reduction for a period of 10 years. The Ballona Creek Trash TMDL was

approved by the State Water Board on February 19, 2002, the OAL on July 18, 2002, and by U.S. EPA on August 1, 2002. The TMDL became effective on August 28, 2002. The Regional Water Board made minor revisions to the TMDL and the Revised Ballona Creek Trash TMDL was adopted by the Regional Water Board on March 4, 2004 (Resolution No. 2004-0023). The State Water Board approved the TMDL on September 30, 2004 and OAL approved it on February 8, 2005. The Ballona Creek Trash TMDL became effective on August 11, 2005. The Ballona Creek Trash TMDL was further revised by the Regional Water Board on June 11, 2015 (Resolution No. R15-006). The State Water Board and OAL approved it on November 17, 2015, and May 4, 2016, respectively. It became effective upon approval by U.S. EPA on June 30, 2016. This Trash TMDL will be implemented through the LA County MS4 Permit and the Caltrans MS4 Permit.

This permit requires an updated SWPPP that shall include best management practices to prevent hazardous waste/material and trash from being discharged to waters of the United States. The appropriate implementation and maintenance of the best management practices will ensure that trash is not discharged from the Facility to Ballona Creek.

4. **Ballona Creek Estuary Toxic Pollutants TMDL.** The Ballona Creek Estuary Toxic Pollutants TMDL was approved by the Regional Water Board on July 7, 2005 (Resolution No. R05-008). The State Water Board approved the TMDL on October 20, 2005; OAL and U.S. EPA approvals were received on December 9, 2005, and December 22, 2005, respectively. This TMDL became effective on January 11, 2006. The TMDL was amended by Resolution No. R13-010 that was adopted by the Regional Water Board on December 5, 2013; State Water Board, and OAL approvals were received on June 17, 2014, and May 5, 2015, respectively. The revised TMDL became effective on October 26, 2015 upon approval by U.S. EPA. This Toxic Pollutants TMDL assigned concentration-based WLAs for pollutants concentrations in sediments for cadmium, copper, lead, silver, zinc, chlordane, DDTs, and total PCBs in the minor NPDES permits that regulate discharges to Ballona Creek or its tributaries. A WLA for total PAHs is not included in the revised TMDL because recent data indicate that PAHs are not present at levels exceeding existing numeric targets. This permit implements the applicable WLAs as required in this TMDL.

IV. RATIONALE FOR EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

The CWA requires point source dischargers to control the amount of conventional, non-conventional, and toxic pollutants that are discharged into the waters of the United States. The control of pollutants discharged is established through effluent limitations and other requirements in NPDES permits. There are two principal bases for effluent limitations in the Code of Federal Regulations (C.F.R.). 40 C.F.R. section 122.44(a) requires that permits include applicable technology-based limitations and standards; and 40 C.F.R. section 122.44(d) requires that permits include water quality-based effluent limitations (WQBELs) to attain and maintain applicable numeric and narrative water quality criteria to protect the beneficial uses of the receiving water.

Discharges from the Facility are primarily storm waters collected in six retention basins. Storm water runoff from the Facility could pick up solids, oil and grease-based compounds, and constituents contributing to biochemical oxygen demand (BOD). Further, total suspended solids (TSS), settleable solids, turbidity, oil and grease, pH, and BOD are pollutants typically used to characterize storm water discharges; therefore, these pollutants are considered pollutants of concern for discharges from the Facility. Since the Facility is an actively producing oil and gas field and monitoring data reported in the last permit term indicated the presence of total petroleum hydrocarbons (TPH) in the effluents, TPHs are also a pollutant of concern. In addition, the list of pollutants of concern includes constituents that were detected in the effluent and that are regulated in the Basin Plan, CTR or TMDLs.

Pursuant to 40 C.F.R. section 122.45(d), permit limitations for continuous discharges shall be expressed, unless impracticable, as both average monthly effluent limitations (AMELs) and maximum daily effluent limitations (MDELs). However, discharges through Discharge Points 001 through 006 consist of storm water only. They are intermittent and of short duration. Therefore, consistent with Order No. R4-2013-0021, only MDELs are included to ensure protection of the beneficial uses in the receiving waters.

Generally, mass-based effluent limitations ensure that proper treatment, and not dilution, is employed to comply with the final effluent concentration limitations. Section 122.45(f)(1) requires that all permit limitations, standards or prohibitions be expressed in terms of mass units except under the following conditions: (1) for pH, temperature, radiation or other pollutants that cannot appropriately be expressed by mass limitations; (2) when applicable standards or limitations are expressed in terms of other units of measure; or (3) if in establishing technology-based permit limitations on a case-by-case basis limitations based on mass are infeasible because the mass of pollutant cannot be related to a measure of production. The limitations, however, must ensure that dilution will not be used as a substitute for treatment.

A. Discharge Prohibitions

The discharge prohibitions enumerated in section III of the Waste Discharge Requirements of this Order are based on the requirements of the Basin Plan, State Water Board's plans and policies, the Water Code, federal law, and previous permit provisions. They are consistent with the requirements set for other discharges to the Ballona Creek that are regulated by NPDES permits.

B. Technology-Based Effluent Limitations

1. Scope and Authority

Section 301(b) of the CWA and implementing U.S. EPA permit regulations at 40 C.F.R. section 122.44 require that permits include conditions meeting applicable technology-based requirements at a minimum, and any more stringent effluent limitations necessary to meet applicable water quality standards. The discharge authorized by this Order must meet minimum federal technology-based requirements based on Best Professional Judgment (BPJ) in accordance with 40 C.F.R. section 125.3.

The CWA requires that technology-based effluent limitations be established based on several levels of controls:

- a. Best practicable treatment control technology (BPT) represents the average of the best existing performance by well-operated facilities within an industrial category or subcategory. BPT standards apply to toxic, conventional, and non-conventional pollutants.
- b. Best available technology economically achievable (BAT) represents the best existing performance of treatment technologies that are economically achievable within an industrial point source category. BAT standards apply to toxic and non-conventional pollutants.
- c. Best conventional pollutant control technology (BCT) represents the control from existing industrial point sources of conventional pollutants including BOD, TSS, fecal coliform, pH, and oil and grease. The BCT standard is established after considering a two-part reasonableness test. The first test compares the relationship between the costs of attaining a reduction in effluent discharge and the resulting benefits. The second test examines the cost and level of reduction of pollutants from the discharge from publicly owned treatment works to the cost and level of reduction of such

pollutants from a class or category of industrial sources. Effluent limitations must be reasonable under both tests.

- d. New source performance standards (NSPS) represent the best available demonstrated control technology standards. The intent of NSPS guidelines is to set limitations that represent state-of-the-art treatment technology for new sources.

The CWA requires U.S. EPA to develop effluent limitations, guidelines and standards (ELGs) representing application of BPT, BAT, BCT, and NSPS. Section 402(a)(1) of the CWA and 40 C.F.R. section 125.3 authorize the use of best professional judgment (BPJ) to derive technology-based effluent limitations on a case-by-case basis where ELGs are not available for certain industrial categories and/or pollutants of concern. Where BPJ is used, the Regional Water Board must consider specific factors outlined in 40 C.F.R. section 125.3.

2. Applicable Technology-Based Effluent Limitations (TBELs)

Currently, no numeric technology-based ELGs exist for storm water runoff from an oil and gas field. 40 C.F.R. section 435.32, the Onshore Subcategory of the Oil and Gas Extraction Point Source Category, includes requirements that are applicable to facilities engaged in the production, field exploration, drilling, well completion and well treatment in the onshore oil and gas extraction industry. 40 C.F.R. section 435.2 includes effluent limitations representing the degree of effluent reduction attainable by the application of the best practicable control technology currently available (BPT). It specifies "Except as provided in §§ 125.30 through 125.32, any existing point source subject to this subpart shall achieve the following effluent limitations representing the degree of effluent reduction attainable by application of the best practicable control technology currently available (BPT): there shall be no discharge of waste water pollutants into navigable waters from any source associated with production, field exploration, drilling, well completion, or well treatment (i.e., produced water, drilling muds, drill cuttings, and produced sand)." This Order does not permit the discharge of any waste water from onsite operations. The permitted discharge consists solely of storm water runoff from the site. The technology-based requirements in this Order are based on case-by-case numeric limitations developed using BPJ in accordance with 40 C.F.R. section 125.3. Technology-based effluent limitations as MDELs were established in Order No. R4-2013-0021 for biochemical oxygen demand (BOD), oil and grease, and phenols. As described below in section VI.D.1., this Order retains TBELs for BOD and oil and grease, but the TBELs for phenols have been removed consistent with antibacksliding requirements. In addition, MDELs were also established for settleable solids, turbidity and TPH based on BPJ because they are pollutants of concern for these types of discharges. These limitations are consistent with effluent limitations included in other Orders within the State for similar types of discharges and compliance with these limitations is not expected to require additional equipment as a storm water treatment system will be installed at each Discharge Point within the Field.

The current Order (R4-2013-0021) required the Discharger to develop and implement a Storm Water Pollution Prevention Plan (SWPPP). This Order requires the Discharger to update and continue to implement the SWPPP. The revised SWPPP will reflect current operations, treatment activities, and staff responsible for implementing and supporting the SWPPP. The SWPPP will outline site-specific management processes for minimizing storm water contamination and for preventing contaminated storm water from being discharged directly into the storm drain. At a minimum, the management practices should ensure that raw materials and chemicals do not come into contact with storm water. The SWPPP shall also outline management practices to eliminate the discharge of trash entrained in storm water discharged from the Facility. This Order requires the SWPPP be consistent with requirements in Attachment G.

This Order requires the Discharger to update and continue to implement a Best Management Practices Plan (BMPP) which may be included in the SWPPP. 40 C.F.R. section 122.44(k) requires that permits include best management practices when reasonably necessary to achieve the effluent limitations and standards or to carry out the purpose and intent of the CWA. Consistent with 40 C.F.R. Part 122.44(k), this Order requires the Discharger to update and continue to implement a BMPP. The purpose of the BMPP is to establish site-specific procedures that minimize the potential to discharge hazardous waste/materials and other contaminants including trash to surface waters.

The BMPP shall be consistent with the general guidance contained in the U.S. EPA *Guidance Manual for Developing Best Management Practices (BMPs)* (EPA 833-B-93-004). The BMPP shall cover all areas of the Facility and shall include an updated drainage map for the Facility. Further, the BMPP shall identify on a map of appropriate scale the areas that generate effluent and runoff at the permitted discharge points; describe the activities in each area, the potential for contamination of the effluent and storm water. The BMPP shall also identify the responsible individuals for the implementation of the BMPP by name, job title, job duties, and phone number.

An up-to-date SWPPP shall be submitted to the Regional Water Board within 90 days of the effective date of this Order. The SWPPP shall be reviewed annually and at the same time each year. Revisions of the SWPPP shall be submitted to the Regional Water Board within 30 days of any change.

This Order also requires the Discharger to update and continue to implement their Spill Prevention Control and Countermeasure (SPCC) Plan.

The combination of the SWPPP, BMPP, SPCC Plan, and permit limitations based on past performance and reflecting BPJ will serve as the equivalent of technology based effluent limitations, in the absence of established ELGs, in order to carry out the purposes and intent of the CWA.

A summary of the numeric technology-based effluent limitations is provided in Table F-5.

Table F-5. Technology-based Effluent Limitations for Discharge Points 001 through 006

Parameter	Units	Effluent Limitations
Biochemical Oxygen Demand (BOD) (5-day @ 20°C)	mg/L	30
Oil and Grease	mg/L	15
Settleable Solids	ml/L	0.3
Total Petroleum Hydrocarbons (TPH)*	µg/L	100
Turbidity	NTU	75

*. TPH equals the sum of TPH gasoline (C4-C12), TPH diesel (C13-C22), and TPH waste oil (C23+). The limitation was based on the taste and odor threshold of 100 µg/L for diesel in the 1980 U.S. EPA Suggested-No-Adverse-Response Level.

C. Water Quality-Based Effluent Limitations (WQBELs)

1. Scope and Authority

CWA section 301(b) and 40 C.F.R. section 122.44(d) require that permits include limitations more stringent than applicable federal technology-based requirements where necessary to achieve applicable water quality standards.

40 C.F.R. section 122.44(d)(1)(i) requires that permits include effluent limitations for all pollutants that are or may be discharged at levels that have the reasonable potential to

cause or contribute to an exceedance of a water quality standard, including numeric and narrative objectives within a standard. Where reasonable potential has been established for a pollutant, but there is no numeric criterion or objective for the pollutant, WQBELs must be established using: (1) U.S. EPA criteria guidance under CWA section 304(a), supplemented where necessary by other relevant information; (2) an indicator parameter for the pollutant of concern; or (3) a calculated numeric water quality criterion, such as a proposed state criterion or policy interpreting the state's narrative criterion, supplemented with other relevant information, as provided in section 122.44(d)(1)(vi). WQBELs must also be consistent with the assumption and requirements of TMDL WLAs approved by U.S. EPA.

The process for determining reasonable potential and calculating WQBELs when necessary is intended to protect the designated beneficial uses of the receiving water as specified in the Basin Plan, and achieve applicable water quality objectives and criteria that are contained in other state plans and policies, or any applicable water quality criteria contained in the CTR and NTR.

The specific procedures for determining reasonable potential and, if necessary, for calculating WQBELs are contained in the Technical Support Document (TSD) for storm water discharges and in the SIP for non-storm water discharges. However, Section 3.3.8 of the TSD states that "an analogous approach developed by a regulatory authority can be used to determine the reasonable potential" (for storm water discharges). The Regional Water Board has determined that the procedures for determining reasonable potential and calculating WQBELs contained in the SIP for non-storm water discharges may also be used to evaluate reasonable potential and calculate WQBELs for storm water discharges. Hence, in this Order, the Regional Water Board has used the SIP methodology to evaluate reasonable potential for storm water discharges through Discharge Points 001 through 006.

2. Applicable Beneficial Uses and Water Quality Criteria and Objectives

As noted in section III of the Fact Sheet, the Regional Water Board adopted a Basin Plan that designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the Basin Plan. The beneficial uses applicable to the Ballona Creek Reach 2 are summarized in section III.C.1 of this Fact Sheet. The Basin Plan includes both narrative and numeric water quality objectives applicable to the receiving water.

Priority pollutant water quality criteria in the CTR are applicable to Ballona Creek as well as Centinela Creek. The CTR contains both saltwater and freshwater criteria. Because a distinct separation generally does not exist between freshwater and saltwater aquatic communities, the following apply, in accordance with section 131.38(c)(3); freshwater criteria apply at salinities of 1 part per thousand (ppt) and below at locations where this occurs 95 percent or more of the time. The Regional Water Board has determined that freshwater criteria applies to the Ballona Creek Reach 2. The CTR criteria for freshwater or human health for consumption of organisms, whichever is more stringent, are used to prescribe the effluent limitations in this Order to protect the beneficial uses of Ballona Creek Reach 2 and Centinela Creek, waters of the United States.

Some water quality criteria are hardness dependent. The Discharger is required to monitor the hardness of the receiving waters (Ballona Creek and Centinela Creek). The Discharger reported six (6) wet-weather hardness results (82, 82.1, 108, 22.6, 48.8, 59.2) and four (4) dry-weather hardness results (182, 151, 185, 204) at Centinela Creek monitoring station, RSW-004, during the last permit term. From November 2015 to December 2016, the City of Los Angeles, on behalf of the Ballona Creek Watershed

Management Group, reported fourteen (14) hardness data results including nine (9) dry-weather (261, 188, 250, 334, 405, 312, 460, 439, 213) and five (5) wet-weather (53.4, 30.6, 26.3, 41.6, 17.2) at Centinela Creek monitoring station, CC-CEN. In order to ensure adequate protection of the receiving water, a hardness value (as CaCO₃) of 166.5 mg/L, which is the 50 percentile hardness value of the reported twenty four (24) hardness data, was used for the evaluation of reasonable potential for discharges to Centinela Creek (Discharge Points 001 and 003) from the Facility.

The following table summarizes the applicable water quality criteria/objective for priority pollutants reported in detectable concentrations in the effluents from Discharge Points 001 and 003. These criteria were used to complete the RPA for Discharge Points 001 and 003.

Table F-6. Applicable Water Quality Criteria for Discharge Points 001 and 003

CTR No.	Constituent	Selected (Lowest) Criteria	CTR Water Quality Criteria			
			Freshwater		Human Health for Consumption of:	
			Acute	Chronic	Water & Organisms	Organisms only
			µg/L	µg/L	µg/L	µg/L
1	Antimony	4,300	--	--	N/A	4,300
2	Arsenic	150	340	150		--
3	Beryllium	No criteria	--	--		--
4	Cadmium*	3.67	8.03	3.67		--
5a	Chromium (III)*	314	2836	314		Narrative
5b	Chromium (VI)	11	16	11		--
6	Copper*	14.42	22.63	14.42		---
7	Lead*	6.09	156.24	6.09		Narrative
8	Mercury	0.051	--	--		0.051
9	Nickel*	80.29	722	80.29		4,600
10	Selenium	5	--	5		Narrative
13	Zinc*	185	185	185		---
14	Cyanide	5.2	22	5.2		220,000
68	Bis(2-Ethylhexyl)Phthalate	5.9	--	--		5.9

Metal concentrations are expressed as total recoverable

'N/A' indicates the water quality criteria for the protection of human health for the consumption of water and organisms are not applicable.

* For these metals, the CTR criteria are based on a hardness value (as CaCO₃) of 166.5 mg/L.

Ballona Creek Metals TMDL. This metals TMDL were amended on December 5, 2013, Resolution No. R13-010, and it became effective on October 26, 2015. The discharge from the Inglewood Oil Field has been classified as a major discharge because the permitted discharge flow (7.55 MGD) exceeds the threshold of one (1) MGD. The Ballona Creek Metals TMDL includes specific WLAs for some of the major dischargers, the MS4 permittees and CalTrans. However, no site specific WLA has been designated for the Inglewood Oil Field in the TMDL. In Attachment A to Resolution No. R13-010, on Page 5 in the section Waste Load Allocations (for point sources), paragraph 1 reads "Waste load allocations (WLA) are assigned to point sources for Ballona Creek and Sepulveda Canyon Channel. A grouped mass-based waste load allocation is developed for the storm water permittees (Los Angeles County MS4, Caltrans, General Construction and General

Industrial) by subtracting the load allocation from the total loading capacity. Concentration-based waste load allocations are developed for other point sources in the watershed.” Inglewood Oil Field is a point source to Ballona Creek, one of the other point sources in the watershed which is referenced. Hence, the Facility requires an effluent limit developed using the appropriate WLA. The TMDL includes concentration-based dry-weather and wet weather WLA for other permits discharging to Ballona Creek. These concentration-based WLAs have been used to develop effluent limits for discharges from the Inglewood Oil Field. This permit implements the applicable WLAs as required in the TMDL, by applying the effluent limitation calculations provided in Section 1.4 of the SIP. Concentration-based WLAs for copper, lead, and zinc are applicable to discharges from Discharge Points 002, 004, 005, and 006 that enter Ballona Creek. This Metals TMDL for Ballona Creek is not applicable to the discharges to Centinela Creek because Centinela Creek is not listed as impaired for the targeted constituents and it flows into Ballona Creek Estuary.

The following table summarizes the dry and wet weather WLAs for copper, lead, and zinc included in the Ballona Creek TMDL that are applicable to the Facility’s discharge through Discharge Points 002, 004, 005 and 006 to Ballona Creek Reach 2.

Table F-7. Applicable TMDL Waste Load Allocations for Discharge Points 002, 004, 005 and 006

Parameter	Units	Waste Load Allocation	
		Dry-Weather	Wet-Weather
Copper, Total Recoverable	µg/L	35.56	13.70
Lead, Total Recoverable	µg/L	19.65	76.75
Zinc, Total Recoverable	µg/L	446.55	104.77

Ballona Creek Estuary Toxic Pollutants TMDL. The TMDL was amended by Resolution No. R13-010 that was adopted by the Regional Water Board on December 5, 2013; State Water Board, and OAL approvals were received on June 17, 2014, and May 5, 2015, respectively. The revised TMDL became effective on October 26, 2015 upon approval of U.S. EPA. The Ballona Creek Estuary Toxic Pollutants TMDL assigned concentration-based WLAs for sediments with respect to cadmium, copper, lead, silver, zinc, chlordane, DDTs, and total PCBs to the minor NPDES permits that regulate discharges to Ballona Creek or its tributaries. A WLA for total PAHs is not included in the revised TMDL because recent data indicate that PAHs are not present at levels exceeding existing numeric targets and are not considered stressors of the designated beneficial use. This permit implements the applicable WLAs as required in this TMDL.

3. Determining the Need for WQBELS

In accordance with Section 1.3 of the SIP, the Regional Water Board conducts a reasonable potential analysis (RPA) for each priority pollutant with an applicable criterion or objective to determine if a WQBEL is required in the permit. The Regional Water Board analyzes effluent and receiving water data and identifies the maximum observed effluent concentration (MEC) and maximum background concentration (B) in the receiving water for each constituent. To determine reasonable potential, the MEC and the B are then compared with the applicable water quality objectives (C) outlined in the CTR, NTR, as well as the Basin Plan. For all pollutants that have a reasonable potential to cause or contribute to an excursion above a state water quality standard, numeric WQBELS are required.

Section 1.3 of the SIP provides the procedures for determining reasonable potential to exceed applicable water quality criteria and objectives. The SIP specifies three triggers to complete a RPA:

1. Trigger 1 – if $MEC \geq C$, a limit is needed.
2. Trigger 2 – If the background concentration $B > C$ and the pollutant is detected in the effluent, a limit is needed.
3. Trigger 3 – If other related information such as CWA 303(d) listing for a pollutant, discharge type, compliance history, or other applicable factors indicate that a WQBEL is required.

Sufficient effluent and receiving water data are needed to conduct a complete RPA. If data are not sufficient, the Discharger will be required to gather the appropriate data for the Regional Water Board to conduct the RPA. Upon review of the data, and if the Regional Water Board determines that WQBELs are needed to protect the beneficial uses, the permit will be reopened for appropriate modification. The RPA was performed using available priority pollutant data collected by the Discharger at each Monitoring Location from March 2013 through August 2017. Receiving water data collected by the Discharger during the same period in Ballona Creek and Centinela Creek were also considered.

In addition to the RPA results, the Metals TMDL for Ballona Creek (Resolution No. R13-010) establishes both dry-weather and wet-weather WLAs for point source dischargers to Ballona Creek for copper, lead and zinc. The Regional Water Board developed WQBELs for wet-weather copper, lead, and zinc, and dry-weather copper, lead, and zinc based on the waste load allocations included in the Ballona Creek Metals TMDL. The dry-weather and wet-weather effluent limitations for these pollutants at Discharge Points 002, 004, 005 and 006 were established regardless of whether there is reasonable potential for the pollutants to be present in the discharge at levels that would cause or contribute to a violation of water quality standards. The development of water quality-based effluent limitations for these pollutants are pursuant to 40 C.F.R. section 122.44(d)(1)(vii), which does not require or contemplate a reasonable potential analysis for effluent limitations consistent with the assumption and requirements of a TMDL WLA. Similarly, the SIP at Section 1.3 recognizes that reasonable potential analysis is not appropriate if a TMDL has been developed. The numeric target portion of the Metals TMDL for Ballona Creek (Resolution No. R13-010) specifies when the wet-weather and dry-weather criteria are applicable. Wet-weather effluent limitations are applicable when the flow in Ballona Creek is 64 cubic feet per second (cfs) or greater. Dry-weather effluent limitations are applicable when the flow in Ballona Creek is less than 64 cfs.

The following table summarizes results from the RPA:

Table F-8. RPA Summary

Parameter	MEC ² (µg/L) (MEC)	CTR WQC ³ (µg/L) (C)	Receiving Water Conc. (µg/L) (B)	WLAs in Ballona Creek Metals TMDL ⁷	Reasonable Potential	Rational

NR = Not Reported; DNQ = Detected, but Not Quantified; ND = Not Detected.

- ¹ Concentration expressed as total recoverable.
- ² MEC is the maximum effluent concentration observed from March 2013 through August 2017.
- ³ CTR Water Quality Criteria (WQC) is the most stringent applicable WQC contained in the CTR based on a hardness value of 166.5 mg/L as CaCO₃ (see Table F-6).
- ⁴ Reasonable potential does not exist because both the MEC and receiving water concentration are less than the applicable water quality criteria.
- ⁵ Reasonable potential does exist because the MEC is greater than or equal to the applicable water quality criteria.
- ⁶ Concentration expressed in total chromium.
- ⁷ Dry-weather and wet-weather waste load allocations (WLA) assigned to the minor permits in the Ballona Creek Metals TMDL (Resolution No. R13-010) are used in this permit. The dry-weather and wet-weather effluent limitations for these pollutants at Discharge Points 002, 004, 005 and 006 were established regardless of whether or not there is reasonable potential for the pollutants to be present in the discharge at levels that would cause or contribute to a violation of water quality standards.

4. WQBEL Calculations

- a. If reasonable potential exists to exceed applicable water quality criteria or objectives, then a WQBEL must be established in accordance with one or more of the three procedures contained in section 1.4 of the SIP. These procedures include:
 - i. If applicable and available, use the WLA established as part of a TMDL.
 - ii. Use of a steady-state model to derive maximum daily effluent limitations (MDELs) and average monthly effluent limitations (AMELs).
 - iii. Where sufficient effluent and receiving water data exist, use of a dynamic model, which has been approved by the Regional Water Board.
- b. WQBELs for copper, lead, and zinc for both dry weather and wet weather through Discharge Points 002, 004, 005 and 006 have been calculated using the WLAs provided in the Metals TMDL for Ballona Creek (Resolution No. R13-010) and the procedures specified in Section 1.4 of the SIP.
- c. The WQBELs for copper, lead and zinc at Discharge Point 001 and 003, bis(2-ethylhexyl) phthalate at Discharge Point 001, selenium at Discharge Point 002, and mercury at Discharge Point 006 are established based on CTR criteria and following the procedures based on the steady-state model in accordance to section 1.4 of the SIP.
- d. Since many of the streams in the Region have minimal upstream flows, mixing zones and dilution credits are usually not appropriate. No dilution credit is included in this Order. However, in accordance with the reopener provision in section VI.C.1.f of this Order, it may be reopened upon the submission by the Discharger of adequate information to establish appropriate dilution credits or a mixing zone, as determined by the Regional Water Board.
- e. WQBELs Calculation Example
Using total recoverable lead for Discharge Point 001 and total recoverable copper for Discharge Point 002 as examples, the following demonstrates how WQBELs were established for this Order. The example of copper indicates how WLAs in the Ballona Creek Metals TMDL are included in the development of WQBELs. The tables in Attachments J summarize the development and calculation of all WQBELs for this Order using the process described below. The process for developing these limits is in accordance with section 1.4 of the SIP.

Concentration-Based Effluent Limitations

Two sets of AMEL and MDEL values are calculated separately, one set for the protection of aquatic life and the other for the protection of human health. The AMEL and MDEL limitations for aquatic life and human health are compared, and the most restrictive AMEL and the most restrictive MDEL are selected as the WQBEL.

Lead WQBEL at Discharge Point 001 (Discharges to Centinela Creek)

Calculation of aquatic life AMEL and MDEL for lead

Step 1: For each constituent requiring an effluent limit, identify the applicable water quality criteria or objective. For each criterion, determine the effluent concentration allowance (ECA) using the following steady state equation:

$$ECA = C + D(C-B) \quad \text{when } C > B, \text{ and}$$

$$ECA = C \quad \text{when } C \leq B$$

Where: C = The priority pollutant criterion/objective, adjusted if necessary for hardness, pH, and translators. In this Order, a hardness value of 150 mg/L (as CaCO₃) was used for development of hardness-dependent criteria for Discharge Point 001.

D = The dilution credit

B = The ambient background concentration

As discussed above, this Order does not allow dilution; therefore:

$$ECA = C$$

For total recoverable lead, the applicable water quality criteria are (reference Table F-6):

$$ECA_{\text{Acute (lead)}} = 156.24 \mu\text{g/L}$$

$$ECA_{\text{Chronic (lead)}} = 6.09 \mu\text{g/L}$$

Step 2: For each ECA based or aquatic life criterion/objective, determine the long-term average discharge condition (LTA) by multiplying the ECA by a factor (multiplier). The multiplier is a statistically based factor that adjusts the ECA to account for effluent variability. The value of the multiplier varies depending on the coefficient of variation (CV) of the data set and whether it is an acute or chronic criterion/objective. Table 1 of the SIP provides pre-calculated values for the multipliers based on the value of the CV. Equations to develop the multipliers in place of using values in the tables are provided in section 1.4, Step 3 of the SIP and will not be repeated here.

$$LTA_{\text{acute}} = ECA_{\text{acute}} \times \text{Multiplier}_{\text{acute99}}$$

$$LTA_{\text{chronic}} = ECA_{\text{chronic}} \times \text{Multiplier}_{\text{chronic99}}$$

The CV for the data set must be determined before the multipliers can be selected and will vary depending on the number of samples and the standard deviation of a data set. If the data set is less than 10 samples, or at least 80% of the samples in the data set are reported as non-detect, the CV shall be set equal to 0.6. If the data set is greater than 10 samples, and at least 20% of the samples in the data set are reported as detected, the CV shall be equal to the standard deviation of the data set divided by the average of the data set.

For total recoverable lead, because the data set includes 10 samples, the calculated CV is equal to 1.874 (standard deviation divided by the average). The following calculated ECA multipliers using equations provided in Section 1.4, Step 3 of the SIP were used to develop the acute and chronic LTAs. Table 1 of the SIP also provides this data up to three decimals.

No. of Samples	CV	ECA Multiplier _{acute}	ECA Multiplier _{chronic}
10	1.874	0.1222	0.2162

$$LTA_{acute(lead)} = 156.24 \mu\text{g/L} \times 0.1222 = 19.09 \mu\text{g/L}$$

$$LTA_{chronic(lead)} = 6.09 \mu\text{g/L} \times 0.2162 = 1.317 \mu\text{g/L}$$

Step 3: Select the most limiting (lowest) of the LTA.

$$LTA = \text{most limiting of } LTA_{acute} \text{ or } LTA_{chronic}$$

For total recoverable lead, the $LTA_{chronic}$ is selected as it is the most limiting.

$$LTA = LTA_{chronic(lead)} = 1.317 \mu\text{g/L}$$

Step 4: Calculate the WQBELs by multiplying the LTA by a factor (multiplier). WQBELs are expressed as AMEL and MDEL. The multiplier is a statistically based factor that adjusts the LTA for the averaging periods and exceedance frequencies of the criteria/objectives and the effluent limitations. The value of the multiplier varies depending on the probability basis, the CV of the data set, the number of samples (for AMEL) and whether it is a monthly or daily limit. Table 2 of the SIP provides pre-calculated values for the multipliers based on the value of the CV and the number of samples. Equations to develop the multipliers in place of using values in the tables are provided in section 1.4, Step 5 of the SIP and will not be repeated here.

$$AMEL_{aquatic\ life} = LTA \times AMEL_{multiplier95}$$

$$MDEL_{aquatic\ life} = LTA \times MDEL_{multiplier99}$$

AMEL multipliers are based on a 95th percentile occurrence probability, and the MDEL multipliers are based on the 99th percentile occurrence probability. If the number of samples is less than four (4) per month, the default number of samples to be used is four (4).

For total recoverable lead, the following data were used to develop the AMEL and MDEL for effluent limitations using equations provided in section 1.4, Step 5 of the SIP (Table 2 of the SIP also provides this data up to two decimals):

No. of Samples Per Month	CV	Multiplier _{MDEL99}	Multiplier _{AMEL95}
4	1.874	8.182	2.694

Total recoverable lead

$$AMEL_{(lead)} = 1.317 \mu\text{g/L} \times 2.694 = 3.547 \mu\text{g/L}$$

$$MDEL_{(lead)} = 1.317 \mu\text{g/L} \times 8.182 = 10.77 \mu\text{g/L}$$

Calculation of human health AMEL and MDEL for lead

Step 5: For the ECA based on human health, set the AMEL equal to the $ECA_{Human\ Health}$.

$$AMEL_{\text{Human Health}} = ECA_{\text{Human Health}}$$

For total recover lead, there is no numeric human health criteria. Therefore, this procedure is not applicable.

Step 6: Calculate the MDEL for human health by multiplying the AMEL in Step 5 by the ratio of Multiplier_{MDEL} to the Multiplier_{AMEL}. Table 2 of the SIP provides pre-calculated ratios to be used in this calculation based on the CV and the number of samples.

$$MDEL_{\text{Human Health}} = AMEL_{\text{Human Health}} \times (\text{Multiplier}_{\text{MDEL}} / \text{Multiplier}_{\text{AMEL}})$$

This procedure is not applicable for lead.

Step 7: Select the lower set of the AMEL and MDEL based on aquatic life criteria or human health criteria as the WQBEL for the Order.

Final WQBELs for Lead:

AMEL _{aquatic life}	MDEL _{aquatic life}	AMEL _{human health}	MDEL _{human health}
3.547	10.77	N/A	N/A

The lowest (most restrictive) effluent limits are incorporated into the Order

$$AMEL_{\text{lead}} = 3.547 \text{ } \mu\text{g/L}$$

$$MDEL_{\text{lead}} = 10.77 \text{ } \mu\text{g/L}$$

Since the discharge from the Facility is not continuous, average monthly effluent limitations (AMELs) are not prescribed in the Order. The calculated MDEL for lead at Discharge Point 001 will apply to both wet and dry weather conditions.

Copper WQBELs at Discharge Point 002 (Discharges to Ballona Creek Reach 2)

Calculation of aquatic life AMEL and MDEL for copper

Step 1: For each constituent requiring an effluent limit, identify the applicable water quality criteria or objective. For each criterion, determine the effluent concentration allowance (ECA) using the steady state equation as described in Step 1 for lead above.

When a WLA has been established through a TMDL for a parameter, the WLA is set equal to the ECA.

For total recoverable copper, the applicable water quality criterion is from the Ballona Creek Metals TMDL WLAs. The dry-weather WLAs are based on chronic CTR criteria. The wet-weather WLAs are based on acute CTR criteria. Thus, for total recoverable copper the applicable WLAs are (reference Table F-7):

$$WLA_{\text{wet-weather}} = 13.7 \text{ } \mu\text{g/L} = ECA_{\text{acute (copper)}}$$

$$WLA_{\text{dry-weather}} = 35.56 \text{ } \mu\text{g/L} = ECA_{\text{chronic (copper)}}$$

Step 2: For each ECA based on aquatic life criterion/objective, determine the long-term average discharge condition (LTA) by multiplying the ECA by a factor (multiplier). Table 1 of the SIP provides pre-calculated values for the multipliers based on the value of the CV. Equations to develop the multipliers in place of using values in the tables are provided in Section 1.4, Step 3 of the SIP.

$$LTA_{\text{acute}} = ECA_{\text{acute}} \times \text{Multiplier}_{\text{acute}}$$

$$LTA_{\text{chronic}} = ECA_{\text{chronic}} \times \text{Multiplier}_{\text{chronic}}$$

The CV for the data set must be determined before the multipliers can be selected and will vary depending on the number of samples and the standard deviation of a data set. If the data set is less than 10 samples, or at least 80% of the samples in the data set are reported as non-detect, the CV shall be set equal to 0.6. Since the data set for copper is less than 10 samples, the CV is set equal to 0.6.

For wet-weather total recoverable copper, because the data set includes 10 samples (greater than 10 samples), the calculated CV is equal to 1.571 (standard deviation divided by the average). The corresponding multiplier is as follows:

No. of Samples	CV	ECA Multiplier _{acute 99}
10	1.571	0.139

$$LTA_{acute} = ECA_{acute} \times Multiplier_{acute\ 99}$$

$$LTA_{acute\ (wet-weather\ copper)} = 13.70\ \mu\text{g/L} \times 0.139 = 1.904\ \mu\text{g/L}$$

For dry-weather total recoverable copper, because only one sample result is available, the CV is set equal to 0.6. The corresponding multiplier is as follows:

No. of Samples	CV	ECA Multiplier _{chronic 99}
None	0.6 (default)	0.527

$$LTA_{chronic} = ECA_{chronic} \times Multiplier_{chronic\ 99}$$

$$LTA_{chronic\ (dry-weather\ copper)} = 35.56\ \mu\text{g/L} \times 0.527 = 18.74\ \mu\text{g/L}$$

Step 3: Select the most limiting (lowest) of the LTA.

Since acute criteria will be used to develop the wet-weather effluent limitations and chronic criteria will be used to develop the dry-weather effluent limitations we only have one criterion for each condition, thus both LTAs (wet and dry) will be used.

Step 4: Calculate the WQBELs by multiplying the LTA by a factor (multiplier). WQBELs are expressed as AMEL and MDEL. The multiplier is a statistically based factor that adjusts the LTA for the averaging periods and exceedance frequencies of the criteria/objectives and the effluent limitations. The value of the multiplier varies depending on the probability basis, the CV of the data set, the number of samples (for AMEL) and whether it is a monthly or daily limit. Table 2 of the SIP provides pre-calculated values for the multipliers based on the value of the CV and the number of samples.

$$AMEL_{aquatic\ life} = LTA_{copper} \times AMEL_{multiplier95}$$

$$MDEL_{aquatic\ life} = LTA_{copper} \times MDEL_{multiplier99}$$

AMEL multipliers are based on a 95th percentile occurrence probability, and the MDEL multipliers are based on the 99th percentile occurrence probability. If the number of samples is less than four (4) per month, the default number of samples to be used is four (4).

For total recoverable copper, the following data were used to develop the AMEL and MDEL for effluent limitations using equations provided in section 1.4, Step 5 of the SIP (Table 2 of the SIP also provides this data up to two decimals):

No. of Samples Per Month	Discharge Condition	CV	Multiplier _{MDEL99}	Multiplier _{AMEL95}
4 (default)	Wet weather	1.571	7.19	2.46

No. of Samples Per Month	Discharge Condition	CV	Multiplier _{MDEL99}	Multiplier _{AMEL95}
4 (default)	Dry weather	0.6	3.11	1.55

Total recoverable copper (wet-weather)

$$AMEL_{\text{wet-weather}} = 1.904 \mu\text{g/L} \times 2.46 = 4.68 \mu\text{g/L}$$

$$MDEL_{\text{wet-weather}} = 1.904 \mu\text{g/L} \times 7.19 = 13.69 \mu\text{g/L}$$

Total recoverable copper (dry-weather)

$$AMEL_{\text{dry-weather}} = 18.74 \mu\text{g/L} \times 1.55 = 29.05 \mu\text{g/L}$$

$$MDEL_{\text{dry-weather}} = 18.74 \mu\text{g/L} \times 3.11 = 58.28 \mu\text{g/L}$$

Calculation of human health AMEL and MDEL for Copper

Step 5: For the ECA based on human health, set the AMEL equal to the ECA_{Human Health}:

$$AMEL_{\text{Human Health}} = ECA_{\text{Human Health}}$$

This step is not applicable for the permit because none of the criteria for the provided WLAs are based on human health criteria.

$$AMEL_{\text{human health (copper)}} = ECA_{\text{human health (copper)}} = \text{Not Available}$$

Step 6: Calculate the MDEL for human health by multiplying the AMEL by the ratio of Multiplier_{MDEL} to the Multiplier_{AMEL}. Table 2 of the SIP provides pre-calculated ratios to be used in this calculation based on the CV and the number of samples.

$$MDEL_{\text{human health}} = AMEL_{\text{human health}} \times (\text{Multiplier}_{\text{MDEL}} / \text{Multiplier}_{\text{AMEL}})$$

This step is not applicable for the permit because none of the criteria for the provided WLAs are based on human health criteria.

Step 7: Select the lower of the AMEL and MDEL based on aquatic life and human health as the WQBELs for the Order.

For the parameters subject to the Metals TMDL, such as copper, a comparison is not necessary and the effluent limitations are applied directly:

Final WQBELs for copper

AMEL _{wet}	MDEL _{wet}	AMEL _{dry}	MDEL _{dry}
4.68 μg/L*	13.69 μg/L	29.05 μg/L*	58.28 μg/L

The wet-weather based effluent limitations are applicable when the maximum daily flow in Ballona Creek is 64 cfs or more. The dry-weather effluent limitations are applicable when the maximum daily flow in Ballona Creek is less than 64 cfs.

Since the discharge from the Facility is not continuous, average monthly effluent limitations (AMELs) are not prescribed in the Order.

Final WQBELs are summarized in Table F-9 of this Fact Sheet.

5. WQBELs Based on Basin Plan Objectives

The Basin Plan states that the discharge shall not cause the following in the receiving water:

- The normal ambient pH to fall below 6.5 nor exceed 8.5 units.

- Depress the concentration of dissolved oxygen below 5.0 mg/L anytime nor shall the mean annual concentration of dissolved oxygen fall below 7 mg/L.

To meet the water quality objectives in the Basin Plan and to protect the beneficial uses of the receiving water, the above requirements are included as effluent or receiving water limitations in the Order. The Basin Plan also contains water quality bacteria objectives for the protection of contact recreation beneficial use. This Order includes receiving water limitations for *E. coli* in order to protect the contact water recreation (REC-1) beneficial use of the receiving water.

Other constituents addressed in the Basin Plan were evaluated as follows:

- Ammonia.** The ammonia objectives in the Basin Plan were amended by Resolution Nos. 2002-011 and 2005-014 by the Regional Water Board. The ammonia objectives were determined based on pH and temperature in the receiving water. Because of insufficient data (less than 5 data points) for pH and temperature in the receiving water, the RPA for ammonia was not conducted. To obtain sufficient data, this Order increases the monitoring frequency for pH and temperature in the receiving from yearly to quarterly.
- Temperature.** The Basin Plan identifies numeric temperature objectives consistent with the Thermal Plan. A white paper was developed by Regional Water Board staff entitled *Temperature and Dissolved Oxygen Impacts on Biota in Tidal Estuaries and Enclosed Bays in the Los Angeles Region*. The white paper evaluated the optimum temperatures for steelhead, topsmelt, ghost shrimp, brown rock crab, jackknife clam, and blue mussel. This Order includes an instantaneous effluent temperature limitation of 86° F, which was based on the findings included in the white paper.
- Total Suspended Solids.** The Basin Plan requires that, "Waters shall not contain suspended or settleable material in concentrations that cause nuisance or adversely affect beneficial uses." This narrative objective has been translated into a numeric effluent limit, based on U.S. EPA's Quality Criteria for Water (commonly known as the "Gold Book"). In the Gold Book, U.S. EPA notes that "In a study downstream from a discharge where inert suspended solids were increased to 80 mg/L, the density of macroinvertebrates decreased by 60 percent...". This indicates that suspended solids concentrations of 80 mg/L in the receiving water resulted in adverse effects to aquatic life. An effluent limitation of 75 mg/L (daily maximum) is included in this Order. This effluent limitation is protective of the narrative objective for TSS and is based on BPJ.
- Turbidity.** The Basin Plan requirements for turbidity are as follows:
 - where natural turbidity is between 0 and 50 NTU, increases shall not exceed 20%.
 - where natural turbidity is greater than 50 NTU, increases shall not exceed 10%.

This order applies the water quality objective for turbidity as a receiving water limitation in addition to a technology-based effluent limitation based on BPJ.

6. Whole Effluent Toxicity (WET)

Whole effluent toxicity (WET) protects the receiving water quality from the aggregate toxic effect of a mixture of pollutants in the effluent. WET tests measure the degree of response of exposed aquatic test organisms to an effluent. The WET approach allows for protection of the narrative "no toxics in toxic amounts" criterion while implementing numeric criteria for toxicity. There are two types of WET tests: acute and chronic. An acute toxicity test is conducted over a short time period and measures mortality. A chronic toxicity test is

conducted over a longer period of time and may measure mortality, reproduction, and growth.

The Basin Plan specifies a narrative objective for toxicity, requiring that all waters be maintained free of toxic substances in concentrations that are lethal to or produce other detrimental responses by aquatic organisms. Detrimental responses include, but are not limited to: decreased growth rate, decreased reproductive success of resident or indicator species, and/or significant alterations in population, community ecology, or receiving water biota. Order No. R4-2013-0021 contains acute toxicity limitations and monitoring requirements in accordance with the Basin Plan, in which the acute toxicity limitation dictates that the average survival in undiluted effluent for any three consecutive 96-hour static or continuous flow bioassay tests shall be at least 90%, with no single test having less than 70% survival. The effluent acute toxicity data reported by the Discharger from March 2013 through August 2017 showed only one noncompliance (67% survival) occurred on February 7, 2017 at Discharge Point 004. It indicates that toxicity may be present in the discharge.

Chronic toxicity is a more stringent requirement than acute toxicity. A chemical at a low concentration can have chronic effects but no acute effects. Because discharge from the Facility may include a number of pollutants, which individually may not be present in toxic concentrations while exhibiting aggregated toxic effects as a whole, this Order prescribes a chronic toxicity effluent limitation and requires chronic toxicity monitoring of the effluent at all Discharge Points. The whole effluent toxicity testing is evaluated using U.S. EPA's 2010 Test of Significant Toxicity (TST) statistical approach. In 2010, U.S. EPA endorsed the peer-reviewed TST statistical approach in the National Pollutant Discharge Elimination System Test of Significant Toxicity Implementation Document (EPA 833-R-10-003, 2010) as an improved statistical tool to evaluate data from U.S. EPA's toxicity test methods. The TST statistical approach is the superior statistical approach for addressing statistical uncertainty when used in combination with U.S. EPA's toxicity test methods and is implemented in federal permits issued by U.S. EPA Region 9.

The TST's null hypothesis for chronic toxicity is:

H_0 : Mean response (In-stream Waste Concentration (IWC) in % effluent) \leq (0.75 x mean response (Control)).

Results obtained from a chronic toxicity test are analyzed using the TST statistical approach and an acceptable level of chronic toxicity is demonstrated by rejecting the null hypothesis and reporting "Pass" or "P". Chronic toxicity results are expressed as "Pass" or "Fail" and "% Effect". The chronic toxicity IWC for all Discharge Points is 100 percent effluent. The MDEL for chronic toxicity is exceeded and a violation will be flagged when a chronic toxicity test, analyzed at the IWC using the TST statistical approach, results in "Fail" and the Percent Effect is \geq 50%.

Order No. R4-2013-0021 contained final effluent limitations and monitoring requirements for acute toxicity. This Order instead includes monitoring requirements and effluent limitations for chronic toxicity, consistent with the Basin Plan. Chronic toxicity is a more stringent requirement than acute toxicity, and it evaluates the mortality endpoint as does the acute toxicity testing as well as deleterious effects such as reductions in growth and reproduction which will likely occur prior to mortality.

7. Final WQBELs

Table F-9. Water Quality-based Effluent Limitations for Discharge Points 001 through 006

Parameter	Units	Effluent Limitations			
		Average Monthly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
Discharge Points 001, 002, 003, 004, 005 and 006					
Biochemical Oxygen Demand (BOD) (5-day @ 20°C)	mg/L	--	30	--	--
Oil and Grease	mg/L	--	15	--	--
pH	pH unit	--	--	6.5	8.5
Temperature	deg. F	--	--	--	86
Total Suspended Solids (TSS)	mg/L	--	75	--	--
Turbidity	NTU	--	75	--	--
Chronic Toxicity ¹	Pass or Fail, % Effect	--	Pass or % Effect < 50	--	--
Total Petroleum Hydrocarbons (TPH) ²	µg/L	--	100	--	--
Discharge Point 001 - Discharge to Centinela Creek					
Copper, Total Recoverable (All-weather)	µg/L	--	23	--	--
Lead, Total Recoverable (All-weather)	µg/L	--	10.8	--	--
Zinc, Total Recoverable (All-weather)	µg/L	--	185	--	--
Cyanide	µg/L	--	8.5	--	--
Bis(2-Ethylhexyl)Phthalate	µg/L	--	12	--	--
Discharge Point 003 - Discharge to Centinela Creek					
Copper, Total Recoverable (All-weather)	µg/L	--	23	--	--
Lead, Total Recoverable (All-weather)	µg/L	--	10	--	--
Zinc, Total Recoverable (All-weather)	µg/L	--	185	--	--
Discharge Points 002, 004, 005 and 006 - Discharges to Ballona Creek Reach 2					
Copper, Total Recoverable (Dry-weather) ³	µg/L	--	58	--	--
Lead, Total Recoverable (Dry-weather) ³	µg/L	--	32	--	--
Zinc, Total Recoverable (Dry-weather) ³	µg/L	--	733	--	--

Parameter	Units	Effluent Limitations			
		Average Monthly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum
Copper, Total Recoverable (Wet-weather) ³	µg/L	--	14	--	--
Lead, Total Recoverable (Wet-weather) ³	µg/L	--	77	--	--
Zinc, Total Recoverable (Wet-weather) ³	µg/L	--	105	--	--
Discharge Point 002 - Discharge to Ballona Creek Reach 2					
Selenium, Total Recoverable (All-weather)	µg/L	--	8.7	--	--
Discharge Point 006 - Discharge to Ballona Creek Reach 2					
Mercury, Total Recoverable (All-weather)	µg/L	--	0.10	--	--

1. The maximum daily effluent limitation (MDEL) shall be reported "Pass" or "Fail" and "% Effect". The MDEL is exceeded when a toxicity test results in a "Fail," and the percent effect is greater than or equal to 0.50. Report "Pass" or "Fail" and "% Effect" for Maximum Daily Effluent Limitation (MDEL).
2. TPH equals the sum of TPH gasoline (C4-C12), TPH diesel (C13-C22), and TPH waste oil (C23+).
3. Dry-weather effluent limitations are applicable when the maximum daily flow in Ballona Creek is less than 64 cubic feet per second (cfs). Wet-weather effluent limitations are applicable when the maximum daily flow in Ballona Creek is equal to or greater than 64 cfs.

D. Final Effluent Limitation Considerations

Technology-based effluent limitations for BOD, settleable solids, oil and grease, TPH, and turbidity are included in this Order, based on a review of Facility operations and BPJ. WQBELs for cyanide and bis(2-ethylhexyl)phthalate at Discharge Point 001, selenium at Discharge Point 002, copper, lead and zinc at Discharge Points 001 and 003 and mercury at discharge Point 006 are included in this permit based on the presence of reasonable potential for these constituents in the data set collected from March 2013 to August 2017; these effluent limitations are derived based on CTR criteria and SIP procedures. Effluent limitations for dry and wet weather copper, lead and zinc at Discharge Points 002, 004, 005 and 006 are developed in accordance with the Ballona Creek Metals TMDL. A chronic toxicity effluent limitation (evaluated using the TST statistical approach), which is a more stringent requirement than the acute toxicity limitation, is included in this Order in lieu of an acute toxicity effluent limitation. Effluent limitations for TSS, temperature and pH are included in this Order in accordance with the Basin Plan.

Refer to Attachment J for a summary of the RPA and associated effluent limitation calculations.

1. Anti-Backsliding Requirements

Sections 402(o) and 303(d)(4) of the CWA and federal regulations at 40 C.F.R. section 122.44(l) prohibit backsliding in NPDES permits. These anti-backsliding provisions require effluent limitations in a reissued permit to be as stringent as those in the previous permit, with some exceptions where limitations may be relaxed. Certain effluent limitations established in this Order are at least as stringent as the requirements and limitations of Order No. R4-2013-0121. The exceptions include the removal of the acute toxicity and phenols effluent limitations at all discharge points, the removal of selenium effluent limitations at Discharge Points 001, 003 through 006, the removal of mercury effluent limitation at Discharge Points 001 and 002, modifications of the dry weather copper, lead

and zinc and wet weather lead effluent limitations at Discharge Points 002, 004, 005 and 006, and modifications of all weather lead effluent limitations at Discharge Points 001 and 003 and all weather zinc at Discharge Point 001.

As discussed in Section IV.C.6 of this Attachment, Order No. R4-2013-0021 contained acute toxicity limitations based on Basin Plan objectives. This Order includes a chronic toxicity effluent limitation evaluated using the TST statistical approach, and requires chronic toxicity monitoring for the effluent at Discharge Points 001 through 006. A chemical at a low concentration can have chronic effects but no acute effects; chronic toxicity is protective of both the numeric and the narrative acute toxicity Basin Plan water quality objectives. As chronic toxicity is a more stringent requirement than acute toxicity, the inclusion of a chronic toxicity limit replacing the acute toxicity effluent limitation is consistent with the anti-backsliding requirements of the CWA and federal regulations. Hence, the removal of the acute toxicity effluent limitation does not constitute backsliding.

The effluent limitations for phenols were included in historical Orders for the discharge and are no longer applicable. Order No. R4-2013-0021 retained the limitations from prior permits based on the presence of phenols in historical discharges from the Facility during prior permit term. During the term of Order No. R4-2013-0021, the Discharger installed storm water treatment systems at each discharge point. Also, all effluent monitoring results (16 data points) from all discharge points collected during the term of Order No. R4-2013-0021 are all non-detects, and the method detection limits for phenols were all lower than the effluent limitations for phenols. CWA section 402(o)(2) allows backsliding where material and substantial alterations or additions to the permitted facility occurred after permit issuance, or new information (other than revised regulations, guidance, or test methods) becomes available that was not available at the time of permit issuance and that would have justified a less stringent effluent limitation. The removal of the effluent limitations for phenols complies with the exception to the anti-backsliding requirements because of Facility modifications during the term of Order No. R4-2013-0021 and the availability of new information (monitoring data) that was not available at the time when Order No. R4-2013-0021 was adopted, which demonstrates that there is no reasonable potential for the applicable water quality criteria to be exceeded. Therefore, removing the effluent limitations for phenols is appropriate and complies with the exception to the anti-backsliding requirements. The Discharger is required to monitor phenols in future discharges as per the MRP.

The removal of selenium effluent limitations at Discharge Points 001, 003 through 006, and the removal of mercury effluent limitations at Discharge Points 001 and 002 are based on the results of reasonable potential analyses using the monitoring data from March 2013 to August 2017, all of which were not available at the time of the prior permit issuance. These pollutants do not have a reasonable potential to cause or contribute to an excursion above a state water quality standard. Therefore, removing the effluent limitations for selenium and mercury at the specified discharge points is appropriate and complies with the exception to the anti-backsliding requirements. Dry and wet weather selenium effluent limitations in Order No. R4-2013-0021 for Discharge Points 002, 004, 005 and 006 were based on the WLAs for selenium in the previous version of Ballona Creek Metals TMDLs. Since the selenium WLAs were removed in the amended Ballona Creek Metals TMDL (Resolution No. R13-010) indicating that the water body is no longer impaired for selenium, selenium effluent limitations for Discharge Points 002, 004, 005 and 006 based on WLAs are no longer applicable. However, based on the presence of reasonable potential for selenium at Discharge Point 002, an all weather effluent limitation for selenium at Discharge Point 002 was established using CTR criteria and the SIP procedures. The relaxation in the selenium effluent limitation at Discharge Point 002 reflected "new

information” that was not available during the prior permit issuance and it complies with the exception to the anti-backsliding requirements.

Effluent limitations for dry weather and wet weather copper, lead and zinc at Discharge Points 002, 004, 005 and 006 are modified in this Order and are consistent with modifications of requirements included in the Ballona Creek Metals TMDL in Resolution No. R13-010 which became effective on October 26, 2015. These requirements were developed subsequent to the adoption of Order No. R4-2013-0021. The information on which the effluent limitations included in this Order were based is new information that was not available at the time of the prior permit issuance and would have justified the application of less stringent effluent limitations for dry weather copper, lead and zinc and for wet weather lead at Discharge Points 002, 004, 005 and 006. Moreover, the cumulative effect of the WLAs will result in attaining the beneficial uses of the receiving water. As such, the relaxation is consistent with both Section 402 of the CWA and CWA section 303(d)(4)(A). Section 303(d)(4)(A) allows for the establishment of a less stringent effluent limitation based on a TMDL WLA when the receiving water has been identified as not meeting applicable water quality standards (i.e., a nonattainment water) and the TMDL WLA is part of an overall strategy for achieving attainment. Pursuant to Section 402(o)(2) of the CWA, the relaxation in effluent limitations for lead and zinc at Discharge Point 001 and for lead at Discharge Point 003 are consistent with anti-backsliding requirements because they reflect “new information” (the receiving water hardness and the new CVs based on reported data) that was not available during the prior permit issuance.

2. Antidegradation Policies

40 C.F.R. section 131.12 requires that the state water quality standards include an anti-degradation policy consistent with the federal policy. The State Water Board established California’s antidegradation policy in State Water Board Resolution No. 68-16. Resolution No. 68-16 incorporates the federal antidegradation policy where the federal policy applies under federal law. Resolution No. 68-16 requires that existing water quality be maintained unless degradation is justified based on specific findings. The Regional Water Board’s Basin Plan implements, and incorporates by reference, both the State and federal antidegradation policies. Compliance with these requirements will result in the use of best practicable treatment or control of the discharge and ensures that any discharges permitted herein will not violate the antidegradation policies.

The relaxation of effluent limitations for copper (dry weather), lead (dry and wet weather) and zinc (dry weather) at Discharge Points 002, 004, 005 and 006 in this Order will not result in the degradation of high quality waters because these limitations are developed based on the Ballona Creek Metals TMDL WLAs and the cumulative effect of the WLAs are expected to result in attaining the beneficial uses of the receiving water.

The selenium limitations at Discharge Point 002 in the 2013 Order were more stringent because they were developed based on the WLA for selenium in the 2007 Ballona Creek Metals TMDL. Recent data indicate that selenium is not impairing the beneficial uses and a WLA for selenium is not included in the amended Ballona Creek Metals TMDL (Resolution No. R13-010). The effluent limitations for selenium at Discharge Point 002 in this Order are developed based on CTR criteria and take into consideration the new monitoring data for selenium at Discharge Point 002. Although these new limitations for selenium are less stringent, compliance with these effluent limitations will ensure selenium concentrations in the discharge meet CTR water quality based effluent limitations and protect the beneficial uses of the receiving water.

The effluent limitations for copper, lead and zinc at Discharge Points 001 and 003 in this Order are developed based on CTR criteria with the application of a new receiving water

hardness of 166.5 mg/L. This hardness value was determined using monitoring data reported by the Discharger during the last permit term and by the City of Los Angeles from November 2015 to December 2016. The hardness value used was based on new information. Compliance with these effluent limitations will ensure concentrations of these pollutant in the receiving water meet CTR criteria and protect the beneficial uses of the receiving water. Therefore, the effluent limitations for copper, lead and zinc at Discharge Points 001 and 003 are consistent with the state's antidegradation policy.

The effluent monitoring conducted during the term of Order No. R4-2013-0021 resulted in non-detected values for phenols with method detection limits below the effluent limitation for phenols contained in Order No. R4-2013-0021. Hence, there is no reasonable potential for the concentration of phenols in the discharge to cause or contribute to an exceedance of the water quality objective. The removal of selenium effluent limitations at Discharge Points 001, 003 through 006, and the removal of mercury effluent limitations at Discharge Points 001 and 002 will not result in the degradation of the receiving water because the removal of the effluent limitations are based on no reasonable potential for these pollutants to cause or contribute to an excursion above a state water quality standard.

In summary, the permitted discharge is not a new discharge. This Order does not provide for an increase in the permitted design flow at any discharge point, nor does it allow for a reduction in the level of treatment. The final limitations in this Order, which include concentration based and mass based limitations, hold the Discharger to performance levels that will not adversely impact the beneficial uses or degrade the water quality of the receiving waters, and they are developed consistent with federal guidelines and state regulations. The effluent limitations, receiving water limitations, and effluent and receiving water monitoring requirements ensure that excursions above water quality objectives of the receiving waters will be apparent and can be addressed immediately. Further, compliance with these requirements will result in the use of best practicable treatment or control of the discharge.

Finally, the State Water Board issued Administrative Procedures Update 90-004 (APU 90-004), which provides guidance for the Regional Boards for implementing State Board Resolution No. 68-16, State Antidegradation Policy. Regarding circumstances when antidegradation analyses are required, APU 90-004 states that a complete antidegradation analysis is not required when reduction of water quality is temporally limited and will not result in any long-term deleterious effects on water quality. Since the impact on the receiving water caused by the storm water discharges from the Facility is short-term and will cease after a storm event is over, it will not result in any long-term deleterious effects on receiving water quality. Based on the above analysis, the storm water discharges are consistent with federal and state antidegradation policies.

3. Mass-based Effluent Limitations

Generally, mass-based effluent limitations ensure that proper treatment, and not dilution, is employed to comply with the final effluent concentration limitations. 40 C.F.R. 122.45(f)(1) requires that all permit limitations, standards or prohibitions be expressed in terms of mass units except under the following conditions: (1) for pH, temperature, radiation or other pollutants that cannot appropriately be expressed by mass limitations; (2) when applicable standards or limitations are expressed in terms of other units of measure; or (3) if in establishing technology-based permit limitation on a case-by-case basis, limitation based on mass are infeasible because the mass or pollutant cannot be related to a measure of production.

Mass-based effluent limitations are established using the following formula:

$$\text{Mass (lbs/day)} = \text{flow rate (MGD)} \times 8.34 \times \text{effluent limitation (mg/L)}$$

where: Mass = mass limitation for a pollutant (lbs/day)

Effluent limitation = concentration limit for a pollutant (mg/L)

Flow rate = discharge flow rate (MGD)

The mass-based effluent limitations are calculated based on the permitted discharge flow from the respective discharge point.

4. Stringency of Requirements for Individual Pollutants

This Order contains both technology-based and water quality-based effluent limitations for individual pollutants. The technology-based effluent limitations consist of restrictions for BOD, settleable solids, oil and grease, TPH, and turbidity. Restrictions on these pollutants are discussed in section IV.B of the Fact Sheet. This Order’s technology-based pollutant restrictions implement the minimum, applicable federal technology-based requirements.

Water quality-based effluent limitations have been derived to implement water quality objectives that protect beneficial uses. Both the beneficial uses and the water quality objectives have been approved pursuant to federal law and are the applicable federal water quality standards. To the extent that toxic pollutant WQBELs were derived from the CTR, the CTR is the applicable standard pursuant to 40 C.F.R. section 131.38. The procedures for calculating the individual WQBELs for priority pollutants are based on the CTR implemented by the SIP, which was approved by U.S. EPA on May 18, 2000. Most beneficial uses and water quality objectives contained in the Basin Plan were approved under state law and submitted to and approved by U.S. EPA prior to May 30, 2000. The remaining water quality objectives and beneficial uses implemented by this Order were approved by U.S. EPA and are applicable water quality standards pursuant to section 131.21(c)(2). Collectively, this Order’s restrictions on individual pollutants are no more stringent than required to implement the requirements of the CWA.

5. Summary of Final Effluent Limitations

Table F-10a. Summary of Final Effluent Limitations for Discharge Point 001

Parameter	Units	Effluent Limitations				Basis ¹
		Average Monthly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum	
Conventional Pollutants						
Biochemical Oxygen Demand (BOD) (5-day @ 20 deg. C)	mg/L	--	30	--	--	E, BPJ
	lbs/day ²	--	167	--	--	
Oil and Grease	mg/L	--	15	--	--	E, BPJ
	lbs/day ²	--	83	--	--	
pH	s.u.	--	--	6.5	8.5	E, BP
Total Suspended Solids (TSS)	mg/L	--	75	--	--	BPJ
	lbs/day ²	--	417	--	--	
Non-Conventional Pollutants						
Chronic Toxicity ³	Pass or Fail, % Effect	--	Pass or % Effect < 50	--	--	BP
Settleable Solids	ml/L	--	0.3	--	--	BPJ
Temperature	deg. F	--	--	--	86	E, BP, WP, TP

Parameter	Units	Effluent Limitations				Basis ¹
		Average Monthly	Maximum Daily	Instantaneous Minimum	Instantaneous Maximum	
Turbidity	NTU		75	--	--	BPJ
Total Petroleum Hydrocarbons (TPH) ⁴	µg/L	--	100	--	--	BPJ
	lbs/day ²	--	0.56	--	--	
Priority Pollutants						
Copper , Total Recoverable (All-weather)	µg/L	--	23	--	--	CTR, SIP
	lbs/day ²	--	0.13	--	--	
Lead, Total Recoverable (All-weather)	µg/L	--	10.8	--	--	CTR, SIP
	lbs/day ²	--	0.060	--	--	
Zinc, Total Recoverable (All-weather)	µg/L	--	185	--	--	CTR, SIP
	lbs/day ²	--	1.03	--	--	
Cyanide, Total (as CN)	µg/L	--	8.5	--	--	CTR, SIP

Zinc, Total Recoverable (Wet-weather) ⁵	µg/L	--	105	--	--	TMDL
	lbs/day ¹	--	0.53	--	--	

- ¹ E= Order No. R4-2013-0021; BPJ = Best Professional Judgment; BP = Basin Plan; CTR = California Toxics Rule; SIP = State Implementation Policy; TMDL = Total Maximum Daily Loads (Resolution No. R13-010); WP = White Paper; and TP= Thermal Plan.
- ² Mass loading limitations are based on the permitted flow at Discharge Point 006 (0.6 million gallons per day (MGD)) and are calculated as follows:
Flow (MGD) x Concentration (mg/L) x 8.34 (conversion factor) = lbs/day.
- ³ The maximum daily effluent limitation (MDEL) shall be reported as “Pass” or “Fail” and “% Effect”. The MDEL is exceeded when a toxicity test results in a “Fail,” and the percent effect is greater than or equal to 0.50. Report “Pass” or “Fail” and “% Effect” for Maximum Daily Effluent Limitation (MDEL).
- ⁴ TPH equals the sum of TPH gasoline (C₄-C₁₂), TPH diesel (C₁₃-C₂₂), and TPH waste oil (C₂₃₊).
- ⁵ Dry-weather effluent limitations are applicable when the maximum daily flow in Ballona Creek is less than 64 cubic feet per second (cfs). Wet-weather effluent limitations are applicable when the maximum daily flow in Ballona Creek is equal to or greater than 64 cfs.

E. Interim Effluent Limitations – Not Applicable

F. Land Discharge Specifications – Not Applicable

G. Recycling Specifications – Not Applicable

V. RATIONALE FOR RECEIVING WATER LIMITATIONS

A. Surface Water

The Basin Plan contains numeric and narrative water quality objectives applicable to all surface waters within the Los Angeles Region. Water quality objectives include an objective to maintain the high quality waters pursuant to federal regulations (40 C.F.R. section 131.12) and State Water Board Resolution No. 68-16 (the anti-degradation policies). Receiving water limitations in this Order are included to ensure protection of the beneficial uses of the receiving water. If there is reasonable potential or a U.S. EPA-approved TMDL WLA, then WQBELs are included in this Order to ensure protection of those water quality standards.

B. Groundwater – Not Applicable

VI. RATIONALE FOR PROVISIONS

A. Standard Provisions

Standard Provisions, which apply to all NPDES permits in accordance with 40 C.F.R. section 122.41, and additional conditions applicable to specified categories of permits in accordance with 40 C.F.R. section 122.42, are provided in Attachment D. The Discharger must comply with all standard provisions and with those additional conditions that are applicable under section 122.42.

Sections 122.41(a)(1) and (b) through (n) of 40 C.F.R. establish conditions that apply to all state-issued NPDES permits. These conditions must be incorporated into the permits either expressly or by reference. If incorporated by reference, a specific citation to the regulations must be included in the Order. 40 C.F.R. section 123.25(a)(12) allows the state to omit or modify conditions to impose more stringent requirements. In accordance with 40 C.F.R. section 123.25, this Order omits federal conditions that address enforcement authority specified in 40 C.F.R. sections 122.41(j)(5) and (k)(2) because the enforcement authority under the Water Code is more stringent. In lieu of these conditions, this Order incorporates by reference Water Code section 13387(e).

B. Special Provisions

1. Reopener Provisions

These provisions are based on 40 C.F.R part 123 and Order No. R4-2013-0021. The Regional Water Board may reopen the permit to modify permit conditions and

requirements. Causes for modifications include the promulgation of new federal regulations, modification in toxicity requirements, or adoption of new regulations by the State Water Board or Regional Water Board, including revisions to the Basin Plan or adoption of applicable TMDLs associated with the receiving water.

2. Special Studies and Additional Monitoring Requirements

- a. **Initial Investigation Toxicity Reduction Evaluation (TRE) Workplan.** This provision is based on section 4 of the SIP, Toxicity Control Provisions, which establishes minimum toxicity control requirements for implementing the narrative toxicity objective for aquatic life protection established in the basin plans of the State of California.
- b. **Effluent Sediment Monitoring.** The Discharger shall monitor the effluent sediments to demonstrate compliance with the sediment limitations as listed in Table 5 of the Order as per the Ballona Creek Estuary Toxic Pollutants TMDL. Since the TSS concentration in the final discharge may be less than the TSS effluent limitation of 75 mg/L, a large volume of effluent sample may be required to gather enough sediments for the required analyses (metals and organics). Therefore, high resolution analytical methods (EPA approved) may be used to analyze specific constituents in the sediments. The Discharger may submit a work plan for Executive Officer's approval if high resolution analytical methods will be used for sediment analyses.

3. Best Management Practices and Storm Water Pollution Prevention

- a. **Storm Water Pollution Prevention Plan (SWPPP).** This Order requires the Discharger to update, as necessary, and continue to implement a SWPPP. The SWPPP will outline site-specific management processes for minimizing storm water runoff contamination and for preventing trash and contaminated storm water runoff from being discharged directly into the receiving water. At a minimum, the management practices should ensure that raw materials and chemicals do not come into contact with storm water, and to prevent the entrainment of trash in storm water that is discharged through Discharge Points. SWPPP requirements are included as Attachment G, based on 40 C.F.R. section 122.44(k).
- b. **Best Management Practices Plan (BMPP).** This Order requires the Discharger to develop and implement a BMPP. The BMPP may be included as a component of the SWPPP. 40 C.F.R. section 122.44(k) requires that permits include best management practices when reasonably necessary to achieve the effluent limitations and standards or to carry out the purpose and intent of the CWA. Consistent with 40 C.F.R. section 122.44(k), this Order requires the Discharger to update and implement a BMPP. The purpose of the BMPP is to establish site-specific procedures that minimize the potential of hazardous waste/materials and other contaminants to discharge to surface waters. The BMPP shall incorporate the requirements contained in Attachment G. Attachment G requires a discussion on the effectiveness of each BMP to reduce or prevent pollutants in storm water discharges. The BMPP may be included in the SWPPP.
- c. **Spill Contingency Plan (SCP).** This Order requires the Discharger to develop and implement a SCP to control the discharge of pollutants. The SCP shall include a technical report on the preventive (failsafe) and contingency (cleanup) plans for controlling accidental discharges, and for minimizing the effect of such events at the site. This provision is included in this Order to minimize and control the amount of pollutants discharged in case of a spill. The SCP shall be site specific and shall cover all areas of the Facility. A Spill Prevention, Control, and Countermeasure (SPCC) Plan may satisfy this requirement.

4. Construction, Operation, and Maintenance Specifications

This provision is based on the requirements of 40 C.F.R section 122.41(e).

5. Other Special Provisions – Not Applicable

6. Compliance Schedules – Not Applicable

VII. RATIONALE FOR MONITORING AND REPORTING REQUIREMENTS

CWA section 308 and 40 C.F.R. sections 122.41(h), (j)-(l), 122.44(i), and 122.48 require that all NPDES permits specify monitoring and reporting requirements. Water Code sections 13267 and 13383 also authorize the Regional Water Board to establish monitoring, inspection, entry, reporting, and recordkeeping requirements. The Monitoring and Reporting Program (MRP), Attachment E of this Order establishes monitoring, reporting, and recordkeeping requirements that implement federal and state requirements. The following provides the rationale for the monitoring and reporting requirements contained in the MRP for this Facility.

A. Influent Monitoring – Not Applicable

B. Effluent Monitoring

Effluent monitoring for pollutants expected to be present in the discharge will be required at Monitoring Locations EFF-001 through EFF-006 as prescribed in the MRP (Attachment E). To demonstrate compliance with established effluent limitations, monitoring frequency for those pollutants with effluent limitations is once per discharge event, but no more than once per week or any 7-day period. These parameters include total flow, pH, temperature, BOD, oil and grease, settleable solids, TSS, turbidity, TPH, mercury, copper, lead, selenium, zinc, bis(2-ethylhexyl)phthalate and cyanide. Chronic toxicity monitoring is required once per year at each discharge point if a discharge occurs at that location. Monitoring for additional pollutants including ammonia, nitrite, nitrate, E coli, methyl tertiary butyl ether (MTBE) and phenols is also required once per year based on considerations of pollutants commonly associated with similar operations.

The SIP states that the Regional Water Board will require periodic monitoring for pollutants for which criteria or objectives apply and for which no effluent limitations have been established. This Order requires the Discharger to conduct annual monitoring for the remaining CTR priority pollutants, including TCDD equivalents, at each discharge point, if a discharge occurs at that location during the year. The Regional Water Board will use the additional data to conduct an RPA and determine if additional WQBELs are required. The Regional Water Board may reopen the permit to incorporate additional effluent limitations and requirements, if necessary.

To implement the requirements in the Toxic Pollutants TMDL for Ballona Creek Estuary, this Order requires annual sediment monitoring at each discharge point if any storm water runoff is discharged during that year.

C. Whole Effluent Toxicity Testing Requirements

Whole effluent toxicity (WET) protects the receiving water quality from the aggregate toxic effect of a mixture of pollutants in the effluent. A chronic toxicity test measures mortality, reproduction, and growth. A chemical at a low concentration can have chronic effects but no acute effects. Chronic toxicity is a more stringent requirement than acute toxicity. For this Order, chronic toxicity monitoring in the discharge is required. The chronic toxicity testing results are analyzed using U.S. EPA's 2010 TST statistical approach.

D. Receiving Water Monitoring

1. Surface Water Monitoring

The SIP requires monitoring of the receiving water for the CTR priority pollutants, including TCDD equivalents, to determine reasonable potential. This Order requires the Discharger to monitor the receiving water for pH, temperature, hardness, turbidity, dissolved oxygen, ammonia, and priority pollutants (including TCDD equivalents) of the receiving water at upstream Monitoring Stations (RSW-001 and RSW-003) once per year. Additionally, the Discharger must analyze pH, temperature, hardness, turbidity, dissolved oxygen, ammonia and E coli at the downstream Monitoring Stations (RSW-002 and RSW-004) to determine compliance with the receiving water limitations. Semiannual monitoring for pH, temperature and ammonia in the downstream monitoring stations is required for the determination of compliance with the ammonia water quality objective in the receiving water. The pH and temperature data in the receiving waters are required in the establishment of ammonia effluent limitations if the effluent ammonia concentration demonstrates the presence of a reasonable potential in the future.

The Discharger must provide maximum daily flow data in the Ballona Creek with the quarterly monitoring reports for the days when discharges occur at the Facility. Flow data for the Ballona Creek is currently monitored between Sawtelle Boulevard and Sepulveda Boulevard by the Los Angeles County Department of Public Works at Stream Gage No. F38C-R. This station is designated as RSW-005 in this Order. This information is necessary to determine the wet-weather and dry-weather conditions as defined in the Ballona Creek Metals TMDL.

2. Groundwater – Not Applicable

E. Other Monitoring Requirements

1. Storm Water Monitoring

The discharge is comprised of storm water runoff. As such, the Discharger is required to measure and record the rainfall each day of the month. The Discharger is also required to conduct visual observations of all storm water discharges to observe the presence of floating and suspended materials, trash, oil and grease, discoloration, turbidity, and odor.

VIII. PUBLIC PARTICIPATION

The Regional Water Board has considered the issuance of WDRs that will serve as an NPDES permit for the Lubricating Specialties Company, Pico Rivera Facility. As a step in the WDR adoption process, the Regional Water Board staff has developed tentative WDRs and has encouraged public participation in the WDR adoption process.

A. Notification of Interested Parties

The Regional Water Board notified the Discharger and interested agencies and persons of its intent to prescribe WDRs for the discharge and provided an opportunity to submit written comments and recommendations. Notification was provided through the following: email and local newspaper; and documents relevant to the tentative permit were also available on the Regional Water Board website. Similarly, the public had access to the agenda and any changes in dates and locations through the Regional Water Board's website at:

<http://www.waterboards.ca.gov/losangeles>.

B. Written Comments

Interested persons were invited to submit written comments concerning the tentative WDRs as provided through the notification process. Comments were required to be submitted either in

person or by mail to the Executive Officer at the Regional Water Board at 320 West 4th Street, Suite 200, Los Angeles, CA 90013, or by email to losangeles@waterboards.ca.gov with a copy to jauren.chen@waterboards.ca.gov.

To be fully responded to by staff and considered by the Regional Water Board, the written comments were due at the Regional Water Board office by 5:00 p.m. January 5, 2018.

C. Public Hearing

The Regional Water Board held a public hearing on the tentative WDRs during its regular Board meeting on the following date and time and at the following location:

Date: February 8, 2018
Time: 9:00 a.m.
Location: Metropolitan Water District, Board Room
700 North Alameda Street,
Los Angeles, California

Interested persons were invited to attend. At the public hearing, the Regional Water Board heard testimony pertinent to the discharge, WDRs, and permit. For accuracy of the record, important testimony was requested in writing.

D. Reconsideration of Waste Discharge Requirements

Any person aggrieved by this action of the Regional Water Board may petition the State Water Board to review the action in accordance with Water Code section 13320 and California Code of Regulations, title 23, sections 2050 and following. The State Water Board must receive the petition by 5:00 p.m., within 30 calendar days of the date of adoption of this Order at the following address, except that if the thirtieth day following the date of this Order falls on a Saturday, Sunday, or state holiday, the petition must be received by the State Water Board by 5:00 p.m. on the next business day:

State Water Resources Control Board
Office of Chief Counsel
P.O. Box 100
Sacramento, CA 95812-0100

Or by email to: waterqualitypetitions@waterboards.ca.gov

For instructions on how to file a petition for review, see

http://www.waterboards.ca.gov/public_notices/petitions/water_quality/wqpetition_instr.shtml.

E. Information and Copying

The Report of Waste Discharge (ROWD), tentative WDRs, comments received, and other supporting documents are on file and the electronic copies may be assessed in the CIWQS database or on the Los Angeles Regional Water Quality Control Board website at www.waterboards.ca.gov/losangeles. Hard copies may be inspected at the Regional Water Board's office at any time between 8:30 a.m. and 4:45 p.m., Monday through Friday. Viewing and copying of documents may be arranged through the Regional Water Board by calling (213) 576 – 6600.

F. Register of Interested Persons

Any person interested in being placed on the mailing list for information regarding the WDRs and NPDES permit should contact the Regional Water Board, reference this Facility, and provide a name, address, and phone number.

G. Additional Information

Requests for additional information or questions regarding this Order should be directed to Jau Ren Chen at jauren.chen@waterboards.ca.gov or at (213)576-6656.

ATTACHMENT G – STORM WATER POLLUTION PREVENTION PLAN REQUIREMENTS

I. IMPLEMENTATION SCHEDULE

A storm water pollution prevention plan (SWPPP) shall be developed and submitted to the Regional Water Board within 90 days following the adoption of this Order. The SWPPP shall be implemented for each facility covered by this Permit within 10 days of approval from the Regional Water Board, or no later than 90 days from the date of the submittal of the SWPPP to the Regional Water Board (whichever comes first).

II. OBJECTIVES

The SWPPP has two major objectives: (a) to identify and evaluate sources of pollutants associated with industrial activities that may affect the quality of storm water discharges and authorized non-storm water discharges from the facility; and (b) to identify and implement site-specific best management practices (BMPs) to reduce or prevent pollutants associated with industrial activities in storm water discharges and authorized non-storm water discharges. BMPs may include a variety of pollution prevention measures or other low-cost and pollution control measures. They are generally categorized as non-structural BMPs (activity schedules, prohibitions of practices, maintenance procedures, and other low-cost measures) and as structural BMPs (treatment measures, run-off controls, overhead coverage.) To achieve these objectives, facility operators should consider the five phase process for SWPPP development and implementation as shown in Table A.

The SWPPP requirements are designed to be sufficiently flexible to meet the needs of various facilities. SWPPP requirements that are not applicable to a facility should not be included in the SWPPP.

A facility's SWPPP is a written document that shall contain a compliance activity schedule, a description of industrial activities and pollutant sources, descriptions of BMPs, drawings, maps, and relevant copies or references of parts of other plans. The SWPPP shall be revised whenever appropriate and shall be readily available for review by facility employees or Regional Water Board inspectors.

III. PLANNING AND ORGANIZATION

A. Pollution Prevention Team

The SWPPP shall identify a specific individual or individuals and their positions within the facility organization as members of a storm water pollution prevention team responsible for developing the SWPPP, assisting the facility manager in SWPPP implementation and revision, and conducting all monitoring program activities required in Attachment E of this Permit. The SWPPP shall clearly identify Permit-related responsibilities, duties, and activities of each team member. For small facilities, storm water pollution prevention teams may consist of one individual where appropriate.

B. Review Other Requirements and Existing Facility Plans

The SWPPP may incorporate or reference the appropriate elements of other regulatory requirements. Facility operators should review all local, state, and federal requirements that impact, complement, or are consistent with the requirements of this permit. Facility operators should identify any existing facility plans that contain storm water pollutant control measures or relate to the requirements of this Permit. As examples, facility operators whose facilities are subject to Federal Spill Prevention Control and Countermeasures' requirements should already have instituted a plan to control spills of certain hazardous materials. Similarly, facility operators

whose facilities are subject to air quality related permits and regulations may already have evaluated industrial activities that generate dust or particulates.

IV. SITE MAP

The SWPPP shall include a site map. The site map shall be provided on an 8-½ x 11 inch or larger sheet and include notes, legends, and other data as appropriate to ensure that the site map is clear and understandable. If necessary, facility operators may provide the required information on multiple site maps.

**TABLE A
FIVE PHASES FOR DEVELOPING AND IMPLEMENTING INDUSTRIAL
STORM WATER POLLUTION PREVENTION PLANS**

PLANNING AND ORGANIZATION Form Pollution Prevention Team Review other plans
ASSESSMENT PHASE Develop a site map Identify potential pollutant sources Inventory of materials and chemicals List significant spills and leaks Identify non-storm water discharges Assess pollutant risks
BEST MANAGEMENT PRACTICES IDENTIFICATION PHASE Non-structural BMPs Structural BMPs Select activity and site-specific BMPs
IMPLEMENTATION PHASE Train employees Implement BMPs Conduct recordkeeping and reporting
EVALUATION / MONITORING Conduct annual site evaluation Review monitoring information Evaluate BMPs Review and revise SWPPP

The following information shall be included on the site map:

- A. The facility boundaries; the outline of all storm water drainage areas within the facility boundaries; portions of the drainage area impacted by run-on from surrounding areas; and direction of flow of each drainage area, on-site surface water bodies, and areas of soil erosion. The map shall also identify nearby water bodies (such as rivers, lakes, and ponds) and municipal storm drain inlets where the facility's storm water discharges and authorized non-storm water discharges may be received.
- B. The location of the storm water collection and conveyance system, associated points of discharge, and direction of flow. Include any structural control measures that affect storm water discharges, authorized non-storm water discharges, and run-on. Examples of structural control measures are catch basins, berms, detention ponds, secondary containment, oil/water separators, diversion barriers, etc.
- C. An outline of all impervious areas of the facility, including paved areas, buildings, covered storage areas, or other roofed structures.
- D. Locations where materials are directly exposed to precipitation and the locations where significant spills or leaks identified in section VI.A.4 below have occurred.
- E. Areas of industrial activity. This shall include the locations of all storage areas and storage tanks, shipping and receiving areas, fueling areas, vehicle and equipment storage/maintenance areas, material handling and processing areas, waste treatment and disposal areas, dust or particulate generating areas, cleaning and rinsing areas, and other areas of industrial activity which are potential pollutant sources.

V. LIST OF SIGNIFICANT MATERIALS

The SWPPP shall include a list of significant materials¹ handled and stored at the site. For each material on the list, describe the locations where the material is being stored, received, shipped, and handled, as well as the typical quantities and frequency. Materials shall include raw materials, intermediate products, final or finished products, recycled materials, and waste or disposed materials.

VI. DESCRIPTION OF POTENTIAL POLLUTANT SOURCES

- A. The SWPPP shall include a narrative description of the facility's industrial activities, as identified in section IV.E above, associated potential pollutant sources, and potential pollutants that could be discharged in storm water discharges or authorized non-storm water discharges. At a minimum, the following items related to a facility's industrial activities shall be considered:
 - 1. **Industrial Processes.** Describe each industrial process, the type, characteristics, and quantity of significant materials used in or resulting from the process, and a description of the manufacturing, cleaning, rinsing, recycling, disposal, or other activities related to the process. Where applicable, areas protected by containment structures and the corresponding containment capacity shall be described.
 - 2. **Material Handling and Storage Areas.** Describe each handling and storage area, type, characteristics, and quantity of significant materials handled or stored, description of the shipping, receiving, and loading procedures, and the spill or leak prevention and response

¹ "Significant materials" includes, but is not limited to: raw materials; fuels; materials such as solvents, detergents, and plastic pellets; finished materials such as metallic products; raw materials used in food processing or production; hazardous substances designated under Section 101(14) of Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA); any chemical the facility is required to report pursuant to Section 313 of Title III of Superfund Amendments and Reauthorization Act (SARA); fertilizers; pesticides; and waste products such as ashes, slag, and sludge that have the potential to be released with storm water discharges.

procedures. Where applicable, areas protected by containment structures and the corresponding containment capacity shall be described.

3. **Dust and Particulate Generating Activities.** Describe all industrial activities that generate dust or particulates that may be deposited within the facility's boundaries and identify their discharge locations; the characteristics of dust and particulate pollutants; the approximate quantity of dust and particulate pollutants that may be deposited within the facility boundaries; and a description of the primary areas of the facility where dust and particulate pollutants would settle.
4. **Significant Spills and Leaks.** Describe materials that have spilled or leaked in significant quantities in storm water discharges or authorized non-storm water discharges since April 17, 1994. Include toxic chemicals (listed in 40 Code of Federal Regulations (C.F.R.) part 302) that have been discharged to storm water as reported on U.S. Environmental Protection Agency (U.S. EPA) Form R, and oil and hazardous substances in excess of reportable quantities (see 40 C.F.R., parts 110, 117, and 302).

The description shall include the type, characteristics, and approximate quantity of the material spilled or leaked, the cleanup or remedial actions that have occurred or are planned, the approximate remaining quantity of materials that may be exposed to storm water or non-storm water discharges, and the preventative measures taken to ensure spill or leaks do not reoccur. Such list shall be updated as appropriate during the term of this Permit.

5. **Non-Storm Water Discharges.** Facility operators shall investigate the facility to identify all non-storm water discharges and their sources. As part of this investigation, all drains (inlets and outlets) shall be evaluated to identify whether they connect to the storm drain system.

All non-storm water discharges shall be described. This shall include the source, quantity, frequency, and characteristics of the authorized non-storm water discharges and associated drainage area.

Non-storm water discharges that are not authorized by this Permit, other waste discharge requirements, or other NPDES permits are prohibited. The SWPPP must include BMPs to prevent or reduce contact of authorized non-storm water discharges with significant materials (as defined in Footnote 1 of section V above) or equipment.

6. **Soil Erosion.** Describe the facility locations where soil erosion may occur as a result of industrial activity, storm water discharges associated with industrial activity, or authorized non-storm water discharges.
7. **Trash.** Describe the facility locations where trash may be generated as a result of facility operations and on-site activities.

- B. The SWPPP shall include a summary of all areas of industrial activities, potential pollutant sources, and potential pollutants. This information should be summarized similar to Table B. The last column of Table B, "Control Practices", should be completed in accordance with section VIII. below.

VII. ASSESSMENT OF POTENTIAL POLLUTANT SOURCES

- A. The SWPPP shall include a narrative assessment of all industrial activities and potential pollutant sources as described in section VI above to determine:
 1. Which areas of the facility are likely sources of pollutants in storm water discharges and authorized non-storm water discharges, and

2. Which pollutants are likely to be present in storm water discharges and authorized non-storm water discharges. Facility operators shall consider and evaluate various factors when performing this assessment such as current storm water BMPs; quantities of significant materials handled, produced, stored, or disposed of; likelihood of exposure to storm water or authorized non-storm water discharges; history of spill or leaks; and run-on from outside sources.
- B.** Facility operators shall summarize the areas of the facility that are likely sources of pollutants and the corresponding pollutants that are likely to be present in storm water discharges and authorized non-storm water discharges.

Facility operators are required to develop and implement additional BMPs as appropriate and necessary to prevent or reduce pollutants associated with each pollutant source. The BMPs will be narratively described in section VIII below.

VIII. STORM WATER BEST MANAGEMENT PRACTICES

The SWPPP shall include a narrative description of the storm water BMPs to be implemented at the facility for each potential pollutant and its source identified in the site assessment phase (sections VI and VII above). The BMPs shall be developed and implemented to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges. Each pollutant and its source may require one or more BMPs. Some BMPs may be implemented for multiple pollutants and their sources, while other BMPs will be implemented for a very specific pollutant and its source.

TABLE B
EXAMPLE
ASSESSMENT OF POTENTIAL POLLUTION SOURCES AND
CORRESPONDING BEST MANAGEMENT PRACTICES
SUMMARY

Area	Activity	Pollutant Source	Pollutant	Best Management Practices
Vehicle & Equipment Fueling	Fueling	Spills and leaks during delivery. Spills caused by topping off fuel tanks. Hosing or washing down fuel oil fuel area. Leaking storage tanks. Rainfall running off fuel oil, and rainfall running onto and off fueling area.	fuel oil	Use spill and overflow protection. Minimize run-on of storm water into the fueling area. Cover fueling area. Use dry cleanup methods rather than hosing down area. Implement proper spill prevention control program. Implement adequate preventative maintenance program to preventive tank and line leaks. Inspect fueling areas regularly to detect problems before they occur. Train employees on proper fueling, cleanup, and spill response techniques.

The description of the BMPs shall identify the BMPs as (1) existing BMPs, (2) existing BMPs to be revised and implemented, or (3) new BMPs to be implemented. The description shall also include a discussion on the effectiveness of each BMP to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges. The SWPPP shall provide a summary of all BMPs implemented for each pollutant source. This information should be summarized similar to Table B.

Facility operators shall consider the following BMPs for implementation at the facility:

A. Non-Structural BMPs

Non-structural BMPs generally consist of processes, prohibitions, procedures, schedule of activities, etc., that prevent pollutants associated with industrial activity from contacting with storm water discharges and authorized non-storm water discharges. They are considered low technology, cost-effective measures. Facility operators should consider all possible non-structural BMPs options before considering additional structural BMPs (see section VIII.B. below). Below is a list of non-structural BMPs that should be considered:

1. **Good Housekeeping.** Good housekeeping generally consists of practical procedures to maintain a clean and orderly facility.
2. **Preventive Maintenance.** Preventive maintenance includes the regular inspection and maintenance of structural storm water controls (catch basins, oil/water separators, etc.) as well as other facility equipment and systems.
3. **Spill Response.** This includes spill clean-up procedures and necessary clean-up equipment based upon the quantities and locations of significant materials that may spill or leak.
4. **Material Handling and Storage.** This includes all procedures to minimize the potential for spills and leaks and to minimize exposure of significant materials to storm water and authorized non-storm water discharges.
5. **Employee Training.** This includes training of personnel who are responsible for (1) implementing activities identified in the SWPPP, (2) conducting inspections, sampling, and visual observations, and (3) managing storm water. Training should address topics such as spill response, good housekeeping, and material handling procedures, and actions necessary to implement all BMPs identified in the SWPPP. The SWPPP shall identify periodic dates for such training. Records shall be maintained of all training sessions held.
6. **Waste Handling/Recycling.** This includes the procedures or processes to handle, store, or dispose of waste materials or recyclable materials.
7. **Recordkeeping and Internal Reporting.** This includes the procedures to ensure that all records of inspections, spills, maintenance activities, corrective actions, visual observations, etc., are developed, retained, and provided, as necessary, to the appropriate facility personnel.
8. **Erosion Control and Site Stabilization.** This includes a description of all sediment and erosion control activities. This may include the planting and maintenance of vegetation, diversion of run-on and runoff, placement of sandbags, silt screens, or other sediment control devices, etc.
9. **Inspections.** This includes, in addition to the preventative maintenance inspections identified above, an inspection schedule of all potential pollutant sources. Tracking and follow-up procedures shall be described to ensure adequate corrective actions are taken and SWPPPs are made.

10. **Quality Assurance.** This includes the procedures to ensure that all elements of the SWPPP and Monitoring Program are adequately conducted.

B. Structural BMPs.

Where non-structural BMPs as identified in section VIII.A above are not effective, structural BMPs shall be considered. Structural BMPs generally consist of structural devices that reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges. Below is a list of structural BMPs that should be considered:

1. **Overhead Coverage.** This includes structures that provide horizontal coverage of materials, chemicals, and pollutant sources from contact with storm water and authorized non-storm water discharges.
2. **Retention Ponds.** This includes basins, ponds, surface impoundments, bermed areas, etc. that do not allow storm water to discharge from the facility.
3. **Control Devices.** This includes berms or other devices that channel or route run-on and runoff away from pollutant sources.
4. **Secondary Containment Structures.** This generally includes containment structures around storage tanks and other areas for the purpose of collecting any leaks or spills.
5. **Treatment.** This includes inlet controls, infiltration devices, oil/water separators, detention ponds, vegetative swales, etc. that reduce the pollutants in storm water discharges and authorized non-storm water discharges.

IX. ANNUAL COMPREHENSIVE SITE COMPLIANCE EVALUATION

The facility operator shall conduct one comprehensive site compliance evaluation (evaluation) in each reporting period (July 1-June 30). Evaluations shall be conducted within 8-16 months of each other. The SWPPP shall be revised, as appropriate, and the revisions implemented within 10 days of the approval by the Executive Officer or no later than 90 days after submission to the Regional Water Board, whichever comes first. . Evaluations shall include the following:

- A. A review of all visual observation records, inspection records, and sampling and analysis results.
- B. A visual inspection of all potential pollutant sources for evidence of, or the potential for, pollutants entering the drainage system.
- C. A review and evaluation of all BMPs (both structural and non-structural) to determine whether the BMPs are adequate, properly implemented and maintained, or whether additional BMPs are needed. A visual inspection of equipment needed to implement the SWPPP, such as spill response equipment, shall be included.
- D. An evaluation report that includes, (i) identification of personnel performing the evaluation, (ii) the date(s) of the evaluation, (iii) necessary SWPPP revisions, (iv) schedule, as required in section X.E., for implementing SWPPP revisions, (v) any incidents of non-compliance and the corrective actions taken, and (vi) a certification that the facility operator is in compliance with this Permit. If the above certification cannot be provided, explain in the evaluation report why the facility operator is not in compliance with this Permit. The evaluation report shall be submitted as part of the annual report, retained for at least five years, and signed and certified in accordance with Standard Provisions V.B.5 of Attachment D.

X. SWPPP GENERAL REQUIREMENTS

- A. The SWPPP shall be retained on site and made available upon request of a representative of the Regional Water Board and/or local storm water management agency (local agency) which receives the storm water discharges.

- B.** The Regional Water Board and/or local agency may notify the facility operator when the SWPPP does not meet one or more of the minimum requirements of this section. As requested by the Regional Water Board and/or local agency, the facility operator shall submit an SWPPP revision and implementation schedule that meets the minimum requirements of this section to the Regional Water Board and/or local agency that requested the SWPPP revisions. Within 14 days after implementing the required SWPPP revisions, the facility operator shall provide written certification to the Regional Water Board and/or local agency that the revisions have been implemented.
- C.** The SWPPP shall be revised, as appropriate, and implemented prior to changes in industrial activities which (i) may significantly increase the quantities of pollutants in storm water discharge, (ii) cause a new area of industrial activity at the facility to be exposed to storm water, or (iii) begin an industrial activity which would introduce a new pollutant source at the facility.
- D.** The SWPPP shall be revised and implemented in a timely manner, but in no case more than 90 days after a facility operator determines that the SWPPP is in violation of any requirement(s) of this Permit.
- E.** When any part of the SWPPP is infeasible to implement due to proposed significant structural changes, the facility operator shall submit a report to the Regional Water Board prior to the applicable deadline that (i) describes the portion of the SWPPP that is infeasible to implement by the deadline, (ii) provides justification for a time extension, (iii) provides a schedule for completing and implementing that portion of the SWPPP, and (iv) describes the BMPs that will be implemented in the interim period to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges. Such reports are subject to Regional Water Board approval and/or modifications. Facility operators shall provide written notification to the Regional Water Board within 14 days after the SWPPP revisions are implemented.
- F.** The SWPPP shall be provided, upon request, to the Regional Water Board. The SWPPP is considered a report that shall be available to the public by the Regional Water Board under section 308(b) of the Clean Water Act.

ATTACHMENT H – STATE WATER BOARD MINIMUM LEVELS (MICROGRAMS/LITER (µG/L))

The Minimum Levels (MLs) in this Attachment are for use in reporting and compliance determination purposes in accordance with section 2.4 of the State Implementation Policy. These MLs were derived from data for priority pollutants provided by State certified analytical laboratories in 1997 and 1998. These MLs shall be used until new values are adopted by the State Water Board and become effective. The following tables (Tables 2a - 2d) present MLs for four major chemical groupings: volatile substances, semi-volatile substances, inorganics, and pesticides and PCBs.

Table 2a - VOLATILE SUBSTANCES*	GC	GCMS
1,1 Dichloroethane	0.5	1
1,1 Dichloroethylene	0.5	2
1,1,1 Trichloroethane	0.5	2
1,1,2 Trichloroethane	0.5	2
1,1,2,2 Tetrachloroethane	0.5	1
1,2 Dichlorobenzene (volatile)	0.5	2
1,2 Dichloroethane	0.5	2
1,2 Dichloropropane	0.5	1
1,3 Dichlorobenzene (volatile)	0.5	2
1,3 Dichloropropene (volatile)	0.5	2
1,4 Dichlorobenzene (volatile)	0.5	2
Acrolein	2.0	5
Acrylonitrile	2.0	2
Benzene	0.5	2
Bromoform	0.5	2
Methyl Bromide	1.0	2
Carbon Tetrachloride	0.5	2
Chlorobenzene	0.5	2
Chlorodibromo-methane	0.5	2
Chloroethane	0.5	2
Chloroform	0.5	2
Chloromethane	0.5	2
Dichlorobromo-methane	0.5	2
Dichloromethane	0.5	2
Ethylbenzene	0.5	2
Tetrachloroethylene	0.5	2
Toluene	0.5	2
Trans-1,2 Dichloroethylene	0.5	1
Trichloroethene	0.5	2
Vinyl Chloride	0.5	2

*The normal method-specific factor for these substances is 1; therefore, the lowest standard concentration in the calibration curve is equal to the above ML value for each substance.

PCB 1254	0.5
PCB 1260	0.5
Toxaphene	0.5

* The normal method-specific factor for these substances is 100; therefore, the lowest standard concentration in the calibration curve is equal to the above ML value for each substance multiplied by 100.

Techniques:

GC - Gas Chromatography

GCMS - Gas Chromatography/Mass Spectrometry

HRGCMS - High Resolution Gas Chromatography/Mass Spectrometry (i.e., EPA 1613, 1624, or 1625)

LC - High Pressure Liquid Chromatography

FAA - Flame Atomic Absorption

GFAA - Graphite Furnace Atomic Absorption

HYDRIDE - Gaseous Hydride Atomic Absorption

CVAA - Cold Vapor Atomic Absorption

ICP - Inductively Coupled Plasma

ICPMS - Inductively Coupled Plasma/Mass Spectrometry

SPGFAA - Stabilized Platform Graphite Furnace Atomic Absorption (i.e., EPA 200.9)

DCP - Direct Current Plasma

COLOR – Colorimetric

ATTACHMENT J-11

101.2 - Purpose and Intent.

The purpose of this Code is to provide minimum standards to preserve the public health, safety, and general welfare by regulating the design, construction, installation, quality of materials, use, occupancy, location, and maintenance of all buildings, structures, grading, and certain equipment as specifically set forth herein. Consistent with this purpose, the provisions of this Code are intended and always have been intended to confer a benefit on the community as a whole and are not intended to establish a duty of care toward any particular person.

This Code shall not be construed to hold the County of Los Angeles or any officer, employee or agent thereof responsible for any damage to persons or property by reason of any inspection authorized herein or by reason of the issuance or nonissuance of any permit authorized herein, and/or for any action or omission in connection with the application and/or enforcement of this Code. By adopting the provisions of this Code, the County does not intend to impose on itself, its employees or agents any mandatory duties of care toward persons and property within its jurisdiction so as to provide a basis of civil liability for damages.

This Section is declaratory of existing law and is not to be construed as suggesting that such was not the purpose and intent of previous Code adoptions.

(Ord. 2010-0053 § 2, 2010; Ord. 95-0065 § 3 (part), 1995.)

DECLARATION OF SERVICE BY EMAIL

I, the undersigned, declare as follows:

I am a resident of the County of Sacramento and I am over the age of 18 years, and not a party to the within action. My place of employment is 980 Ninth Street, Suite 300, Sacramento, California 95814.

On June 1, 2018, I served the:

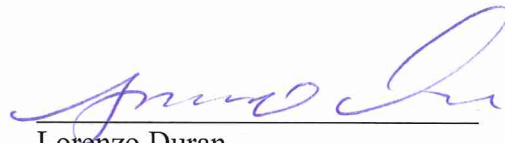

- **SWRCB's and LARWQCB'S Comments on the Test Claim**

California Regional Water Quality Control Board, Los Angeles Region, Order No. R4-2012-0175, 13-TC-01 and 13-TC-02

Cities of Agoura Hills, Bellflower, Beverly Hills, Carson, Cerritos, Commerce, Downey, Huntington Park, Lakewood, Manhattan Beach, Norwalk, Pico Rivera, Rancho Palos Verdes, Redondo Beach, San Marino, Santa Clarita, Santa Fe Springs, Signal Hill, South El Monte, Vernon, Westlake Village, and Whittier, County of Los Angeles, and Los Angeles County Flood Control District, Claimants

By making it available on the Commission's website and providing notice of how to locate it to the email addresses provided on the attached mailing list.

I declare under penalty of perjury under the laws of the State of California that the foregoing is true and correct, and that this declaration was executed on June 1, 2018 at Sacramento, California.

Lorenzo Duran
Commission on State Mandates
980 Ninth Street, Suite 300
